One person out of every thousand of the total population, or one-tenth of 1 percent, belong in the dependent group, requiring hour-by-hour supervision. As adults they do not go beyond a mental age of 3 years (and many do not go that far). Many of them have severe physical handicaps, are unable to walk or to talk; must be fed and clothed. Yet, even in this group some individuals have responded to training along minimum social lines, and these efforts, when successful, decrease the need for personal care and enrich the individual's human existence to the point that he can learn to walk, take care of his bodily needs and dress and feed himself.

Four persons out of every thousand population fall into the middle group of semidependents. Even the upper brackets of this group develop at less than half the rate of normal children, yet many have capabilities for learning self-care, patterns of acceptable social behavior, and performance of useful work. Where these trainable children are given an opportunity to enroll in well-conducted, well-staffed classes, important advances have been achieved.

About 2½ percent of the population, or 25 out of each thousand people, are found in the marginal independent group. As children they are considered educable, but sufficently retarded to require attendance at special classes. Most of them can utilize some vocational guidance and training, and many eventually become at least partially self-supporting adults, capable of managing their own affairs, but they will need counseling in periods of stress and crisis.

In order to obtain a clear picture of the kind of assistance that has been offered to the mentally retarded person to help prepare him for his contribution to himself, his own family, and to society at large, we need to review briefly two necessary areas in his life development—education and training.

EDUCATION

The problem of mental retardation has probably existed since the beginning of man. In the United States the first institutions were organized in Massachusetts and New York about 1850. It was believed at that time the organization of institutions was the solution to the problem. The second development, about 50 years later in 1896, was the establishment of special classes for the educable mentally retarded. Both of these developments have been extended to practically all of the 48 States.¹ Both kinds of organizations—institutions and public school classes for the educable mentally retarded—are still expanding since they have been unable to meet the demands placed upon them.

Fifty lears later, around 1950, we find a third development, the organization of community classes for severely retarded or trainable children, primarily under public school auspices. This third development points up the fact that institutions and public school classes for educable children are not sufficient, and that other provisions are necessary. The efforts of parents to retain their retarded children at home and find community provisions for them has resulted in the organization of classes for trainable children in 18 States.

But the organization of classes for trainable children in communities is not going to solve the problems of all parents who wish to retain their children at home. There will be many others for which provisions are not available. Who is responsible for the preschool severely retarded child in the home? What provisions will be made for him? Since schools admit only school-age children, will the provisions be day-care centers or classes under a welfare agency? Who is responsible for the severely retarded adult at home? Is the sheltered workshop the answer? And who is responsible for the custodial child if the parents refuse to send him to an institution? Who is responsible for the diagnosis and for parent counseling?" (1)

TRAINING

The history of the State-Federal program of vocational rehabilitation in this country dates back to 1920 when the National Civilian Vocational Rehabilitation Act was enacted.

This original act did not provide services for the mentally retarded. With the passage in 1943, of Public Law 113, which became popularly known as the Barden-La Follette amendments, the mentally retarded were included for the first time among those to be provided with rehabilitation services.

"Prior to 1943, the major emphasis in vocational rehabilitation was on training and placement. Medical aspects of rehabilitation, the psychological impact of the disability, counseling, and interviewing, intensive use of community resources—all these accepted tools of vocational rehabilitation today, were not recognized as basic to vocational rehabilitation until the passage of the Barden-La Follette Act." (2)

¹ This report was written prior to Alaska and Hawaii statehood.

The following services are provided throughout the Nation:

Thorough physical examination;

(2) Necessary medical, surgical, psychiatric, and hospital services;

(3) Necessary prosthetic devices, such as artificial limbs, hearing aids, trusses, and the like;

(4) Individual counseling and guidance;

(5) Training for a job in schools, on the job, by correspondence or by tutor or related;

(6) Maintenance and transportation during rehabilitation, if necessary;

7) Necessary tools, equipment, and licenses;

(8) Placement on the right job;

(9) Followup to make sure the worker and the job are properly matched. In 1954, "Executive hearings were conducted by the House Committee on Education and Labor and open hearings by the Senate Committee on Labor and Public Welfare. The result was the passage of Public Law 565 of the 83d Congress, which was signed by President Eisenhower on August 3, 1954." (3)

NONPROFIT WORKSHOPS

Under Public Law 565, otherwise known as the Vocational Rehabilitation Amendments of 1954, the vocational rehabilitation program was greatly expanded through a three-part grant structure, making grants available for (1) support of basic State vocational rehabilitation programs; (2) extension and improvement of rehabilitation services; and (3) support of special projects.

This legislation gave impetus to the growth and development of expanded and improved vocational rehabilitation services for the mentally retarded. Sheltered workshops emerged as a new resource in the total effort to rehabilitate

the potentially employable mentally retarded.

The National Association for Retarded Children reported in 1959 on a nationwide survey it conducted on 56 member units of the NARC Operating Sheltered

Workshops for the Mentally Retarded in 1956-57. (4)

The majority of such programs serve those retardates "who have a reasonable employment potential" through the utilization of the workshop program of service. The three major services rendered by most sheltered workshops include: (1) vocational evaluation; (2) adjustment and vocational training; (3) remunerative employment.

The last report from the office of Vocational Rehabilitation (1958) states that 1,600 mental retardates were rehabilitated for gainful employment as

contrasted with 1, 094 in the previous year.

It has been estimated some 250,000 adult mentally retarded can profit from a sheltered workshop experience. (5) The need for national facilities of this type are obvious when one compares the number of retardates being rehabilitated annually as of today.

Title III of the Rehabilitation Act of 1959—"Workshops and Rehabilitation

Facilities"—would provide for additional facilities of this type.

However, our nationwide workshop experiences reveal that the mentally retarded separate out into four groupings within such vocational rehabilitation training programs;

GROUP DESCRIPTION

Group A: Those retardates able to be successfully placed into competitive employment at the end of their sheltered workshop training.

Group B: Those retardates able to maintain productive roles within the

sheltered workshops.

Group C: Those retardates unable to maintain consistant productivity within the sheltered workshop.

Group D: Those retardates unable to meet sheltered workshop standards. Those retardates in groups C and D require a different type program to meet their needs. Then there are, in addition, a number of severely retarded currently unable to gain admission into sheltered workshops.

INDEPENDENT LIVING CENTERS

In order to serve those retardates in groups C and D as well as those unable to enter into sheltered workshop programs, additional adult programs are required. These retardates will require such programs in the areas of personal and social development which will enable them to become more self-sufficient and selfreliant.

Title II of the Rehabilitation Act of 1959—"Independent Rehabilitation Services"-would establish a program of rehabilitation, constructed in this broader sense. It would enable adult retardates, able to do so, to leave an institution and to achieve such degree of independent living as to dispense with the need for institutional care. It would enable those adult retardates who are homebound to enter into independent living rehabilitation programs thereby largely dispensing with the need for their being attended at home.

If we as a nation are to take advantage of the proposed "independent living" legislation, it becomes imperative that we begin to think now and plan ahead for new facilities and new services for our country's severly retarded adults. Special programs will be required for those unable to become remuneratively employed within the sheltered workshops. New programs will need to place a greater emphasis on an individual's ability to function and to participate within the home, the community and within an adult activity which need not be vocational in nature. "There is a need to make a life rather than a livin". (6)

"For more than 10 years the spotlight in rehabilitation has been on the person with a disability and the team immediately surrounding him. Now the focus should broaden to emphasize the everyday life of the disabled person, his home, community, and the society in which he lives, if we are to insure for him a

satisfying and productive existence". (7)

As necessary as institutionalization may be for some retardates ("about 150,000 persons were in such public institutions at the end of 1957") (8), there is widespread agreement that those able to remain at home and in the com-

munity should be enabled to do so.

Saenger (9) in a comprehensive study of 2,640 severely retarded adults reported that two-thirds "were found to be living in the community * * * A major part of this study was concerned with the home adjustment of the severely retarded. Most had made a good adjustment; one in four participated in everyday family life, took an active interest in the affairs of other family members, and tried to help within the limitations of their ability. About onehalf were able to communicate in a limited way with other family members." Improved medical care, better dietary management, wholesome activities and

work opportunities all seem to contribute to a substantial lengthening of the lifespan of the retarded. Hence it is of the utmost importance to plan now for the anticipated presence in communities of a substantially larger number of older retardates, through hostels and other residential facilities, vocational

opportunities, recreational outlets and appropriate counseling resources.

"I propose that the retarded have the same right as anyone else to be at home and to remain in their communities. This concept implies that, whenever possible, we must minimize the differences between their mode of living and that of others. The greater the likelihood for the retarded to remain with his own family during his childhood, and in his own community as at least a partially contributing member during his adult life, the fuller his life will be. If we agree on this principle, then we must admit that his separation from his family or his community is likely to be a sign of failure, either on his part or on the part of those responsible for his care." (10)

Certainly there is no comparison to the cost involved in providing independent living rehabilitation services to the costs of institutionalization. When one reviews the cost of institutionalization "The average maintenance expenditure

per patient (in 1957) was \$1,279.67." (11)

Though there are no accurate figures on the costs of building new institutions, a few costs of recent buildings might be helpful to indicate what part of these costs are-

(1) Arkansas Children's Colony______\$1, 080, 000 (2) Denton, Tex. (being built) ______ 2,750,000 (3) State School, Butner, N.C. 6, 343, 000 8,000,000 (4) Selingsgrove, Pa_____

No one of the above facilities serves more than 1,200 patients.

As Miss Mary Switzer, Director, Office of Vocational Rehabilitation has stated: "For every dollar spent on vocational rehabilitation we can expect a return to society of \$10 in taxes." (12)

Appropriations for the Rehabilitation Act of 1959 are recommended as \$10 million for the first year; \$12,500,000 for the second; and \$15 million for

the third.

Why should the National Association for Retarded Children, Inc., discuss instutionalization costs in presenting testimony on a rehabilitation bill? Unfortunately, the group of retardates who would benefit most from the Rehabilitation Act of 1959 (the semidependents—see p. 1 of this report) are, in most cases under current vocational practices (Public Law 565) unable to receive any services whatsoever. Past experience with our adult retarded population clearly shows what occurs when no services are made available in the community. As a result these retardates are either kept at home, left to look out of a window as the world goes by with television (if available) as their major source of enjoyment (13) or else, they are institutionalized.

One of the key provisions of the Rehabilitation Act of 1959 is title IV—"Rehabilitation Evaluation Services," "The term 'rehabilitation evaluation services' means (1) diagnostic and related services (including transportation) incidental to the determination of the nature and extent of an individual's physical and mental impairment and rehabilitation potentials and the rehabilitation services required to realize these potentials, (2) the determination of appropriate referral of such individual for vocational rehabilitation services as defined in title I of this act, independent living services as defined in title II of this act, or other needed services provided by public or private agencies." (14)

Under the present laws, State rehabilitation agencies could conceivably provide this service to applicants for vocational rehabilitation, but have shown themselves reluctant to do so when the prognosis appears to be something

less than vocational rehabilitation.

Many people believe that the weakest element in present vocational rehabilition programs is that evaluation. The National Association for Retarded Children feels that the need for effective evaluation services would be intensified, if the States accepted responsibility for the rehabilitation of persons who would not be required to have vocational potential at the time of application. If this title becomes effective, it is believed that it will accomplish more than any other one thing could do to systemize and bring order into rehabilitation activities, assuring that no one is denied at least an adequate evaluation. It would furthermore, centralize in one place, under one agency, evaluation services for all adults.

Vocational Rehabilitation Services should be greatly improved, particularly for the severly retarded. It should no longer be required that the agency decide in the beginning whether the handicapped individual can be vocationally rehabilitated. This will result in the acceptance for services of many retardates who otherwise would have been rejected, without being given an opportunity

to actually demonstrate their potentials.

It is logical to assume that there will be a number of retardates who will be able to progress from an institutional or home setting to a life in the community. These retardates may even make a partial contribution and some will make a full contribution to their families, themselves, and to society through

either sheltered employment or full-time employment.

Whether we call the mentally retarded subnormal or deficient; whether their disability is mild, moderate, or severe; whether they are capable of being dependent, semidependent or semiindependent; extremely retarded, trainable, or educable, unless we provide for their needs, account for their individual differences and recognize that they like all of us, function on different levels at home and in our society at large; then we will further retard their development and deny them the opportunity to make contribution, not only to their families, to the total social effor but to themselves as individuals. And it is this right, once provided, that will again affirm what is essential and unique in our American way of life.

In speaking about the physically handicapped in the publication, "The Handicapped and Their Rehabilitation" Hoerner says: "Through a functional activities treatment program, it has been demonstrated that the individual's physical and mental reserve potential (his safety factor) capabilities can be brought forth and that eventual adjustment of total or partial physical and vocattional independence can be achieved. Functional training directed toward four major objectives have been grouped under the term "activities of daily living":

(1) Maximum use of the hands in all self-care.

(2) Ability to travel about.

(3) Adequate speech.

(4) Normal, near normal or good cosmetic appearance." (15)

This above quotation describes training objectives in rehabilitation which excludes the mentally retarded. Are the retarded without the need to learn how to use thier hands effectively, productively? Do they not need to travel about? Are they not able to use speech? Should they not be as normal looking as

possible?

The counterpart program for the mentally retarded which would provide for activities of daily living is called personal adjustment training. A working definition of personal adjustment training might well be "Personnel adjustment training is the process of providing social, emotional, personal, spiritual, and physical experiences for the mentally retarded as a necessary step toward their living independently in society."

The program physical demands of daily life as developed by the Institute for Crippled and Disabled in New York (16) could be adapted so that the needs of the mentally retarded were properly recognized. It could become an integral part of the personal adjustment training program with one major difference. Instead of providing instruction and training toward employment preparation, the initial emphasis would be instead on both home adjustment and com-

munity participation.

By providing for developmental experiences in the area of fundamental home skills (meal preparation, dishwashing, care of clothes, bedmaking, room care, local travel, and other self-care activities) a foundation is laid for family relationships, home responsibilities, and independent living.

Additional graded experiences and opportunities for everyday social activities, proper use of leisure time, avocational skill development, interpersonal relationships, and personal need fulfillment pave the way for good health habits, in-

dividual adjustment, and community participation.

In some instances, as a byproduct of these independent living rehabilitation activities those retardates able to progress and partake of sheltered workshop programs will be better prepared for such vocational training programs. Because of their participation and sharing in home responsibilities and community activities, they will be more wholesome well-rounded individuals. Their personality development will be reflected by the gains they make through successful personal, social, and interpersonal relationships.

In all instances, the severely retarded will be able to live a more fruitful, less dependent life thereby becoming less of a burden to themselves, their families, and society. Such an undertaking of this type is in keeping with our democratic

way of life and is in the public interest.

The Rehabilitation Act of 1959 will enable a considerable number of the mentally retarded to become rehabilitated. Too often the end of education for our severely retardates has resulted in a return to their homes or institutionaliza-Our hopes lie in this act which will provide so much help to those who need others so that they can help themselves.

Dr. Fraenkel. To begin with, my job with the national association is to travel around the country and help member units set up programs for the adults.

So my remarks will have to be only for the adults and rehabilita-

tion.

We feel that it is necessary to have steps to rehabilitation for those who need it and a preliminary step will be a comprehensive evaluation of the individuals, emotions, personal, medical, education, and

so forth, adjustment and current status.

From that point on we would be able through independent living on account for his need for self-care, dressing, undressing, toileting, feeding, taking care of his personal needs which would lead into presocial kinds of activities within the home which in turn would move into what we call activity centers which are actually prevocational and would enable these retarded who can move into this kind of program to achieve a social development.

From that point on, to move into prevocational to the vocational.

As we all know, the sheltered workshop offers vocational evaluation, adjustment training, and employment for those who have to remain in the workshop and for those who go into community employment, outside placement.

So there is this continuity of program.

We feel there would be on the whole much more done for their rehabilitation.

The next chart is mainly to indicate the relationship between a program and the individual's home independence and his community adjustment. If we take the three programs again and try to see the person functioning in the home and in the community we have a good idea as to where he should be in the program.

For example, somebody who is able to function 50 percent of the time independently at home and can participate 50 percent of the time in the community would not be expected to function properly in

the vocational rehabilitation and sheltered workshop.

If he is here he is misplaced. He should be in the activity center program or, better yet, in an independent living program where his needs can be met to the point where he can lift himself up above the bootstrap and move across the area of adjustment.

The same way for somebody who is able to function three-fourths of the time independently at home and function in the community,

he would not expect to be in an independent living center.

By the way, these charts are handmade so I apologize if they are not too clear.

The third, of course, brings up the problem of the home. That is what is going on in the New England region.

The top figure shows the latest statistics on population in the New England area. It is close to 10 million people.

Of that we projected 3 percent of that population as being mentally

retarded, which would be approximately 300,000.

Within the State of Maine there are to our knowledge one or two programs only for the adult in rehabilitation. This is beyond education.

In New Hampshire we have no record of any adult program for

the mentally retarded.

I am sure there are some, but we have no information on them. In the State of Vermont they have a Rutland rehabilitation center which is a halfway house and training agencies for those who move

out of the institution and back into the community.

They also have a sheltered workshop.

In Massachusetts there are programs in Salem, Williamstown,
Boston, and Springfield, according to our information.

The most recent has been a grant given to Boston to set up a

research project for the retarded in employment.

The same thing has happened in Rhode Island. They have recently acquired a research grant which would enable the program in Providence to take a group of retarded and try to find out where they can be properly placed in community employment.

In Connecticut there are programs in Stamford, Hartford, Green-

wich, Bridgeport, and Waterbury.

Our records show less than 25 programs.

We would say as a conservative estimate that there is a need to handle at least 15,000 retarded adults in these kinds of programs.

Twenty-five programs or less, as a modest figure, are unable to account for more than 2,000 at best. This gives you an idea as to need.

As far as what can be done, I believe the bill that is being discussed, 3465, would enable the majority of these programs to be increased and certainly we are very much in favor of title II, the independent living services, which would provide for those retarded, who are at this moment perhaps at home or some who are in institutions, to be able to live a more dignified life and perhaps move out of the institutional setting into the home and in some instances into the workshop and in some instances into employment.

This is very, very possible.

So we feel that this is a bill that would be the counterpart to the Barden-La Follette Act of 1953. This would enable the next group who are unable to move into employment to be properly taken care of.

It would eliminate the term "vocational rehabilitation." It would

make it rehabilitation.

Mr. Elliott. Thank you very much.

Mr. Fraenkel. Thank you, sir.

Mr. Elliott. Our next witness is Edmund S. McLaughlin, executive director, United Cerebral Palsy, Fairfield County, Conn.

Is Mr. McLaughlin here?

If Mr. McLaughlin is not here I will call our next witness, Dr. Ralph F. Garry, Boston University School of Education, Boston, Mass.

In his absence I will call D. Reinhardsen, Jr., first selectman, Town

of Guilford, Conn.

STATEMENT OF D. REINHARDSEN, JR., FIRST SELECTMAN, TOWN OF GUILFORD, CONN.

Mr. Reinhardsen. Mr. Chairman, gentlemen of the subcommittee, this afternoon I must attempt to wear four hats at the same time and to concur with your desire of getting to sunnier climates.

I will attempt to do this the best I can.

I have the pleasure and privilege of representing the Connecticut Association for Retarded Children as vice president of that association.

Further, to represent a local organization known as the Shoreline Association for Retarded Children as president of that organization.

Thirdly, as first selectman of the town of Guilford, a community of some 8,000, and fourthly, as parent of a mentally retarded boy, aged 7.

In deference to your desires, Mr. Chairman, I will paraphrase the statement that we have prepared for today's presentation and present

this for your consideration at the conclusion of my remarks.

I first would be remiss not to sincerely extend our thanks, the thanks of the parents of retarded children, the thanks of the Connecticut association, and the thanks of the children themselves for the efforts, considerations, and the work that your committee has so far so nobly done in your attempt to shed light on the problems that exist and to bring the handicapped children of our Nation closer to the goal of opportunity and the self-fulfillment for Americans regardless of their condition or their limitations.

We are also extremely grateful to our own Connecticut General Assembly who in this past session enacted what may well be the most comprehensive body of State legislation ever adopted in this field

within a single year.

Of course, the keystone of this legislation was the creation, as you probably are well aware, of a division of mental retardation within

the existing State department of health.

The various divisions of this bill are too numerous to mention in any detail. The establishment of sheltered workshops so desperately

needed are one phase.

A phase that I am particularly interested in, however, is our day care program. The day care programs have mushroomed throughout this State in the past 5 years. There is no question of their need or the fact that with more extensive day care facilities that fewer children, even those of the severely retarded category, may not have to be institutionalized.

A great deal of emotional pain could thus be spared the children themselves and their parents and the cost of institutional facilities

and services in our opinion could be reduced substantially.

Day care classes, though still in their infancy in Connecticut, and probably elsewhere throughout the Nation, have already demonstrated that they can do a great deal to bring the retardate out of his shell to overcome many emotional obstacles and to start the child on the road to good social adjustment.

The day care class certainly represents as much an educational process to the day care child as the trainable class to the trainable

child.

And does this not suggest, Mr. Chairman, that the educational role of Federal agencies under your committee's jurisdiction should be

broadened to include day-care programs provided that they, of course

incorporate training elements and are not merely custodial.

A great deal could be contributed in this area by Federal agencies. There is, for example, no such thing anywhere in the Nation to our knowledge of a formal training program for day-care instructors. There are no manuals on methods or on techniques.

Very few conferences or seminaries have been planned to be held. No body of philosophical theory covers this increasingly important

area.

Yet the number actually of potential day-care retardates no doubt exceeds the total number of children in certain other groups of the handicapped who are very fortunately already enjoying some of the betterments under Federal programs.

Today, December 18, there are 300 children born mentally retarded.

Tomorrow, December 19, 300 more will be born.

By the end of the year, 120,000 will be added to the rolls of the already 5 million that now exist in this country today.

We are not talking about isolated cases. It is one of our major

problems.

Another important legislative enactment of our Connecticut Legislature in this past year was the institution of mandatory education. Here, as first selectman of a growing community, I am well aware of the problem that this presents.

The stimulus of your legislation, sponsored by your committee, has been an important factor in swelling the ranks of teachers of the retarded which is going to become one of the most important problems

as this act becomes law in September 1961.

The Office of Education and other Federal agencies can make a very important contribution to the solution of teacher training, teacher recruitment, curriculum, and innumerable other problems, with which Connecticut and most of the other States are faced in meeting the need of the retarded.

And one particular education area which will take on an increasingly important role starting in 1961 will be that which includes the

groups between the ages of 16 and 21.

As you are well aware, the practice of most school systems throughout the country has been to drop retardates when they reach the age

of 16.

Connecticut's new law means that not only will these young people remain in school, but that new programs must be devised so that they, the schools, and the communities, will receive the maximum possible benefit from their lengthened school years.

Like many other States, Connecticut has major curriculum and program needs in the fields of this age group and we sincerely look to the Federal Government for leadership in stimulating new and better

approaches and techniques.

The problem of retardation, I believe, has come out of the closet. I would like to include in the statement I will turn over to you a copy of a local weekly paper of one of our community towns, the town of Guilford. To show you what small communities are thinking with respect to this problem, I would like to quote very briefly part of an editorial which I will submit in full:

There are some difficulties which can strike without regard to financial, intellectual, social or physical status of a family and for which science has as yet discovered no preventative procedure. They can produce an intolerable continuing load on a family in ordinary circumstances. This, in turn, can eventually lead to an increase in the public burden. There are countless degrees of retardation. In many instances proper education can make useful citizens out of youngsters who without special attention might never achieve an effective life. This kind of education is specialized, time consuming, and therefore, comparatively costly. Yet besides being of tremendous importance from the humanitarian point of view, it is generally justifiable economically because of the extent to which it reduces the cost which the individuals involved might ultimately impose upon the family and upon society.

Mr. Chairman and gentlemen of the committee, I sincerely appreciate your attention, your consideration of all that you have heard over the past few days. I sincerely trust that you will carry back to your full committee those comments with assurance that through your efforts we will realize the ultimate achievements that many of these children can achieve through these efforts.

Thank you very much.

Mr. Elliott. Mr. Giaimo has a question.

Mr. Giaimo. I just want to say thank you, Mr. Reinhardsen, for

coming. I am aware of the interest you have in this program.

Just recently I visited the town of Guilford. I noticed a project you have there, I believe you are interested in it, for the mentally retarded children.

What was the name of that?

Mr. Reinhardsen. You mean the Thrift Shop?

Mr. Giaimo. Yes.

Mr. Reinhardsen. This is one way of raising money.

Mr. Giaimo. Is that not the idea on a community basis, on a volun-

tary basis?

Mr. Reinhardsen. All the money raised to support our program—I am speaking now of the community of 8,000—is through voluntary contributions through community funds, through cake sales, rummage sales, and so on, and through this community thrift shop.

There has been no State money, no public money used to carry on the program that exists in our community and this is true throughout the State, and I am sure throughout the Nation.

Mr. Giaimo. Thank you very much for coming down.

Mr. Reinhardsen. Thank you, sir, again. Mr. Elliott. Thank you, Mr. Reinhardsen.

(The documents referred to follow:)

[Editorial from the Shore Line Times, Guilford, Conn.]

FOR HUMANITY AND ECONOMICS

There are some difficulties which can strike without regard to financial, intellectual, social or physical status of a family; and for which science has yet discovered no preventive procedure. They can produce an intolerable continuing load upon a family in ordinary circumstances. This in turn can eventually lead to an increase in the public burden.

Retardation is a problem of this nature. Guilford and its neighboring towns have assumed a position of leadership in meeting it. The Shoreline Association for Retarded Children has made tremendous progress during its comparatively short history, and is one of the most effective units in the State group

with which it is associated.

There are countless degrees of retardation. In many instances proper education can make useful citizens out of youngsters who without special attention might never achieve an effective life. This kind of education is specialized, time consuming, and, therefore, comparatively costly. Yet besides being of tremendous importance from the humanitarian point of view, it is generally justifiable economically because of the extent to which it reduces the cost which the individuals involved might ultimately impose upon the family and society.

The existence of a local, active, friendly organization and school for the exceptional child, moreover, makes it easier for the parents to recognize that the

difficulty exists and to take the necessary steps to meet it.

Any way one looks at it, SLARC is a community asset. It has found so much need for its services in this and neighboring towns that its budget has had to expand continuously to keep pace with the demands upon it. We urge the townspeople to grasp thte opportunities they have to help it—community fund, thrift shop, and projects sponsored by various service clubs.

STATEMENT BY D. REINHARDSEN, JR.

Mr. Chairman, gentlemen/of the subcommittee, in behalf of the Connecticut Association for Retarded Children, I extend heartfelt thanks to you—thanks for permitting our association to present its views to you, but more especially for the great impetus you have already given to the advancement of special education and rehabilitation for the retarded, and for your continuing efforts—as manifested in your current hearings—to bring the handicapped of our Nation closer to the goal of opportunity and self-fulfillment for all Americans, regardless of their condition or limitations.

Dr. Elizabeth Boggs, president, and Dr. Gunnar Dybwad, executive director of our National Association for Retarded Children, have already presented to you the broad views of the NARC in the special areas with which your committee is concerned. We of the Connecticut ARC wholeheartedly endorse these

statements.

I believe the time you have so generously allotted our State association can most profitably be used in, first, summarizing the content and aims of the legislative program adopted this year by the Connecticut Legislature at our request, and, second, pointing to certain implications which flow from this legislation.

The Connecticut General Assembly this year enacted what may well be the most comprehensive body of State legislation ever adopted in this field in a single year. The specific bills were the result of many years' experience and study by both the organized parents and friends of the retarded and professional

workers allied with them.

The keystone of this monumental legislative program was the creation of a division on mental retardation within the State department of health. The division is to be administered by a deputy commissioner of health, with the guidance of an advisory council on mental retardation, consisting of seven persons with backgrounds in this or related fields. The division has jurisdiction over all State-sponsored programs for the retarded except for education and rehabilitation, and will make allocations of funds in three areas where appropriations were made for the first time in 1959.

Education and rehabilitation remain in the domain of the State department of education, but as you can appreciate, a new State agency dedicated to the stimulation of new and expanded programs for the retarded of all ages and conditions, and armed with subsidies to encourage the development and growth of local programs, cannot help but have an important influence on education and rehabilitation as well as other aspects of the mental-retardation problem.

Moreover, in the rehabilitation field, while the State rehabilitation agency is limited to counseling, testing, dissemination of information and other supportive functions as well as administration of training funds on an individual basis, the new State program provides for grants of operating funds to workshops as such—including workshops both for retardates judged capable of rehabilitation under existing standards, and those judged incapable.

The State of Connecticut thus takes a broader view of which retarded persons warrant governmental assistance, both in their training and, if circumstances require, in their continuance in sheltered workshops. Implicit also in the new State legislation is the belief that many retardates who cannot qualify for the present Federal-State rehabilitation program can be helped.

There is a significant number who may never attain a State of independent living, or even marginal independence, and yet may become considerably less dependent on their families and communities as a result of workshop training even if that training is on a minimal level. This in itself would warrant operation of special workshops for this group. Even more important is the fact that fine lines between categories of the retarded cannot be drawn—that the retardate classified as custodial today might very well become a promising workshop participant or even a worker in private industry next year, given the proper training, guidance, encouragement, and, if indicated, emotional nourishment.

Prior to the passage of this State statute, only one full-fledged workshop for the retarded was in operation in Connecticut. Our State association is hopeful that the new legislation will stimulate establishment of such workshops in every

part of the State.

Another phase of Connecticut's 1959 legislation for the retarded provides for State guidance and financial assistance to community day-care programs for the retarded. The term "day care" has different meanings in different States; in Connecticut, it is applied to community classes or groups for retardates judged too young or too severely retarded to attend public-school programs for the trainable and educable. This again comprises a significant group of retardates.

Day-care programs have mushroomed throughout the State in the past 5 years. There is no question of their need, or of the fact that with more extensive day-care facilities, fewer children—even in the severely retarded category—would have to be institutionalized. A great deal of emotional pain could thus be spared retarded children and their parents, and the cost of

institutional facilities and services could be reduced substantially.

Unfortunately, the day-care retardate today is lost in a no-man's-land. cational authorities do not regard him as their responsibility, and there are no other public programs or facilities for him. Yet the difference between the trainable child in school and the school-age custodial child excluded from school may be only the difference of a few I.Q. points, or of inadequate training techniques, or of other factors that are by no means insurmountable.

Ever since its establishment in January 1956, with no State or Federal assistance, the Kennedy Center day-care program, the State's largest, has annually "graduated" a class of day-care children to public-school trainable classes. Some have even gone on to educable classes. Day-care classes, though still in their infancy in Connecticut and elsewhere in the Nation, have already demonstrated they can do a great deal to bring the retardate out of his shell, to overcome emotional obstacles, and to start the child on the road to good social adjustment.

The day-care class certainly represents as much of an educational process to the day-care child as the trainable class does to the trainable child. Does this not suggest that the educational role of Federal agencies under your committee's jurisdiction should be broadened to include day-care programs, provided that

they incorporate training elements and are not merely custodial?

A great deal could be contributed in this area by Federal agencies. for example, no such thing, anywhere in the Nation, to our knowledge, as a formal training program for day-care instructors. There are no manuals on methods and techniques; very few conferences and seminars; no body of educational or philosophical theory covering this increasingly important area. Yet the number of actual and potential day-care retardates no doubt exceeds the number of children in certain other groups of the handicapped who are, fortunately, already enjoying the benefits of Federal programs.

Another statute enacted by the 1959 Connecticut Legislature makes it

mandatory for local school systems to provide classes for both the trainable and

educable retarded.

Connecticut's experience with a permissive education law passed in 1953 has been similar to that of most of the States with such statutes. Six years after this law was passed, a majority of trainable children in the State either were not in classes or were attending on only a half-time basis. The chief argument against mandatory classes was that teachers were not available. This, of course, involved a vicious circle: As long as local school systems were not absolutely required to provide classes, many would make no special effort to obtain teachers.

The stimulus of legislation sponsored by your committee has been an important factor in swelling the ranks of teachers of the retarded, and will become progressively more important in the years ahead. Our States institutions of higher

learning have made outstanding strides in teacher training. No college or university in the Nation graduates more teachers of the retarded annually than Southern Connecticut State College in this very city. The University of Connecticut also has a well-developed special education program, and a program for teachers of the retarded was inaugurated this fall at Central Connecticut State

College.

With the advent of mandatory classes and substantially increased enrollments in September 1961, however, the teacher shortage will undoubtedly become even more severe. Our association has urged in the past that new methods of obtaining additional teachers be explored. One such means might be adaptation of a highly successful Connecticut program whereby graduates of liberal arts courses have qualified as teachers of regular classes by taking accelerated courses. In the mental-retardation area, it may well be that less academic preparation is required for teachers and that more emphasis should be placed on inservice programs. This and other possibilities are at least worthy of exploration.

The Office of Education and other Federal agencies can make a very important contribution to the solution of teacher training, teacher recruitment, curricular, and innumerable other problems with which Connecticut and most other States

are faced in meeting the needs of the retarded.

One particular educational area will take on special importance when the mandatory law takes effect next fall—the group between ages 16 and 21. As you are aware, the practice of most school systems has been to drop retardates when they reach 16. Connecticut's strengthened law means not only that these young people will remain in school, but that new programs must be devised so that they, the schools, and the community will receive the maximum possible benefit from their lengthened school years. Like many other States, Connecticut has major curricular and program needs in this age group. We look to the Federal Government for leadership in stimulating new and better approaches and techniques.

In closing, may I on behalf of our Connecticut association commend your committee on its decision to explore services for the retarded and unmet needs throughout the Nation, and for the time you are giving to this difficult and re-warding task. We are confident that as a result of your survey, great new horizons will be opened up, not only for the retarded but for all the handicapped of

our Nation.

Mr. Elliott. Is Dr. Ross R. Thomas here?

Is Mrs. Charles A. Donadeo here?

Mrs. Donadeo. Right here, sir.

Mr. Elliott. Mrs. Donadeo is the president and founder of the Bridgeport Chapter for the National Organization for Mentally Ill Children.

Mrs. Donadeo, you may proceed.

STATEMENT OF MRS. CHARLES A. DONADEO, PRESIDENT AND FOUNDER, BRIDGEPORT CHAPTER, NATIONAL ORGANIZATION FOR MENTALLY ILL CHILDREN, CONNECTICUT

Mrs. Donadeo, I am Mrs. Donadeo, president of the Greater Bridgeport Chapter for the Mentally Ill Children, Inc.

We have devoted our time to this organization and we are just a

group of volunteers that organized last March of 1959.

At this time we have about 15 children who are very much in need of help—mentally ill children. To operate this program it will take approximately \$20,000 a year, just for about 10 children. Of course, it would be very, very impossible to gain all this money from local funds and we have been, as the other man stated, giving card parties, food sales, rummage sales, to operate this program in Bridgeport. So we are appealing to you to help these forgotten children,

I think with proper care and treatment we could prevent them from Toda on the most sortegal to

being mentally ill adults.

Of course, I am not going to take a lot of time and I will make it brief, but I could leave this program; Or would the other people here like to hear our program?

Mr. Elliott. Yes, ma'am, you may proceed.

Mrs. Donadeo. I will read it through.

The Greater Bridgeport Chapter of the National Organization for Mentally Ill Children was organized in March of 1959 after several months of study and planning. Its purpose is to help fill one of the most pressing and desperate needs in the field of mental health services in Greater Bridgeport: to provide help for the many seriously disturbed and mentally ill children in the area, children previously dismissed with a diagnosis of schizophrenia or outism.

Before its establishment, these children had nothing available to them. They were too ill to be helped by the usual program of the child guidance clinic, were not eligible for service from other agencies serving children, and, in fact, had no source of help on a continued basis anywhere in the state. Most of them could not attend school or nursery school and are too disturbed to even play

with other children.

Realizing the tremendous need for help to these children and their families, the Greater Bridgeport chapter has set as its major goal the development of a

special program for these forgotten children.

In addition to participating in the program of the National Organization for Mentally Ill Children by disseminating information, supporting research, and developing special facilities throughout the country, the following program is now underway. This has been worked out with the collaboration and cooperation of the board of directors and the staff of the Child Guidance Clinic of Greater Bridgeport, Inc.

PROGRAM

The current program consists of four parts. These are under the supervision of the staff of the child guidance clinic, which provides all professional and clinical direction. It has been in operation since March of 1959.

1. Group therapy for parents.—Recognizing the despair and confusion of their parents, this part of the program is designed to help them specifically in their handling of these children by sharing experiences with others, as well as group discussion of any particular problems. It also serves to provide support and relief from the tensions created by these children in the home.

Each group is limited to five sets of parents so as to give every one an opportunity to participate freely in the discussion. Meetings are held every 2 weeks from 8 to 10 p.m. These groups are led by staff members of the child guidance

clinic

2. Evaluation of the children.—This is designed not so much to provide a diagnosis (since most of these children have had one or more adequate diagnostic studies) but rather to develop a complete picture of the child and the way in which he functions.

The child is also studied as a member of the family and an attempt is made to provide the parents with as full an understanding of the child and his prob-

lems as possible.

Following the study, the parents are given an opportunity to discuss the findings and recommendations at considerable length and in as much detail as necessary with the psychiatrist and psychiatric social worker who have participated in the study.

Another function of this evaluation is to determine whether or not the child

is capable of fitting into the third part of the program.

3. Day care program for the children.—This part of the program is planned to get underway in September and is designed to provide these youngsters with a positive group experience in a setting designed specifically for them under the leadership of a trained psychiatric group therapist who is experienced in working with disturbed children. It is planned to start this on a part-time basis, probably three 2-hour sessions a week, at first.

The group therapists will also work under the supervision of the medical director of the child guidance clinic. Each group will be limited to five or six

children so that individual attention can be provided.

It is hoped to eventually expand this day care program so that children can attend every day and also throughout the summer, but at this point of beginning it is necessary to limit it somewhat,

4. Individual treatment of children and parents.—As special problems arise, or as the staff sees a need developing, one or more individual sessions with the parents or children may be held. This part of the program will be quite flexible and determined solely by the individual needs of the individual case.

POLICY

This program is made possible by the cooperative efforts of the Bridgeport Chapter of the National Organization for Mentally Ill Children and the Child Guidance Clinic of Greater Bridgeport, Inc. By special arrangement between the boards of directors of these two organizations, the chapter has contracted to reimburse the clinic for the costs of this program. The clinic, in turn, is allocating time for this program beyond its regular hours in order to make this essential work possible.

Who is eligible? Any child, resident in the Greater Bridgeport area, whose

illness is such as to fall within the scope of this program,

How is this determined? Many children have already been studied and diagnosed since this type of mental illness usually makes its appearance within the first 3 years of life. Where there is question, the child may be referred to the clinic for preliminary screening. Any physician, parent, or agency may refer such a child.

How does the child get into the program? With the established diagnosis or following initial screening at the clinic, the parents are then referred to the Bridgeport chapter for inclusion in the program. After a brief conference with the parents at which time questions are answered and financial arrangements

made, the clinic is notified of the acceptance of the child.

Following this notification, the clinic begins the evaluation, and then plans

with the parents for participation in the other parts of the program.

It is important to mention that all medical and personal information about the child remains available only to the professional staff of the clinic which ad-

heres strictly to the rules of medical confidentiality.

How is the program supported? Each parent is expected to pay what they can to help defray the costs. Through its various fund raising activities, the Bridgeport Chapter of the National Organization for Mentally III Children, underwrites the program in its entirety, in so doing it must rely to a great extent on the interest and support of the parents, families, and friends of the children, as well as all those in the community who are able to help provide some hope for these forgotten children and their despairing parents.

Mr. Elliott. I want to thank you for your testimony, Mrs. Donadeo.

Mrs. Donadeo. You are welcome.

Mr. Elliott. Our next witness is Mrs. Bertram A. Weinert, executive director, Stamford Community Council, Connecticut.

STATEMENT OF MRS. BERTRAM A. WEINERT, EXECUTIVE DIRECTOR, STAMFORD COMMUNITY COUNCIL, CONNECTICUT

Mrs. Weinert. Thank you, sir.

I first want to thank you and the committee for the invitation on my behalf and also on behalf of the Stamford Community Council which is very much interested and involved in the rehabilitation field at the moment

From them I want to convey the congratulations to the committee

for their interest in this crucial matter.

Just very briefly I would like to look at a few statistics with you which we feel reveal the value of rehabilitative services to both the individual and country as a whole.

In 1956 there were 66,296 disabled persons who were returned to

employment, to full employment.

In 1957 this group increased to 71,570 persons.

In 1958 there were 80,739.

It is estimated that the 71,570 men and women who were rehabilitated during fiscal 1957 increased their annual earnings from \$18,900,000 to approximately \$137 million.

Mr. Elliott. Let me interrupt here to say to you, Mrs. Weinert, that it is estimated that the number for 1959 will be 90,000 for this

vear.

Mrs. Weinert. That is something we did not have. I am very

glad to hear it.

Actually, the committee and myself were very impressed, I mean our rehabilitation committee of Stamford and myself, were impressed with the fact that in 1 year of full employment of that group that was rehabilitated through 1957, in the year 1958 when they were fully employed their earnings rose from \$18,900,000 to \$137 million, \$137,600,000 and added approximately 900 million man-hours to the total Nation's productive effort.

Of that 71,570 persons, 53,000 were completely unemployed at the time they began rehabilitation and some 14,000 of that group had been completely dependent upon public assistance and were receiving financial aid from public agencies at the rate of \$11,400,000 a year.

For those 14,000 persons the total one-time cost of their rehabilita-

tion was \$11 million

Projecting some other figures that we are interested in in Stamford, because we are presently engaged in a chronic illness survey and this relates very intimately, as you know, to rehabilitation, just looking at that segment of the population in the over 65 group, the estimate is that by 1980, 23 million people will be 65 years or over and with the current rate of 57 percent of that age group in the present population having chronic illness or disabilities, it is estimated that by 1980 there will be 13 million relatively disabled older people.

This whole growing incidence of disability resulting from an everincreasing life span really more than offsets any gains that have been made in conquering acute diseases such as tuberculosis, and the lack of personnel continues to be the primary factor we feel preventing

more rapid extension of rehabilitative services.

Taking rehabilitation to mean restoration of total physical and emotional well-being there is a need to encourage programs to provide funds for training personnel in all fields and for research and for application in all fields, and by all fields we take it to mean medicine, psychiatry, psychology, social work, group work, occupational therapy, and vocational training.

Physicians in particular we feel are needed and Federal funds are

required to assure a supply of well-trained doctors.

The Public Health Service estimates that the physician population should be about 133 to 100,000 people in the population and their figures indicate that this will drop to 125 per 100,000 if the present rate of graduation continues as it is from medical schools.

We feel that grants-in-aid to medical students directly and matching grants for medical school construction are needed to offset this

probable change in the ratio.

Nurses are also needed to fill a critical shortage.

In New York City, for example, some figures were released where approximately 29 percent of the staff positions in the RN and PN categories were filled in the municipal hospitals.

Also, their salaries are amazingly low.

This feeling is that incentives in the form of scholarships and grants and supplementary income possibly should be provided to encourage

girls to enter the nursing fields.

In Stamford we are particularly interested in placing nurses in training for specific work in chronic and convalescent hospitals, nursing homes which require very special types of training, with emphasis on rehabilitation.

We also feel specialists are needed in all areas of the rehabilitation field, particularly speech and hearing therapists and social workers to provide the essential social services that these settings require.

Also needed are personnel trained for the care of emotionally disturbed and the mentally retarded—psychologists, psychiatrists, social

workers, and teachers.

Rehabilitative services which have proven to be so effective should

be extended to aid those presently not reached.

The apparent common practice of committing to State hospitals the nonpsychiatric seniles is a shameful, wasteful, and inhuman means of avoiding a pressing problem.

Once we understand better what senility is we can provide better

care for it.

There is need for research, pilot projects, and funds for the rehabilitation of the discharged, mentally disturbed patient who returns to his community.

There is a need for rehabilitative after-care programs and for community health care centers that bring psychiatric care nearer to the

home of the patient.

We feel a major problem in the field of sociomedical rehabilitation is the time lag between the discovery of new knowledge in the medical field and in the rehabilitative field and its application.

We know that very often knowledge lies in warehouses as a result of delayed publication and very frequently articles are published in

medical journals and seemingly never get to the practitioner.

It has been said that if we were to put to effective use all of our existing knowledge in chronic illness, rehabilitation, and mental retardation, we could do a 50-percent better job than we are now doing.

Preventative medicine is a case in point. In Stamford there has been a lot of talk of habilitation rather than rehabilitation and this

should be our concern.

Scientific knowledge should be applied and applied to prevent illness and disability.

Early case finding is a major component of prevention.

It is felt this is a major weakness in the rehabilitation field. Method of case findings through parent education, professional education, and continuous health supervision should be encouraged by Federal legislation.

Rather than maintain people in idleness and futility there should be programs to seek out causes of disability and dependence, programs to prevent age disease, programs to begin the rehabilitation at point of

diagnosis

There is a need to emphasize the application of medical research for practical rehabilitation programs.

Another major problem, and this is what the committee in Stamford is particularly interested in, is the area of coordination of services and communications among them. There is a need for constant contact between agencies and between members of the helping professions.

There is need for broadly representative community planning and for central referral processes and for interchange of personnel.

Planning and coordination also requires training personnel.

Here, too, is a lack which can be eliminated by Federal grant and

scholarships.

As important as the skilled professional working toward better services, even more significant is the need for community commitment, the local State and National community to the principles of

complete high standard service of individuals and families.

Government can be of help through public policy statements along with specific legislation in encouraging citizen participation. Just as urban renewal requires citizen involvement in a workable program for redevelopment, so should public health planning require similar conditions.

Public health activities should be planned on a regional basis because of the increasing complexity of public problems in areas around metropolitan centers. Population shifts to suburban areas point to

the need for a flexible program in public health.

In mentioning the suburbs, there is one point regarding education that should be touched upon since it appears to be considered a problem in urban centers only. Vocational guidance in elementary and secondary suburban schools is inadequate.

There is a need to improve local testing programs, local counseling

and guidance services, and again, add personnel to that field.

Matching grants to States would be a valuable aid in this area. Also, serious attention should be paid to the alarming increase in the

high school dropout rate.

Thought should be given to reconsidering the minimum age for compulsory school attendance. Many youngsters below 16 would benefit from counseling which would lead them, after a change in the law, to useful employment.

Returning to the field of rehabilitation, there is a need to aid chronically ill patients who are receiving care in facilities for acute patients. Many persons suffering from long-term illnesses are maintained in general hospitals merely because there is no place to go.

Federal encouragement for pilot projects and grants should be pro-

vided to establish homestead programs.

In the few instances where such programs have been set up, converted wings of hospitals have been used, and facilities utilized which were no longer needed for acute patients.

Goldwater Memorial, Elmhurst General, and Bird S. Coler Hos-

pitals now have these programs.

The homestead separates the chronically disabled from the chronically ill. The former have permanent, often static disabilities and require infrequent medical and hospital services, as contrasted with the latter who require continuing medical care.

The homestead is a colorful, homelike setting which provides affection, Security, social contacts, self-expression, through creative activities, and has at hand the services of the hospital, if ever needed.

Comparative cost figures present a telling argument for such programs, when \$25 per diem is average cost of care in acute general hospitals, and \$8.50 is the per diem in a homestead.

Homestead programs should be established as one part of a gamut of facilities and services, including home care, general hospital, chronic disease hospital, nursing homes, after-care clinics, homemaker

services, available to the chronically disabled.

In order to utilize this range of services, there is a need for the development of effective evaluation procedures. Funds for comprehensive evaluation processes should be made available to the Office of Vegetieral Polyhilittiin for compute to lead processes.

Vocational Rehabilitation for grants to local programs.

But in suggesting this, it should be emphasized that the comprehensive evaluation toward comprehensive rehabilitation is the goal. Beyond medical and vocational aims, there are the concerns of the goal; psychological, educational, and the improvement of daily living status.

It may not be out of order to suggest that the vocational, in the title of Federal and State bureaus, should be dropped and their orientation be more directed toward total rehabilitation under team

supervision.

The bill, H.R. 3465, appears to be an excellent means of filling a gap in rehabilitation legislation. Assistance to States is needed for providing handicapped citizens greatly improved programs for the evaluation of rehabilitation potential, rehabilitation services for severely handicapped persons who can profit substantially from such services, but may not achieve vocational rehabilitation, and facilities for providing such services.

Title II, the independent living rehabilitation services portion of the bill, also would provide a program where none exists and the need

is great.

Severely handicapped people can achieve remarkable results with the right kind of program. This has been demonstrated under existing services, the rehabilitation center is Stratford being a fine example of work with such cases.

Under title II many institutionalized and homebound disabled could reach a level of functioning which would free them for independent

and fuller lives.

A particular benefit from both title II and title IV, the evaluation services section, would be that an agency no longer is required to decide in the beginning whether the handicapped individual can be vocationally rehabilitated.

This will result in the acceptance for services of many individuals

who otherwise would have been rejected.

The gain to individual, family, and community is difficult to measure. But we can be assured that the investment in rehabilitative programs and grants for personnel training will strengthen our Nation.

It seems unbelievable that we explode millions of dollars worth of missiles in an attempt to find protection through weapons, while we neglect a far more basic and important protective need—the health and welfare of our greatest asset, the people.

Mr. Elliott. Thank you very much.

Is Mr. N. Searle Light here?

Mr. Light. I would like to introduce myself further, Mr. Chairman.

Mr. Elliott. Mr. Light, our time limitation is 10 minutes.

You may proceed, sir.

STATEMENT OF N. SEARLE LIGHT, RETIRED, FROM CONNECTICUT STATE DEPARTMENT OF EDUCATION

Mr. Light. I am going to confine myself pretty much to the statement on behalf of the gifted children who seem to be lost in the shuffle.

I listened to two telecasts, two broadcasts on the radio, and three newspapers, and no mention of the gifted children appeared in any one of them.

I think that suggests the nature of the problem we face in trying to provide something for these gifted children in our community and

schools.

The crippled child attracts sympathy and the community does

things for him.

I had charge of that work for those agencies, with those mentally and physically retarded for over 25 years in the State department of education. I am very deeply interested in them.

I have lived through the time when we had to fight to get children

into those classes because of the opposition of parents.

The day has come now when the shoe is on the other foot and those classes are growing rapidly. Pretty soon it won't be long before 100 percent of the children will be cared for.

But nothing has happened as far as the gifted is concerned.

I did not know but I might stir up provocation this afternoon by saying that the gifted are handicapped too, but in a totally different way.

Incidentally, I think that in the management of administration, services to these people, the gifted do not belong in that special education section. They should be treated separately.

The people who are interested in the problems of the gifted are not interested in the problems of the other type of children and the

reverse is true also. They just are not the same.

For the moment here I do not want to be misunderstood. In the first place, they are handicapped because of the teachers whom they meet in the school. These children are exceedingly gifted; they are very able, intellectually able.

They read widely and very often at times they are more accomplished than the teachers are and they are more able than their teachers

are.

So we have a situation frequently when several of them have felt totally inadequate in the presence of those children in the room.

Not only that, but they were afraid of them. That has led a good many teachers to avoid servicing those classes with superior children. We need teachers. We need well-trained teachers.

We need teachers of superior ability to deal with those children. Those children are the biggest potential the country has so far as the future of America is concerned. It is time we began to do something for them.

The environment in which they work in the school frequently is not interesting to them at all. They are adults in a good many ways in

their reading and in their ability and the environment in which they have to work with children sometimes not of very high intelligence, is anything but stimulating to them. It is depressing. Sometimes it leads to a sense of frustration, hopelessness; they form bad work habits and frequently they drop out of school.

Much of what we think they need is adult material.

The secondary schools do not have too much of that material. They are shy the equipment material all the way through.

What they need is more of it, and of much more mature character

than most of the schools maintain at the present time.

The fourth handicap under which they work is the reluctance of adults in the family and in the school to admit the existence of a dominant interest in these children at a comparatively early age. Statistics conflict telling us just how early these people finally make their choices, but they do develop these strong interests and the policy in some cases has been to discourage those, to get the children to postpone the decision until some time later.

One lady in our group was postponing that decision until after completion of the liberal arts program. A lot of these gifted children are not going to the liberal arts college. Those people are going to be painters, they are going to be sculpturers, your poets, your authors of note; people of that kind, as well as leaders in community work.

Those children are frustrated, leave school, we lose them at the end of the high school program. They are disappointed and depressed

sometimes.

So I urge you to give serious consideration to what can be done for those children. We need better teachers.

We don't know enough how to handle these children. We need .

research.

The question of whether you are going to organize special classes for these children or special schools, who knows?

In this State there is not a community big enough to organize a special school for gifted children with all the facilities that that requires.

Should we build a regional school or what should we do?

It does not happen to be my problem. I am out of that picture now, but it does illustrate some of the need we face and which could be helped if provision could be made for a Federal aid and similar to what is done for other groups in the National Defense Act.

There some of the provisions of that bill are going to help gifted

children, but no as a group.

The improvements in the teaching of science and improvements in teaching other subjects will undoubtedly react to their very definite advantage.

There are a lot of other areas in which they are not influenced at all. So I would pray that your committee will find it possible to make some provision for the gifted children in your program.

Thank you very much.

Mr. Elliott. Thank you very much. You have made a very fine point, Mr. Light.

Is Mr. Edmund S. McLaughlin here?

Is Dr. Ralph J. Garry here? Is Dr. Ross R. Thomas here?

Dr. Thomas, Yes.

Mr. Elliott. Dr. Thomas is psychologist at the Newington Hospital for Crippled Children at Newington, Conn.

Dr. Thomas, you may proceed subject to our time limitation.

STATEMENT OF ROSS R. THOMAS, PH. D., PSYCHOLOGIST, NEWING-TON HOSPITAL FOR CRIPPLED CHILDREN, NEWINGTON, CONN.

Dr. Thomas. I would like to put these on some surface where they may be seen.

I will attempt to abbreviate my remarks.

I wish to particularly draw attention to this first chart on the cerebrally handicapped child in order to illustrate a point as regards

what we call the multiple-handicapped child.

Too frequently legislation is concerned with only one part of this group and yet the cerebrally handicapped are very frequently straddling different groups. So the child who has cerebral palsy, who has the obvious neuromuscular disability, may also have mental retardation of varying degrees.

There may be epilepsy, there may be brain damage, behavior problems, and then entering into any one in combination may be speech,

hearing, vision, and partial intellectual deficit.

We have in our experience, both present, the viewpoint of hospital school at Newington and also from the viewpoint of the medical staff, frequently encountered circumstances where over specific legislation dealing only with physically handicapped or mentally retarded has led to unfortunate results.

In the State of Connecticut there are classes and legislation which deal with those two groups particularly. Frequently, the parent prefers the child to go to a class for physically handicapped, whereas the

child may have fairly severe mental retardation as well.

The upshot is that both groups, if there is any subdivision here, suffer, and those children who are physically handicapped, but who are or normal mentality, do not get as enriched a program in schools as they would if there was some discretion left to the State and local school board in terms of certain legislation, so that this kind of phenomenon condition would not arise.

That is my first main point, that there is a danger to overspecificity

legislation which we wish to draw to your attention.

The second major point relative to this group is that research needs are overwhelming. We at Newington with the knowledge and moral support of the State board of education, are attempting to initiate an experimental demonstration class for children who show potential for near average achievement but who have some of the partial intellectual deficits of which I speak here.

This group we know exists. We do not know how many. We run across then in terms of children who are listed as cerebral palsy. We run across them with children who are thought to be generally men-

tally retarded

We run across them where the major outstanding symptom seems to be the behavior deviation, but frequently this partial intellectual deficit is not detected until there is a very thoroughgoing evaluation, including a thoroughgoing psychological workout. Unfortunately, we do not know the frequency. We do not know how many children are failing in classwork who could be assisted by a compensatory educational opportunity. I think we in Newington are particularly interested in this group of children who have varying partial handicaps intellectually.

You may have heard of the child who is aphasic, who cannot understand what he hears though his hearing is satisfactory, or the child who can hear and understand what he hears, but cannot organize a

verbal response as one illustration.

Another illustration which we frequently meet with are children who have quite adequate speech but who cannot perceive visually the difference between forms such as is necessary for the learning of reading and writing. This latter group we refer to as visually perceptually involved children and we are particularly hoping to embark on a program for these children.

At present such classes, do exist, but they are largely private, they are largely within the boundaries of major cities; and we think our class, if we manage to organize it, will be the first in Connecticut, and we hope we can eventually bring about a training program for teach-

ers in our setting.

Now, I do think that the State board of education, given some latitude for the use of funds, given some source of funds for research and for the establishment of such classes, would probably have done so. I hope that something from the Federal level might assist, par-

ticularly in research, in these kinds of areas.

I think that the present sources of Federal grants too frequently are not available directly to the State boards of education wherein the most knowledge does exist as to needs within the State. We believe that financial subsidization for such research and experimentation should be made available to State boards of education.

Another major point illustrated by this group is the importance of interdisciplinary approach. We in Newington believe we can develop a cooperative program including the services of members from our educational, medical, social services, psychological staff. This is

the total program for the cerebrally handicapped.

You will note perceptual handicaps in the third column.

We have actually seven different groups represented and then servicing all areas, but particularly perceptually handicapped, will be consultation with other specialists as well as therapeutic education, the demonstration class we hope to have, and parent counseling opportunities which would involve social services and psychiatry-psychology.

Now, what we feel here is that an interdisciplinary approach is important both in the research and in terms of the experimental educational program, since it is rather hard to carry out research or experimentation in education where the principal central fact is some medical condition such as brain injury without having avail-

able the medical specialist involved.

We feel that the research then, adding a sort of codicil to my last point, that some Federal fund specifically earmarked for interdisciplinary research, involving the medical fields and probably to be carried out in clinical centers where education is also carried out, would be a worthwhile program.

Finally, beside meeting research needs and emphasizing greater flexibility of legislation relating to special education, we believe assistance for teacher training for children represented by our chart is

important.

The close relationship to medicine suggests that the teacher might best learn in a medical center where clinical data and medical information may be coordinated with the educational program. Scholarship assistance from the Federal Government for such training programs would be desirable.

Similarly, such scholarships are desirable for training teachers of almost any group, but the multiply handicapped is the one that we feel is particularly important in this regard.

Turning from this general group we would like to suggest provision for more vocationally oriented high school programs for retarded children. We not that these children often become increasingly despondent or hostile toward a program still largely focused on academic areas.

School "sheltered workshops" would, in our opinion, be more beneficial and provide for a natural transition into prevocational training in industry or additional training in vocational rehabilitation

public education system.

Thank you for this opportunity to express our views.

Mr. Elliott. Dr. Thomas' formal statement will be made a part of the record at this point.

(The statement referred to follows:)

STATEMENT BY ROSS R. THOMAS, PH. D., STAFF CLINICAL PSYCHOLOGIST, NEWINGTON HOSPITAL FOR CRIPPLED CHILDREN, NEWINGTON, CONN.

Newington Hospital for Crippled Children is a private, nonprofit hospital serving residents of the State and financed largely by public subscription. We have a hospital school for inpatients. From experiences, both of the medical and educational staffs, we annually observe the effects of shortcomings in the

I would like to present one group of children-those with cerebral handicaps—as a group which illustrate several deficiencies in special education in our State. This chart displays the interrelatedness of a number of disordersvarious combinations of which may be present in any one child. The central medical fact is neurological impairment—sometimes referred to as brain damage. The manifestations may be in neuromuscular difficulty (as in the obviously cerebral palsied), in epileptic symptoms, in behavioral disorders, in speech or sensory disorders, or in handicapping disturbances of intellect which ranges from severe mental retardation to limited dysfunctions which have the effect of preventing, or hindering educational gains.

General point 1 illustrated by this group: legislation to date is overspecific. Many of these children are mutiply handicapped—retarded and physically handicapped—so does the child go to a class for retarded, or, as the parent usually desires, to a class for physically handicapped, which has the added benefit of provision for transportation. The net result is a disservice to all the the children involved. It appears to us that overly specific legislation may tie the hands of the State and local boards of education. Such effects should be anticipated and, as far as possible, avoided-possibly by legislation which leaves

more to the discretion of relevant boards.

Point 2: Research needs are overwhelming. We at Newington, with the knowledge and moral support of consultants from the State board of education, are trying to initiate an experimental-demonstration class for children who show potential for near average achievement but who have perceptual deficits which may exist as the main symptom or may be associated with neuromuscular and/or epileptic symptoms. We know these children exist-we know of scattered (and mainly private) classes for them in other States-and we know the State board

of education is concerned about these children. But—research is needed to determine the incidence of such disorders—conceivably a large proportion of children currently in retarded or opportunity classes as well as many children failing in the usual class setting have such disorders, which we have reason to believe can be greatly compensated for by proper culcational experience. Research is also needed to further develop these special techniques of education.

Let me digress briefly to enlarge on the limited intellectual effects common to many cerebrally handicapped children. These have elsewhere been termed symptoms of "brain injury" or "brain-damage"—symptoms which are manifested by discrepancies between different functions. Here are some examples; one group of conditions, termed aphasias, are shown in a person's inability to understand words although his hearing is unimpaired—or inability to produce speech although the speech apparatus is intact. Such children may—by means of signals or manual manipulation of materials, show that they are of normal intelligence in other regards. In the aphasic, therefore, there is inability to attach meaning to words and/or to organize a verbal response. This is a condition which often leads to improper placement in classes for the retarded.

A somewhat similar indication of partial deficit is shown in a child's inability to discriminate forms, or to produce forms by drawing. Frequently, we find these children can speak as well as their age group average—and even spell words verbally—but they may at the age of 11, 12, or older still be unable to read or write. We term this group perceptually handlcapped in the visual sphere.

Many other variations occur—all indicating some potential for much better general functioning if the specific area of difficulty may be overcome or compensated for.

I recently saw such a child whose verbal IQ is very superior (130) but who is near dull normal in visualizing in his "mind's eye" the forms of letters and words he wishes to place on paper. Therefore, his achievement at school is only average. He is fortunate to be so intelligent in other regards that he can compensate for his poor area. The next child, in contrast, may be near average verbally but he has been unable to compensate—he doesn't read and may never do so

Education and research in the instance of these children is either nonexistent or largely in the hands of private organizations. Sources of research grants at the national level too frequently are not available directly to State boards of education—where the most knowledge exists of needs for research and experimentation. We believe financial subsidization for such research and experimentation should be made available to State boards of education.

My third major point, as illustrated by this group—is the importance of interdisciplinary approaches. We at Newington believe we can develop a cooperative program including the services of members from our educational, medical, social service and psychological staffs. Seldom is this possible when research funds are allotted to individuals or organizations devoted to a single viewpoint. We would, therefore, attach a codicil to our last recommendation—namely, that research funds for special education should include funds specifically earmarked for interdisciplinary, cooperative research, preferably at clinical centers where medical and educational programs exist. As you will note from our chart, seven specialities are to be involved in our projected program for perceptually handicapped...

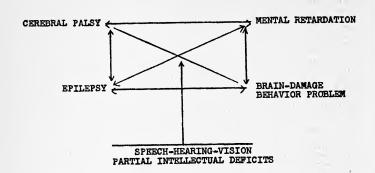

Finally, besides meeting research needs and emphasizing greater flexibility of legislation relating to special education, we believe assistance for teacher training for children represented by our chart is important. The close relationship to medicine suggests that teachers might best learn where they have ready access to clinical data and medical information—again interdisciplinary programs. Scholarship assistance from the Federal Government for such training programs would be desirable. Similarly, such scholarships are desirable for teaching trackers of multiple handicapped.

training teachers of multiply handicapped.

Turning from this general group we would like to suggest provision for more vocationally oriented high school programs for retarded children. We note that these children often become increasingly despondent or hostile toward a program still largely focused on academic areas. School sheltered workshops would, in our opinion, be more beneficial and provide for a natural transition into prevocational training in industry or additional training in vocational rehabilitation programs.

Thank you for this opportunity to express our views.

CEREBRALLY HANDICAPPED

Adapted from Hughes, James G., Second Tenn. Conf. on Handicapped Children, 1958.

WEST HARTFORD, CONN., December 11, 1959.

Ross Thomas, Ph. D. Newington Hospital for Crippled Children, Newington, Conn.

In the practice of pediatrics in greater Hartford, it is evident that there are many unmet and unrecognized needs in the field of the cerebrally handicapped child. The greatest need is in the brain-damaged child with behavior problems and learning difficulties, requiring special attention and understanding. This includes those children with mixed-motor and mental handicaps. The children with motor handicaps are easily recognized and, therefore, have received the most help to date. Children with problems in communication; namely, speech and hearing deficits of any etiology, can be overlooked even in a community such as ours.

It should be our aim to find out the incidence of these and similar problems in an average community. The second need is for teachers with specialized training. They, in turn, should be able to set up a class for a limited number of children for the benefit of those children and as a teachers educational program.

The third need is for medical education and the dissemination of medical and educational information to professional personnel, especially physicians who deal with children, so they may be of value in diagnosis and treatment.

In the preschoolchild and in children who are now in school, I am sure we could find an unexpectedly large number with intellectual defects and I believe that all efforts should be made to determine the magnitude of this problem and set up facilities for their management.

I hope this information will be of help and lead to increased interest and

support in the coming years.

FREDERICK J. FLYNN, M.D.

Mr. Elliott. The next witness is Mr. Frank Looney, director of welfare, New Haven, Conn.

Mr. Looney, we are pleased to have you.

Because of our time limitation we have had to limit our witnesses to 10 minutes.

STATEMENT OF FRANCIS W. LOONEY, DIRECTOR OF WELFARE, NEW HAVEN, CONN.

Mr. Looner. As the director of New Haven's welfare department, I welcome the opportunity of appearing before this subcommittee which is evaluating the need for the extension of rehabilitation services.

From the framework of the public welfare agency—and I think we are particularly responsive to the ebbs and flows of our economy—we see the need from the point of view of the productivity of our clients

Increasingly, we observe a continuing rise in the numbers of people on our relief rolls who are employable, but for whom no employment can be found.

In an expanding labor market many of these persons are absorbed,

but in a depressed market there is no room for them.

For these people are, by and large, the marginal workers and their importance to the job market depends upon how much their marginal efforts are needed. For them, there is no job stability, no long-range planning. They drift in and out of jobs, never quite getting enough skill to make their next move a better one for them and their families. They are the last to be hired and the first to be fired.

These are the people unskilled in the use of machines and blueprints; they are the poorly educated, whose life has been of hard work from an early age on farms, or other forms of manual labor; they are the mentally deficient and mentally ill, and also the persons with physical deformities or limitations, whose handicap has prevented them from being absorbed into the job market.

In a sample of our caseload we found that approximately 60 percent of our relief clients had some form of emotional, mental, or physical

handicap.

The depressing feature about this group is that, lacking any plan-

ning and help with its problems, it tends to feed upon itself.

In our department, for example, the so-called employable rose from 25 percent of the total caseload in 1954 to almost 40 percent in 1959.

With hope for job improvement waning, turned away for lack of skill, the simple passage of time itself tends to make society, including their neighbors, friends, and even their children, put these people aside as unable to take a responsible role in a competitive world. This group forms the hard core of dependency on the relief roles in our city.

Because of our great concern with this problem, we have attempted to do something about it within the structure of public welfare, but with only modest success because of the need for a coordinated, in-

tensive approach by many disciples.

We have, for example, set up our own employment unit, hoping that we could direct some of the least wanted employees on releast wanted employees on releast wanted employees.

the job market.

We have also given a battery of tests to a selected group of 1958 employable men and women and we were disheartened at the very small number who showed any real potential for ready employment.

For even those who scored fairly well it was clearly indicated that job placement without rehabilitation and retraining would be difficult.

Both of these pilot studies have demonstrated the inadequacy of piecemeal attempts to resolve the inertia which grips large numbers of our clients. We know that unless concerted and sustained services are provided to get at roots, then simple treatment of branches will be of no avail.

The need for increased rehabilitative services is urgently evident in our urban society. Our welfare burdens and our community problems will mount unless we find the way to halt the trend toward apathy, the loss of motivation, and the lack of interest in the community

and its institutions.

The manpower loss to the area of this group is truly enormous when reviewed from their unproductive lives. But it borders on the catastrophic when we think in terms of the human values that have been allowed to deteriorate just because a man has lost faith in himself and because his family can no longer entertain any hope that he will live to the capacity and potential with which he started life on this earth.

For some of this group the pattern is so firmly established, the ego structure so deteriorated from repeated rejection in the labor market that prolonged efforts at rehabilitation may be uneconomical, but the least among them is entitled to a thorough screening, testing, and evaluation before a decision is made to discard them as non-productive members of society.

Many of these may be salvaged in part through a sheltered workshop which utilizes a limited amount of productive effort of which they

are capable.

Of greater concern is the younger, less-damaged group who could be redirected economically through retraining and rehabilitation to a significant level of self-sufficiency and independence.

It is true that we have in New Haven some excellent facilities and agencies engaged in rehabilitation activities and our welfare

clientele have benefited from the use of these services.

However, there is an acknowledged need for continued growth and expansion of these services to reach into areas and help people who cannot now be accommodated within existing limitations of staff and facilities.

The value of these services is evident in the statistics of our New Haven Area Rehabilitation Center. Of 376 adults treated and discharged 37 percent achieved full-time or part-time employment or housewife status. Almost another third went back to school or college or achieved an improved status. The final third were classified as not improved.

Mayor Lee in his opening address yesterday made particular reference to H.R. 3465, which, if enacted, would provide funds for aiding the development of new and enlarged rehabilitation facilities

for our community.

As city welfare director, for the reasons cited above, I also heartily endorse legislation of this kind.

It has been well stated by an ancient philosopher that:

The noblest charity is to prevent a man from accepting charity; the best alms one to show and to enable a man to dispense with alms.

Thank you, gentlemen.

Mr. Elliott. Do you have a copy of your statement?

Mr. Looney. Yes.

Mr. Elliott. I would like to have it. I want to capture that last quote you gave.

Mr. LOONEY. Do you have any questions?

Mr. Elliott. No, thank you. We thank you for your testimony.

Mr. Looney. Yes, sir.

Mr. Elliotr. Our next witness is Dr. Edith S. Lisansky, secretary-treasurer, Connecticut State Psychological Society.

Is Dr. Lisansky here? Dr. Lisansky. Yes, sir.

Mr. Elliott. You may proceed.

STATEMENT OF EDITH S. LISANSKY, SECRETARY-TREASURER, CONNECTICUT STATE PSYCHOLOGICAL SOCIETY

Dr. Lisansky. You have heard a good deal these two days about the very real problems of educating the handicapped and helping them to become useful members of society standing on their own feet.

The bill, H.R. 3465, has as its goal not only the teaching of a trade or the fitting of a prosthetic device, but the more ambitious and very

admirable goal of rehabilitating for independent living.

What the bill offers, in effect, is a basic American principle: It is better to stand independently on your own feet than to live out your life in an institution, dependent on others.

In institutional living—no matter how good the institution—some individuality and the right to make one's own decisions has to be

surrendered.

I would like, speaking as a psychologist, to direct your attention to a question which concerns my profession. The bill, H.R. 3465, states under definitions, on page 12:

The term "independent living rehabilitation services" means counseling, psychological and related services.

However, the services—listed on page 16—which rehabilitation facilities are supposed to offer are not all clearly defined. What, for example, is "(v) adjustment training"?

Adjustment to what? Does such adjustment training include coun-

seling and psychotherapy?

I am not talking here about friendly advice giving. We have all, at one time or another in our lives, turned to a parent or a friend or a colleague for advice. Counseling and psychotherapy is not this kind of friendly chat, nor is the admonition by one person to another that he stop worrying.

Psychotherapy is, rather, a highly skilled technique of treating emotionally upset people and it requires training and experience. It is a safe assumption that most of those whom the bill would seek to benefit would profit immeasurably from such psychotherapy.

The mentally ill: It is apparent that such treatment is indispen-

sable in the rehabilitation of the mentally ill.

During 1950, about one and a quarter million people were in public and private mental hospitals. It's a safe prediction that the numbers

will be even larger in 1960.

It is estimated that there are between 3 and 4 million alcholics in the United States. If one adds to this roll the mentally ill criminals, the drug addicts, and all the emotionally disturbed people who are not hospitalized, but who seek help through clinics and private practitioners, it adds up to one of the most challenging health problems of our time.

The handicapped: In addition to the mentally ill, there are those physically handicapped persons who carry along with their other dis-

abilities the emotional consequences of their handicap.

To be crippled or blind imposes burdens of mental pain, and it is a rare handicapped person who escapes painful, scarring emotional experiences. These people need help in using prosthetic devices and in special education, but they need as much to be helped in adjusting to society in such a way that they can lead satisfying, productive lives.

What it comes down to is that we psychologists cannot conceive of a total push on the problems of rehabilitation which does not make

available in all instances counseling and psychotherapy,

If this is what adjustment training means, good, but it needs spell-

ing out.

Our recommendation is that every treatment center, every curative workshop, every rehabilitation unit, include on their staffs at least one professional individual trained to do psychotherapy; psychologist, psychiatrist, psychiatric social worker.

Mr. Elliott. How do you define psychotherapy?

Dr. Lisansky. It is a highly involved technique which is a verbal interchange between two people in which the psychotherapist attempts to help the other person face up to the problems which disturb him, to face up to the issues which disturb him, and to handle them in such a way so that he can function better by working through the thing in the interchange between therapists and patient.

There are 375 psychologists in the State of Connecticut who are members of the American Psychological Association. Most of these psychologists have a doctor of philosophy degree which represents

a minimum of 3 years training after college graduation.

Most of the 375 are clinical psychologists. And clinical psychologists are being trained, not only to administer and interpret mental

tests, but in the skills of counseling and psychotherapy.

The trainee is supervised in this work until he acquired the knowhow and the experience to work on his own. Here, among these psychologists, is one untapped source of personnel to help cope with the overwhelming psychological treatment needs of the handicapped and the mentally ill.

Mr. Elliott. Are we not very short of psychotherapists, psychol-

ogists?

Dr. Lisansky. We are fantastically short of them.

It seems to me as though the need mounts at a rate. Even if we train at the rate we are doing it will not keep up with the need.

Mr. Elliott. The need mounts faster than the proportion that

would derive from the passing of time?

Dr. Lisansky. There is a question whether mental illness is on the increase in the United States. The impression of most of us who work in this field is that although there are no clear-cut statistics on this, it seems as though it is, it is mounting at a faster rate than

the population is mounting.

This may be because we are recognizing it more readily than we did before, or cause of greater stress or maybe in society where people do not have to struggle to look for a living and don't have to struggle and worry about three meals a day and shelter that somehow people become more anxious about things they cannot afford to be anxious about when they are struggling.

Whatever is the basis it does seem as though the need is mounting

much more rapidly.

Mr. Elliott. All of that illustrates the fact that in this field we are yet babes in the woods. We really do not know and we need research and we need fellowships.

Dr. Lisansky. Exactly.

I had thought about making some point today about research need,

but I was sure this would be raised by a number of people.

There is no question that we know much more about it than we did 50 years ago, but we don't know enough. It is admittedly trial and error, but we work with the best we have.

Mr. Elliott. The fellow who built America by felling trees and plowing with oxen, who worked from sunrise to sundown, also hoped that he could provide for his children—if not his children, his grand-children, some of the luxuries and the ease about which he dreamed.

Now, when we as a civilization achieved, though it may be temporary, we have achieved that degree of luxury and ease we apparently don't know what to do with it, or at least, our knowledge about these stresses of which you spoke that create mental illness is so little that we no not know what to make of the future.

I have been quite interested in a solution of that problem and I wondered whether or not the philosophy of my grandfather that everybody ought to work from sunup to sundown, at least 6 days a

week, may not have been a pretty good one.

Dr. Lisansky. I am sure it would be very good, but unfortunately we cannot create this artifically. We are reaching an age of automation and it is apparent that before too long we will be down to 30 or 20 hour work weeks.

The great problem I think, that confronts us when we give people the leisure is then what. When we make strides in medicine that

permits people to live longer, then what.

We have given the people all this time and leisure, but we have not yet solved this problem how to live a satisfactory life with this leisure.

Mr. Elliott. Then we come along and we say to everybody that since we have made your life longer and we have cut the workweek and we have provided time at least for leisure, and recreation, we say to the worker who may be in perfectly good health he has to quit at 65 or sometimes 60 or 62.

It seems to me that sometimes the cruelty of our civilized rules is

very great in that respect.

I can think of nothing more cruel than to stop a man from working who is in the prime of life and in the prime of knowledge of his

occupation and to say to him that you are chronologically 62 years of

age and you have to quit.

It seems to me that a lot of this, certainly from the standpoint of mental illness, that we are not decreasing the mental strain when we say to a perfectly satisfied worker that you have to quit tomorrow. The strain following such an experience is often—and I am not a trained person in this field—observable, I think, by even the layman.

Dr. Lisansky. It is such an artificial situation. In the universities, for example, there is a mandatory age of retirement. It varies from

one university to the next, but it varies from 73 to 65.

Most men who have been teaching and thinking most of their life have not reached the point of senility at 60 or 65. Yet the rule is that

they must retire at that point.

It has always seemed to me to be grossly cruel and unfair. It seems to be more cruel and unfair in the case of individuals who do not have resources within themselves to live with in their remaining years.

The thing that I seem to observe most among the older people I notice that when you take work away from them you not only rob them of the sense of usefulness, but they don't have anything left

to fill it with and yet they are energetic and active enough.

Now, I think eventually we are going to have to work out some kind of system, perhaps of part time work or getting society organized in such a way so that there are constructive things that the aged

population can do.

Mr. Elliott. I have a correspondent who has been writing me about his intentions to establish a dozen factories on an experimental basis about the country to work elderly people 4 hours instead of 8, work them from 8 to 12, one crew or shift, and from 2 to 6, or probably 1 to 5 the second shift, but to have a complete change of shift.

He thinks that that in an industrial field may be part of the

solution.

There seems to be no reason why one arbitrarily should decide a

man is not to work when he reaches a particular age.

I have taken some of your time but I will give you some of my time. Dr. Silansky. I want to raise a point that I gather was raised yesterday. It is a point I am not altogether clear about. That point is about the handicapped children.

This bill, H.R. 3465, refers to handicapped persons of employable age. What I have just said about handicapped adults, their need of help in dealing with emotional problems, requires, I think, even

more emphasis in dealing with youngsters.

With those under 16 we are given more effective in lightening the emotional burden they carry in heading off more serious problems.

We know that handicapped children have a hard time developing into sound adults. If such a child is fortunate, he may have a good home and the most understanding of parents who do not make him feel like a cross they bear or like a helpless invalid who must be perpetually dependent on them. Much more typical is the handicapped child who is being crippled emotionally as he grows up by the ever present, painful awareness that there are things other people can do and enjoy that he cannot.

This is the major point we psychologists would like to make.

Prosthetic devices are not enough. Special education and voca-

tional training are not enough.

Emotional rehabilitation: counseling and psychotherapy, needs to be available in all rehabilitation programs for adults and for children, which used to be available in all recreational programs for adults and children.

Perhaps you can spend a few seconds explaining to me why the

bill just covers individuals of employable age.

Mr. Elliott. The bill is sort of like a complaint that a lawyer might file when his client gets his fingers mashed off. He always sues for a lot more than he thinks he will get.

The analogy with respect to the bill is this: The bill is just a working model. The suggestions for changes that you make are

very, very good, and they will be taken into consideration.

The bill that we finally bring out of this committee, in my judgment, will not bear too much resemblance to the bills that are before us. The bills that are before us are working models. They are somebody's ideas of a starting point.

We will endeavor to improve those as we go along.

Your testimony has been very helpful, and I thank you very much, Dr. Lisansky.

Now, Captain Donovan, I told you that you would be next. You will be limited to 10 minutes, and you may proceed.

STATEMENT OF CAPT. JEROME F. DONOVAN, MEMBER, BOARD OF THE ALEXANDER GRAHAM BELL ASSOCIATION FOR THE DEAF

Mr. Donovan. Mr. Elliott and members of the committee, I am grateful for your invitation to appear before this committee in my dual role as the father of a deaf child and as a member of the board of the Alexander Graham Bell Association for the Deaf.

In both capacities I desire, first of all, to give my unqualified sup-

port to House Joint Resolution 494.

I feel that I can best justify my support by telling you the story of my deaf daughter. It is quite personal, but I feel that it will open

another window on the problem of education of the deaf.

Mary is the youngest of our five children. She is just 16. We did not realize that she was deaf until she was about 2½ years old, when she should have been doing quite a bit of baby talking. She was noisy enough, but suddenly it dawned on us that she did not respond unless she was looking at the source of the speech.

Clinical tests proved our suspicions, and we were advised to train her as a deaf child. Our knowledge in this field was nonexistent, and Johns Hopkins directed us to the Volta Bureau of the Alexander

Graham Bell Association.

We were furnished invaluable advice on schools and correspondence

courses.

Mrs. Donovan and I then visited most of the oral schools on the east coast, but they were either filled, or were not equipped to handle Mary on a full-time boarding basis, which was a necessary condition to my service duty at that time.

We were finally fortunate enough to have Mary accepted by St. Joseph Institute for the Deaf in University City, Mo., where she has been a student for 12 years. She will graduate this year, has usable speech, and unusual facility in lip reading. She is going back next year for a postgraduate course, in order to orient her further for a useful life in the world of the hearing.

I tell you these things because I know that we are among the most fortunate of parents. Our child has received a fine education, combined with love and understanding. She is accepted by our community in her own right, and she has brought the problem of the deaf to many

of our townspeople, to their great enlightenment.

She is a fine athlete with many friends, and is probably the best known member of our family among the younger generation.

On a personal note, she has done great things for our family in

teaching unity and purpose.

Now, the point of all this leads up to the fact that there are, to my knowledge, many, many families with the same problem, who cannot get an adequate education for their deaf children. We hear from them, and we try to help them, but there just aren't enough qualified educators to handle them.

My oldest daughter became so keenly aware of this that after graduation from college, she took graduate work and is now a teacher of the deaf at the Lexington School in New York. My three sons do

their share as well.

Deafness is a profound thing. To see the light in the eyes of a child who hears through sight is truly inspiring. Education of the deaf cannot work miracles, but it can, when provided for, come awfully close.

Mr. Elliott. Thank you very much, Captain Donovan. That is

an inspiring story.

Mr. Donovan. Thank you, sir.

Mr. Elliott. Now, I promised to recognize John A Kirchner, because he came down early from his post as chief of otolarnygology in the Department of Surgery, Yale University.

Dr. Kirchner, will you come around, please sir.

STATEMENT OF DR. JOHN A. KIRCHNER, CHIEF, OTOLARYNGOLOGY SECTION, DEPARTMENT OF SURGERY, YALE UNIVERSITY

Dr. Kirchner. I am very grateful for this opportunity and for the invitation of the committee to appear here.

I would like to make just two or three points on the bill No. 494 which I think should be in your thinking as this goes into final form.

In the surveys that are made in the school systems the school nurses go through the schools and test the hearing of children in the third grade, in the sixth grade, or whatever it is, and they do in fact find 4 or 5 percent of children with hearing impairments.

Now, of this 4 or 5 percent, some of them are deaf only in one ear, so

that they are not a handicaping problem.

Many children go through life, or until they are tested, with one ear completely deaf and they think this is the way people hear and they do quite well in their school work.

On the other hand, those who are hard of hearing in both ears will fall into two groups. They fall into group of nerve-deafened children, as Captain Donovan just explained to you, and these are problems in special education. They are terrible problems.

The other group, however, which makes up most of the group of hearing problems that are uncovered in surveys, are what we call

conductive deafness.

Now, this is due to recurrent ear infections or obstructions by adenoid tissues or tonsils, sinus infections. These are medical problems. They are not problems in education at all.

We can cure most of these, as has been pointed out in the bill here, except they did not point out that they are remedial, but it does not

say by medical means.

These children are not problems in education. They are problems

for medical treatment.

Now, in this bill on page 2, whereas some 8 million Americans of all ages suffer from speech or hearing impairments or so forth, this makes up about 5 percent of the population, I think, roughly between 4 and 5 percent.

This, I believe, includes these conductive-deafened children or

people with medical conditions.

I do think that this is something that should be looked into a little.

These are not problems in education at all.

The next premise, that this large section of the population suffers from hearing, speech defects, the majority of which are remedial, again there should be added "by medical means."

The next premise, whereas 20,000 speech pathologists and audiologists are needed to properly diagnose training and train people, this is a little misleading because if you are dealing with nerve-

deafened people you need a teacher of the deaf.

The speech pathologists and audiologists should work in a medical setting where they are seeing the great mass of people who have medical conditions who can be treated and helped. These people should be trained in the medical setting. They should not be trained in schools of speech, in my opinion, because, of those that we have had from schools of speech and education, it has been a year before they have been able to acquire enough clinical feeling to really be much help to us.

It takes at least a year in a medical setting.

The other point I would like to make here is on page 5 on the Advisory Committee of the Commissioner of the 12 people there is not a physician among the 12. Six of them are to be engaged in teaching the deaf; three are to be from institutions of higher education, affiliated again with institutions where they are training teachers of the deaf, and three shall be individuals representative of the lay public who have demonstrated an interest in the education of the deaf. I think a little medical diagnosis might be in order on a problem this large.

The last point I would like to make is on the first page, whereas at least six of the institutions accredited for the training of the teachers of deaf have no trainees enrolled for the current academic year, I

would raise the question: Why haven't they?

I do not think that setting up stipends and scholarships is going to attract people into this field. It is rewarding for people who are emotionally and psychologically attuned to it who can work with an individual for long periods of time and years and see just a little progress but it does not attract people generally. I think in talk you would find more people interested in audiology or speech pathology

than you would in training deaf children.

The results are faster and I think much more rewarding to the average person. It takes a special type to go into teaching of the deaf. I think that of this group the figures that are quoted here are far too high, the number of people that are going to be needed. Twenty thousand speech pathologists and audiologists: I would seriously doubt this. I think the physicians can cure a great many children who, I think, are going to be seen by this group, the way the bill is written. This is all I would like to bring out, Mr. Chairman. If you have any questions to direct to me, I shall be glad to try to answer

Mr. Elliott. I just want to thank you, Doctor, for giving us the benefit of your observations about the bill. You have made some very

excellent points for me.

Dr. Kirchner. Thank you very much.

Mr. Elliott. Now, then, our next witness is Dr. S. Justus McKinley, president of Emerson College, Boston, Mass.

STATEMENT OF CHARLES J. KLIM, ASSISTANT PROFESSOR, SPEECH PATHOLOGY, EMERSON COLLEGE, BOSTON, MASS.

Dr. KLIM. I am Dr. Klim, from Emerson. I spoke earlier this morning. Dr. McKinley said because of the last day of college if he could not come or did not arrive on his time that I was to go on record as to support for him the 494 and 371 and also the recommendation made yesterday and turned in by Mr. Philbrick on the speech workshop that was carried on during the week. So in order not to take up any more time I think that will be sufficient for this purpose.

Mr. Elliott. Thank you very much. Now, is Dr. Burton Blatt here, professor and chairman, Speech Education Department, Southern Connecticut State College, New Haven?

STATEMENT OF BURTON BLATT, ED. D., PROFESSOR AND CHAIR-MAN, SPECIAL EDUCATION DEPARTMENT, SOUTHERN CONNECTI-CUT STATE COLLEGE

Mr. Blatt. I appreciate this opportunity to testify before this committee. I would like to make three points in reference to special

education for the mentally handicapped.

Now, the enactment of Public Law 85–962 in September 1958 will undoubtedly prepare more teachers of the mentally handicapped through the training of college instructors. There is real doubt that the quality of the new teachers prepared, albeit in great numbers, will be very much improved.

The enactment of this bill is an important milestone and it was a good bill. However, I think the Federal Government should sponsor legislation to support Federal grants for research in better ways to prepare teachers of mentally handicapped children and teachers of other kinds of handicaps. So far as I know there has been no project ever supported by the Federal Government in the Department of Health, Education, and Welfare in investigations into ways in which we can better prepare teachers.

For example, most of our teachers being prepared today are prepared through the traditional modes and lectures, discussions, visita-

tions, student teaching.

I have a particular feeling that we can do better for these teachers through a more clinical type of education, similar in some respects

to the education of physicians and psychologists.

I speak particularly of a program that we inaugurated a year ago whereby we provide extensive observations of children in an observation room having one-way vision and hearing, where we can observe the children with a master teacher and where the students can learn their theory through observation of children and post mortens in our clinic afterward; this, in addition to the lectures, discussions, visitations, and student teaching, we feel strongly, will prepare better teachers.

We have submitted a research proposal to the Federal Government in order to make an extensive investigation of this particular technique and we hope that it will be accepted. This is only one method. I think that there are many, many other ways we can do a better job of preparing teachers. I think because of the great need for special class teachers today, too many of us are forgetting the fact that the quality of this preparation is in many ways more important than the numbers we graduate.

It has been said in the past that in many places special education is neither special nor can it be considered education and to provide classrooms for 15 children to sit with a teacher who is unprepared or not as qualified as she can be, is probably to do no more for this child

than if we would leave this child in the regular grades.

My second point is in a request for the Federal Government to investigate methods through legislation to support institutions that have been attracting large numbers of superior students who are will-

ing to major in this program.

This is not a common situation. Most universities and colleges cannot attract students. However, there are some, and we are one of them, that have, year by year, turned away many qualified people who have completed 2 years of college and wish to major in our program and we have no room. We can point this out by citing a few statistics.

We have at the present time in our junior and senior undergraduate program 87 students who are majoring in the program to prepare

as teachers of the mentally handicapped.

According to our surveys this probably represents the largest undergraduate department of special education in the country. We will need by September 1961 in the State of Connecticut, because of the passage of mandatory legislation for both trainable and educable children, a minimum of 193 new teachers based on a 2 percent incidence of mental retardation which is a very conservative incidence, and probably as many as 500 to 526 teachers based on a 3 percent incidence.

Our college, plus the students that will be graduated from the graduate program at the University of Connecticut, and the University of Hartford, will, together, prepare 150 candidates to meet this need by 1961.

In spite of a severe shortage by 1961 our college will probably have

to turn away 100 students who want to major in our program.

At the present time we estimate we have 150 to 175 speech educa-

tion majors.

Now, what I am proposing as a possible way to solve this problem is for the Federal Government to pass legislation to provide specialists through the Health, Education, and Welfare Department to be assigned to particular colleges for 1 or 2 year periods. I am asking this because many colleges than can expand, that have the students to expand, are reluctant, in view of the fact that when you hire a new faculty member you are almost arranging a marriage that is for life, and if the enrollments continue to increase, then the college is happy, but if the enrollment the next year goes down the college is left with a faculty member without an assignment.

I propose that the Federal Government sponsor legislation for those programs that are willing and able to expand greatly and rapidly for the first year or two of this expansion to see how far this expansion

will go and if it will continue.

This will permit the college to expand without feeling pressured by

a sudden loss of students in the years to come.

I think in addition to this, and I am not sure how the Federal Government can make this next request, money must be appropriated for library materials for institutions of higher learning that have such programs.

The libraries in many, many institutions of higher learning are

very inadequate in these specialized fields.

My third point is to request the Federal Government to support projects and ideas that have been trying to reject the stereotyped, straitjacketed atmosphere commented on in the literature and in our work.

Unfortunately there is a great discrepancy at this time between what research tells us and what is practiced and what is taught in

our coneges

I would like to submit to you a paper that I have recently written, entitled "Some Persistently Recurring Assumptions Concerning the

Mentally Subnormal."

If I may take a minute to read 10 quick conclusions into the record, you may be able to appreciate the differences between feeling and teaching and what our research tells us.

These conclusions:

1. Blatt, Burton, "The Role of the State Teachers College in the Preparation of Teachers of the Mentally Handicapped," American Journal of Mental Deficiency, 63: 942-947, May 1959.

2. Fields, Harold, chairman, "Who Makes the Best Teachers of Mentally Retarded Children?" American Journal of Mental De-

ficiency, 58-259, October 1953.

3. _____, "Thoughts About College," the Goddard Bulletin, 21:1, May 1956.

4. Goldberg, I. Ignacy, "Profiles in Special Education Personnel,"

Exceptional Children, 23: 240, March 1957.
5. Lord, F. E., and Wallace, Merry Maude, "Recruitment of Special Education Teachers," Exceptional Children, 15: 173, March 1949.

6. Mackie, Romaine P., "Some Problems in the Education of Handicapped Children." Federal Security Agency, Pamphlet No. 112, Washington, U.S. Government Printing Office, 1952. 12 pp.

7. Mackie, Romaine P., and others, "Teachers of Children Who Are Mentally Retarded." U.S. Department of Health, Education, and Welfare, Washington, U.S. Government Printing Office, Bulletin

No. 3, 1957, pages 68, 69.
8. Tenny, John W., "Preparing Teachers of Mentally Handicapped Children," American Journal of Mental Deficiency, 58: 566-572, April

1954.

9. Tessmer, Eleanor, and others, "Undergraduate College Training Facilities for Teachers of the Mentally Handicapped." Unpublished

student report, New Haven State Teachers College, 1957.

I think the Federal Government can help us all in a coordination of thinking and a sharing of research findings through a clearinghouse of research that would function in disseminating the vast hoard of research data that is being accumulated through the generosity of the Federal Government and other agencies.

I think the Federal Government can help us through the publication of bulletins and abstracts of findings in this field, both from the

United States and foreign countries.

I think that the Federal Government can help us through the publication of monographs that would otherwise not be published due to the financial cost involved.

I think the Federal Government can help us through the sponsorship of workshops and seminars of regional nature to share these theories in research findings.

I appreciate your invitation to me. Mr. Elliott. Thank you, Dr. Blatt.

(The formal statement of Dr. Blatt follows:)

SOME PERSISTENTLY RECURRING ASSUMPTIONS CONCERNING THE MENTALLY SUBNORMAL 1, 2, 3

"believe those who are seekin gthe truth; doubt those who find it" -André Gide

(By Burton Blatt, Ed. D., professor and chairman, Special Education Department, Southern Connecticut State College)

In 1948, Goldstein published a penetrating paper dealing with causes, characteristics, and implications of mental deficiency. This work received a great deal of attention, partly, it is supposed, because of its clear and readable style (a rare and commendable achievement today) and, more importantly, because

¹Presented at the Workshop in the Rehabilitation of the Cerebrally Palsied and Other Disabled Persons, Springfield College, Springfield, Mass., July 8, 1959; presented at the Council for Exceptional Children, regional meeting, Providence, R.I., Nov. 17, 1959.
²The author is indebted to George Brabner, Jr., and Seymour B. Sarason for their valuable suggestions and encouraging support.
³Because of the absence of a consistent and universal nomenclature, it should be pointed out that, for the purpose of this paper, the term "mentally subnormal" is used as an all-inclusive classification embracing all individuals functioning below normal intellectually.
⁴Goldstein, I., ""mplications of Mental Deficiency," Occupational Education. 5: 149–172, 1948 ("mental deficiency" is used here generically).

it purported to separate fact from fiction, "* * * cite the fact, nail the lie; construe the implication; act."

Goldstein's paper originally deserved its place of prominence as a recapitulation of existent practices and assumptions from which were derived a series of definitive statements concerning mental subnormality. However, evidence brought forth during the decade since the publication of his work and the disconcerting questions raised by research completed, and suggestive of research yet to be done, limits the usefulness of his article to its gross impact in upgrading the understanding of the unsophisticated and the uncritical. Today, the student examines "Implications of Mental Deficiency" and is not sure what is fact and what is fiction, what is myth and what is reality.

Because of the continuing tendency of many special educators and researchers to base decisions and actions on unwarranted assumptions, and considering the diligent research of those who have provided a few answers during the past years, it is desirable at this point to reexamine some of Goldstein's facts, determine their right to this label, and offer other possibilities for considera-Unfortunately, much of Goldstein's position of 10 years ago is, today, accorded almost universally unqualified acceptance by teachers, authors, other professionals, and institutions of higher learning. Therefore, the purposes of this paper seem clear: to reduce the rigidity of a profession that resists change; to provoke the creative to seek answers; and to instill a healthy unrest in all who work with the mentally subnormal.

I. FACT OR FICTION?

"Mental deficiency is basically a physical or constitutional defect. Abnormal, incomplete, or arrested growth of certain cells results in the crippled arm, the crippled leg. Similarly, although not always as outwardly apparent as in the instance of the crippled leg, deficiencies in brain structure or defects of somatic organization result in mental deficiency. Mental retardation is thus a symptom of some constitutional disturbance or defect."

Analysis: A review of pertinent literature leads one to the unmistakable conclusion that children, variously called mentally retarded, subcultural, "familial," nonorganic, aclinical or garden variety, do not, as a group, upon the most thorough neurological and psychological examinations, exhibit "* * * deficiencies in brain structure or defects of somatic organization." Sarason and Gladwin sum up the neurological consensus by stating that the mentally retarded, who constitute the bulk of those in public school special classes and the majority of "high grade" institutionalized children, presumably do not exhibit any central nervous system pathology.7 They call attention to the need to differentiate this group, called mentally retarded, from the mentally deficient who have demonstrable central nervous system disorders and who probably will never achieve a normal social and intellectual status.

Therefore, in the absence of any evidence to the contrary and until that time when such evidence is forthcoming, mentally retarded children who exhibit no central nervous system pathology should be assumed free of constitutional dis-turbances that in some way act to produce inferior intellectual development. It appears to this writer, from the standpoints of educational programing and research, that an uncritical adherence to a traditionally all-inclusive concept of mental subnormality, which rules out the possibility that these children have intact central nervous systems that have capacities for at least typical development, is a dubious practice for the following reasons:

1. Such a viewpoint is unduly restrictive to the researcher in that its emphasis on the apparent irremediability and constitutionality of this condition detracts from potentially promising investigations into the role of cultural and psychological variables on mental subnormality.

⁵ Ibid., p. 149.
⁶ Ibid., p. 150.
⁶ Ibid., p. 150.
⁷ Sarason, S. B., and Gladwin, T., "Psychological and Cultural Problems in Mental Subnormality: A Review of Research," Genetic Psychology Monographs, vol. 57, 1958, p. 17. (Also published in monograph form in the May 1958 'ssave of the American Journal of Mental Deficiency and in the Basic Books Edition of 1958. In addition, it is included in the 1959 edition of Sarason's "Psychological Problems in Mental Deficiency."

2. It establishes unwarranted limitations on what might be attempted and accomplished educationally with mentally subnormal individuals to improve their intellectual, social and psychological functioning.

3. It relegates to public school special classes for the mentally subnormal. thousands of children for whom such "educational" placement may not be indicated in the light of our professional understanding and knowledge, or justified on the basis of a "diagnosis" of mental retardation. This "diagnosis" and placement largely determines the future course of the lives of these children.

4. It engenders in the teacher a predeterministic mental set which discour-

ages experimentation and hope in the classroom.

5. A positive position does not assume that, in the absence of demonstrable central nervous system disorder, the possibility of organicity is ruled out. Rather, it recognizes that neurological procedures and criteria are not now completely valid or reliable and this positive position is taken in the interests of research and experimentation.

Implication: If this large group of children, described above, does not exhibit central nervous systems that are different from the typical group, the question to be asked is, "Why are these children mentally subnormal?" It must be determined whether these children are subnormal as a result of functional rather than constitutional causes. It should be noted that the evidence available, albeit scanty, points to the conclusion that a great number of those children, presently classified as mentally retarded, cannot be so classified using Goldstein's definition.

II. FACT OR FICTION?

"Mental deficiency exists from birth or early age * * *" * " * is incurable and irremediable." 9

Analysis: As long ago as 1952, Kirk cautiously generalized that nurture may be an important underestimated factor in the causation of mental subnormalitynot all mental deficiency exists from birth or an early age.10 In trying to locate preschool children with IQ's between 45 and 80 for an experimental study, Kirk contacted schools for the names of siblings of known school-age retardates, social agencies, clinics, pediatricians, and public health department officials. His search was relatively unsuccessful. He found a few children "* * * referred by doctors were grossly deficient, with retardation usually of organic nature, but a large percentage of children from all of these sources was found to be of average intelligence * * *" 11 Since it is generally agreed that highgrade mental defectives are frequently found in subcultural environments and. as a result of Kirk's lack of success in finding such children at preschool ages, there is a suggestion:

"* * * that many children later placed in special classes or institutions are not mentally retarded in terms of intelligence test scores at the ages of three, four, or five. Some children, whose older brothers and sisters were in special classes, tested approximately normal at the preschool ages. This raises the question as to whether children from low cultural levels who are approximately normal at an early age may later become mentally retarded because of their

cultural environment or other unknown variables." 12

Implication: Kirk's experiments with the early education of the mentally subnormal once again raises the controversy of nature versus nurture in the development of intelligence. In a recent (1958) publication, describing the results of a 5-year experiment analyzing the effects of preschool education on 81 young mentally retarded children, Kirk outlines both the nativist and environmentalist points of view. 33 The nativist's position is clear: intelligence is mainly a factor of central nervous system maturation from conception on; childen grow evenly at their own rates; early stimulation will not increase potential; mentally subnormal children cannot be made "normal," regardless of any kind of training or education now known; when such changes in intelligence do occur, they are more than likely due to errors of original diagnosis; mental subnormality is incurable and irremediable.

Goldstein, op. cit., p. 151.
 Shida, p. 150.
 Kirk, S. A., "Experiments in the Early Training of the Mentally Retarded," American Mirk, S. A., "Experiments in the Early Train Journal of Mental Deficiency. 56: 692-700, 1952.

Ibid., p. 697.
 Ibid., p. 698.
 Kirk, S. A., "Early Education of the Mentally Retarded." 216 pages.

The position of the environmentalists is less clearcut but, from this viewpoint, more promising: within broad limitations, the development of children is significantly affected by the kinds of early rearing they have experienced; to explain all changes in intelligence as being due to erroneous original diagnosis only beg these intriguing questions. Why are researchers unable to locate preschool educable mentally handicapped children? What are the conditions that promote increments in intelligence among certain children?

A review of Kirk's findings raises the following questions in the mind of the

serious student:

1. What is the significance of the acceleration in rates of growth of 30 (in a

total sample of 43) children who received preschool education?

2. Why did the study disclose that it was much more difficult to displace the rates of growth of organic children than nonorganic children? (However, one may argue that the apparent irreversible defect, of the organic child may be due to the educator's inability to adequately compensate for this defect. A dramatic example of the use of compensatory educational techniques can be found in a study of the education of Helen Keller).

3. Why was it generally found that the greater the changes made in the

environment, the greater were the changes in the rates of growth?

It is interesting to note that: familial educable children do not usually exhibit mental subnormality during the preschool years (the Columbia University research project on the effect of group training on 4- and 5-year-old children who are mentally retarded, has unofficially reported similar findings); familial educable adults marry, find jobs, solve problems on a typical level, and maintain themselves independently and indistinguishably in the community; 14 it appears that only when this individual is of school age, is he diagnosed and does he function as mentally subnormal; it appears almost as if the schools predestine the child to mental subnormalcy. Therefore, it would seem logical to designate the nature-nurture issue an open one and to find answers to the following problems:

1. What is the relationship of cultural and psychological variables to early rearing practices and their effects on intellectual growth and development?

2. What are the factors comprising this general ability we call intelligence and how can they be more adequately measured?

3. What is the relationship, if any, between test problem-solving behavior and nontest problem-solving behavior? Do different racial, religious, and cultural groups score differently on conventional tests of intelligence because of actual differences in innate intelligence or because of the ways children are brought up to solve problems?

4. What is the relationship between motivation and status goals? Is academic

achievement a status goal of all who go to school?

III. FACT OR FICTION?

Mental subnormality "* * * results in the inability of the individual to profit from ordinary schooling * * *" 15 and "* * * by providing him with a different educational program suited to his needs, we can make him more capable of facing

the world which lies ahead of him." 16

Analysis: No one, who has worked with mentally subnormal children in school, would question the validity of Goldstein's remarks. However, one may question the implication that there is substantial evidence as to what the proper program Thould be. From his article, one can conclude that retarded children in special classes are receiving a great deal more purposeful education than retarded children in regular classes.

In a rare moment of candidness, a distinguished special educator recently remarked, during a meeting in which this writer participated, that special education isn't special nor can it, in many instances be considered education. Studies find that, insofar as measurable abilities are concerned, mentally handicapped children in special classes are very similar in development to those in regular

Sarason and Gladwin, op. cit., pp. 13-50.
 Goldstein, op. cit., p. 151.
 Ibid., p. 165.

In fact, the earlier studies of Bennett and Pertsch found that retarded children in special classes did poorly in physical, personality, and academic areas as compared with retarded children in regular classes. Later studies by Blatt and Cassidy found few significant differences between those children in the regular classes and those in special classes. Notwithstanding the many valid criticisms of studies comparing special versus regular class membership, it has yet to be demonstrated that special classes offer a better school experience for retarded children than does regular class placement.18

Certainly, there is little evidence to support the fact that special class provisions, even the best available today, are the millennium; nor can we even say

that the best of our special classes are "good enough."

Implication: Disturbing as it may be to those who have conscientiously developed curriculums for the mentally handicapped, and while providing convenient rationalizations for the "do-nothings" who reject responsibility by saying either we do not know enough to plan or each teacher should plan according to the individuals in her class, there is little evidence to support the widespread notion that, by placing mentally handicapped children in conventional special classes, society is meeting their educational needs. There is no doubt that this group of children, regardless of etiology or permanence of condition, requires special provisions in school. There is doubt, at least among some educators and psychologists, as to what should constitute the program of special education and who can benefit from it. In this regard, some intriguing questions to be asked are:

 How many children are placed in special classes after careful differential diagnosis? How many are placed after the simple administration of Binet and WISC tests? Does the administration of these tests constitute a differen-

tial diagnosis?

2. Using more than the limited evaluations to be derived from the IQ, how many children in special classes do not belong there? Do we have a moral obligation to these children regarding diagnosis, placement, and the ultimate effects of these on their lives?

3. What are the best ways to teach mentally subnormal children to read, to understand numbers, to understand themselves? What is different about the methods, materials, and content in special classes commonly found today?

4. What is really meant by the statements:

(a) "She is not a good student but she may make a good teacher."

(b) "This person isn't a skilled teacher but she has a good attitude. will not do any harm to children."

(c) "We can't measure the differences, but these children in the special class are receiving a finer education than if they were to remain in the regular grades."

Do these statements indicate that we don't know how to evaluate special education because we, as yet, do not know what special education should be?

The implication here is evident. What is needed is an infusion of bold, creative thinking into the field. Experimentation with new and unorthodox methods and materials must be encouraged. A more discerning study of the mountain of research in education, special education, psychology, anthropology, and sociology must be made in order to separate the valuable from the nonessential. We must reject many of our present curriculum practices because they have been so eminently unsuccessful. When Goldstein describes the retarded as "* * * incapable of logical thought, unable to make generalizations or work with abstractions," and therefore, "* * * responses must be habituated. He must be taught specific responses to specific situations," is he merely perpetuating the retardation with the supposed educational treatment? 10 Is there

the possibility that, for some children, the retardation is due to an early rearing emphasizing habituation? Can some retarded children profit from programs involving creative thought processes rather than from the continuation of "straitjacketed" stereotyped curriculums which reflect the same kind of thinking?

IV. FACT OR FICTION?

"The general consensus at the present time seems to be that 40 to 50 percent of mental deficiency are of a hereditary nature * * * " 20

Analysis: The recent work of Sarason and Gladwin has pointed up the meagerness of the evidence subscribed to by adherents to hereditary theories of mental

subnormality.21 Their investigations have convinced them: "* * * that a hereditary determinant of mental capacity must not be assumed to exist unless proven. Furthermore, proof should be sought in terms of our present knowledge of human genetics and of the nature of human intellect, rather than, as is commonly done through the administration of routine intelligence tests to a variety of 'racial' and other groups. We do not propose to deny that heredity is a factor, particularly in mental deficiency, but rather that we should leave it out of our accounting until it is supported by more than speculation and bias." 22

Implication: Every day, recommendations are being made in regard to sterilization, prohibition of marriage, court placement of children, and counseling of adults—all based on the assumption that mental subnormality has a genetic basis. Should such crucial decisions be made without more evidence? What are the genetic factors, if any, in the causation of mental subnormality?

V. FACT OR FICTION?

"He (the mentally subnormal) is more liable to illness and physical defects and generally lacks the physical stamina of the normal child." 25

Analysis: Blatt reviewed a great many studies:

"* * * concerning the physical status of children who are mentally retarded. Although there was disagreement among researchers, the consensus seems to indicate that there is a positive relationship between intelligence and various indexes of physique. However, this relationship is not invariable and appears to be too minor to be useful for predictive or educational purposes. This relationship does not appear to be linear in character and it may be more significant in the more severely retarded group." ²⁴

The mentally deficient are not necessarily "limited in physical prowess." 25 Especially among the group called familial, there are many who far surpass the norm in every aspect of physical ability. Mentally subnormal children do not have to be malnourished. They do not have to be poor athletes. They are weak for the same reasons that typical children are weak; they are strong for the same reasons. Because a significant percentage of these children reside in substandard environments and because a significant percentage have central nervous system impairment, some retarded children are physically limited. The

bulk of those in the "higher grade" category are not.

Implication: Mentally subnormal children do not necessarily have to be physically limited. To assume that these children are so limited because of mental inability is to use a handy but poor excuse to remain inactive when rehabilitation may be indicated. We do not explain malnourishment in a gifted child by quoting his high IQ; evidence dictates that we do no less for the subnormal. It is ironical that, as a group, mentally subnormal children both in special and regular classes surpass their academic expectancy as measured against their mental age.26 In spite of this, special class teachers continue to feel their greatest anxiety in reconciling actual reading and arithmetic achieve-

(Studies of characteristics of the mentally retarded, using this term generically, often become meaningless because of differences in abilities among the various subgroups considered retarded. Particularly in the area of physical status, it should be emphasized that there are very significant differences between organic and nonorganic children, and between higher grade and lower grade children.)

ment of children with what teachers expect and hope for. Fewer teachers have anxious moments rationalizing physical education and health programs for these children regardless of what is being accomplished and what can be accomplished.

VI. FACT OR FICTION?

"Early studies (circa 1900), purporting to show that as high as 85 percent of delinquents and criminals in the studies were mentally deficient, have been challenged. Today the figure is believed to be closer to 50 percent." 27

Analysis: In a recent review of the literature, Blatt found numerous studies, with few exceptions written at least 15 years ago, reporting high relationships between delinquency and intelligence.²⁸ More recent research reports low relationships, "J" shaped in character, and suggest the following factors that

influence these relationships and affect their validities:

1. There appears to be a multiplicity of causes of criminality and delinquency. Lower IQ, per se, does not play an important role in the causation of such behavior unless this factor combines with other causes (as Goldstein points out) such as: poor homes, mental disease, alcoholism, and marital strife among adults and school failures, poor neighborhoods, unrealistic education, and community rejection toward children.

2. Some delinquents receive low IQ scores on tests because of their sub-

cultural environment rather than as a result of constitutional defect.

3. There are selective factors operating with respect to the intelligence level of delinquents in institutions. One institution may not admit the subnormal while another may care for this type of child exclusively.

Brighter delinquents may escape detection and apprehension.

5. On the basis of a more promising prognosis, the mentally able delinquent may receive a suspended sentence while the subnormal child, com-

mitting the same act, may be placed in an institution.

In summary, "* * * it appears that the retarded are more frequently represented among delinquent populations than typical groups but this representation may not be as significant as once was believed. It is probable that the relation-ship between intelligence and delinquency is 'J' shaped in character. The group known as 'borderline normal' may comprise the most significant population among delinquents." 29

Implication: Mentally subnormal children do not have to become delinquents; nor can we explain delinquency as a manifestation of the subnormality. It is not surprising that some of these children become delinquents; it is amazing that more do not. Society must recognize the need for psychiatric and social services, realistic education, and vocational counseling for all its citizens. More importantly, we must cease looking with derision at those in a different cultural

milieu.

CONCLUSIONS

1. A great many children, presently classified as "familial" mentally subnormal, should be assumed free of constitutional deficiencies or genetic aberrations that may result in inferior intellectual development.

2. A great many children, presently classified as mentally subnormal, cannot be so classified using the conventional definition that requires constitutional

3. There is impressive evidence that numerous children, presently classified as mentally subnormal, acquire this subnormality sometime after birth or early age.

4. There is impressive evidence that numerous children and adults, originally classified as mentally subnormal, could not be so classified on later evaluations. 5. There is impressive evidence that the role of cultural and psychological

variables in the causation of mental subnormality has been greatly underestimated.

6. There is little evidence to support the widespread practice of placing educable mentally subnormal children in conventional special classes rather than in the regular grades or in some other, as yet unknown, more suitable classes.

[¤] Goldstein, op. cit., p. 154. ⇒ Blatt, op. cit., pp. 39-45. ⇒ Ibid., p. 811 (of A.J.M.D. article, see footnote 14, reference 2).

7. There is a dearth of convincing evidence supporting any hereditary theories of mental subnormality.

8. As a group, educable mentally subnormal children are not significantly dif-

ferent in physical attributes from typical children.

9. There are low relationships, "J" shaped in character, between delinquency and intelligence.

10. Many of the present assumptions in the field of mental subnormality are unsubstantiated by valid evidence, are reinforced with prejudice, and flourish in an atmosphere of rigid and stereotyped thinking.

Mr. Elliott. According to my list that is all the witnesses listed for today with the exception of Mr. Warren MacIsaac, the Calasanctius Preparatory School, Buffalo, N.Y.

Mr. MacIsaac has traveled quite a ways to be with us. We will

hear him at this time.

We are trying to finish, however. If you will make your statement as brief as you can we will appreciate it.

STATEMENT OF WARREN MacISAAC, THE CALASANCTIUS PREPARATORY SCHOOL, BUFFALO, N.Y.

Mr. MacIsaac. I shall. Anything I might say in support of the request that the Federal Government assist schools that are designed for students of exceptionally superior intellectual ability would be a mere echo to the mountains of publicity the subject has received in recent months, indeed, years.

Our own school is perhaps representative. There are very few schools such as ours. It is an independent school, that is to say, unlike some of the schools for gifted children which are supported by com-

munities, public schools.

Mr. Elliott. Is yours a school for gifted children?

Mr. MacIsaac. It is indeed, sir.

Our elementary requirement is an IQ admission of 130 or above measured on the Wechsler-Bellevue intelligence scale for children.

Mr. Elliott. How many children do you have?

Mr. MacIsaac. We have 82 children at the present time.

Mr. Elliott. You have to look around thoroughly to find some-

body with above 130; do you not?

Mr. MacIsaac. We do indeed. We have some students whose combined score would seem to be lower, but whose exceptional ability in one particular area of the test would warrant the risk of admitting the students.

Mr. Elliott. Have you had any experience yet as to what happens

to these children after they finish school?

Mr. MacIsaac. No, sir; the school is now in its third year. It is contending with its financial problems in its efforts to experiment with curriculum.

We are in some measures feeling our way although the headmaster

is an experienced teacher in the education of gifted children.

We have received some gifts from the Buffalo Foundation and a grant from the Federal Government under the National Education

Defense Act for building a laboratory.

We are trying to raise funds for a new building, but all of this is much too individual. The general statement the headmaster asked me to make was that as an independent school we are essentially a church school; the school is owned by the Piarist Order, a Catholic teaching order, which is very well known in the United States. Consequently, it is not attached to any bishopric and, therefore, has no sources from within its religious category. The school has half or more of its students presently under scholarship at considerable sacrifice.

The parents are industrious in trying to raise funds. In short, we would like to suggest that a project of this kind be regarded as a consideration of the Government and such grant as the \$5.600 that the

school received from the Government earlier be enlarged.

The statement I have with me typifies the particular needs of our school, but they are not a request to pay our bills, but rather that we are trying to do things which are unique and very difficult to complete—for instance, the school teaches Arabic, which requires some peculiar settings. It requires, in the first place, an unusual teacher, unusual vocabulary, and alphabet.

We have introduced Chinese on a part-time basis. We have only

one or two students who are making much progress with it.

Altogether these are the issues with which gifted children of the

United States are faced.

I think the observation of Alfred North Whitehead 43 years ago is one of the most appropriate at this time:

When one considers in its length and its breadth the importance of this question of education of a nation's young, the broken lives, the defected hopes, the national failures which result from the frivolous inertia with which it is treated, it is difficult to restrain within one's self a savage rage. In the conditions of modern life the rule is absolute; the race which does not value trained intelligence is doomed. Not all your social charm, not all your wit, not all your victories on land or at sea can move back the finger of faith. Today, we maintain ourselves. Tomorrow, science will have moved forward yet one more step, and there will be no appeal from the judgment which will then be pronounced on the uneducated.

There are few schools such as ours. We would like very much to have consideration of Federal assistance.

Thank you very much. Mr. Еллотт. Thank you very much.

(The following material was submitted:)

RÉSUMÉ OF AN EXPERIMENTAL PROJECT IN THE EDUCATION OF GIFTED CHILDREN, BY ALFRED NORTH WHITEHEAD

Title: Calasanctius Preparatory School; experiment in the more effective scientific and humanistic education of gifted boys from 10 to 16.

Sponsoring organization: The Calasanctius Preparatory School is conducted as a day and boarding school by the order of the Piarist Fathers, Inc., Buffalo, N.Y. This organization is tax exempt as a nonprofit organization and is listed. in the Official Catholic Directory on pages: 834-47A and 339.

Address: Calasanctius Preparatory School, 120 Rumsey Road, Buffalo 9, N.Y.

Directors of the project: Rev. Stephen Gerencser, S.P., Ph. D., S.T.D., headmaster of the Calasanctius Preparatory School, director and coordinator of the project; vice directors: For sciences: Y. Ramon Perez, M.D.; For mathematics: Ellsworth V. Pound, Ph. D., professor emeritus, University of Buffalo; for humanities: Rev. Michael Palotai, S.P., M.A.; executive secretary of the project: Charles R. Kent, M.A.; treasurer: Rev. Henry Mirowski, S.P. M.A.

PURPOSES

In the much neglected field of the education of gifted youths 9-16 years, to pilot a new program and methods toward a more efficient scientific and humanistic education:

(1) To foster the maximum all-round development of which the boy is capable.

(2) Through research and experiments, to improve curricula, texts, and methods of instruction.

Although the school is established for gifted boys, it is hoped that it will benefit not only gifted children, but the students of all American schools.

HISTORICAL BACKGROUND

After many years spent studying the problems of education for gifted youth, the director of this project came to the same conclusion as many thinking Americans: we are wasting our most valuable asset—our gifted youth—in failing to give them an education that will challenge their intellects and help them to utilize to the fullest their potentialities as productive individuals and contributing members of our society.

The school was opened in the fall of 1957 with 16 students in a building given to the school for use for the 1957-58 school year at 1 Agassiz Circle, Buffalo, N.Y. For the 1958-59 school year the Calasanctius Preparatory School moved into its own home (cf. more detailed report in the annual report), 120 Rumsey Road, Buffalo 9, N.Y. The same building served as school building in the 1959-60 school year also.

The number of enrolled students:

Year	Preentrance	I Form	II Form	III Form	Total
1957-58 1958-59 1959-60	7 8	16 26 A:19 B:23	14 20	12	16 47 82

Entrance requirement: Achievement tests and the Wechsler-Bellevue intelligence test for children. The IQ rating should be 130 or above, or in exceptional cases (special ability in certain fields) around 130. Boys are accepted without discrimination in social status, race, or religion.

THE PROJECT AS PLANNED

(1) An experimental phase, to last 6 years, in order to test the planned curriculum and proposed methods;

(2) A continuing phase, in which the school will be maintained along the lines established and evaluated during the first or experimental phase.

TIMELINESS

The climate would seem conducive and the time very ripe for this experiment. Public awareness of the dangers threatening the intellectual development and leadership of America has never been so great as now. As the statement by the President's Science Advisory Committee emphasizes: "Our changing civilization will demand in the future an even greater devotion to learning and a greater pride in intellectual achievement" (p. 30).

In all the four areas outlined by the Committee—(1) The curriculum and content of courses, (2) the quality and effectiveness of teachers, (3) the recognition and encouragement of students, and (4) the development of intellectual leadership—the directors of the Calasanctius Preparatory School are convinced that something positive and valuable can be contributed through our experimental project.

The solution to our present-day educational problems is not a mere increase in the number of schools or extension of the time required for education but rather in the fullest utilization of the intellectual and material resources avail-

able.

PROPOSED APPROACH AND METHODS

The stated goal is not new; indeed, there are today more and more educators becoming concerned over the problem of gifted children in our present educational system, but it is the conviction of the directors of this project that this project has some specifically unique aspects:

(1) A vertical program in all subjects.

taught in the classroom.

(2) A new science program in sequence, content, and integration.

(3) New aspects in the teaching of history, with special emphasis upon the very much neglected Afro-Asiatic civilizations.

(4) Introduction of intensive language study at an early age, not only of those languages usually taught in our educational system but oriental languages as well.

(5) A unified and ascending program for 6 years, continuous in one school and with a closely interrelated curriculum.

(6) Specifically related field studies in close integration with the subjects

PERSONNEL

The teaching personnel is composed in part of members of a teaching order with a longstanding tradition, who individually have extensive academic preparation and practical teaching backgrounds, and in part-time laymen and laywomen selected for their training in their respective fields and for their dedication to the project.

Advisers are qualified and eminent men in their fields and they are assisting

the project as academic or as financial advisory board members.

EXPECTED RESULTS

We expect that this program will result in rich contributions to the development of curriculum, especially in sciences, history, and languages; in more productive use of the years of study between the ages of 10 and 16. We expect that the project will contribute to the recognition and encouragement of students, especially of those with outstanding ability, and to the quality and effectiveness of teaching.

While certain results are expected and indeed can be seen after 2 years of operation, it would be premature to make definite statements of the results before the end of the first 3 years. Tentative remarks about the progress of the school are made in the first and second annual reports. The precise formulation of the results in a more detailed form may be expected at the end of the first 6 years.

We plan to publish progress reports annually describing the development of

the project.

FINANCIAL PROBLEMS

(1) The project's beginnings and progress were and are financed with the contributions of parents interested in the education of their children, of the members of the Order of the Plarist Fathers, and certain members of the lay faculty, who give their time without any reimbursement to the project, and with limited contributions from local businessmen and other friends of the school. One local foundation (Buffalo Foundation) assisted our laboratory program with \$5,000 and the Federal Government (under the National Educational Defense Act) granted a \$5,600 loan for laboratory development.

(2) The project is presently operating from the 120 Rumsey Road, Buffalo, N.Y., property. This former mansion served well the purpose of the school during the transitional period. But the time definitely has arrived when positive steps should be taken to have a final location for the school, with all the necessary laboratories and space needed to develop our program according to our principles. For the promoting of the building of an appropriate plant, a building committee was organized at the end of 1959 among the parents and friends of the school, with the clear purpose of reaching a definite solution by

1961 at the latest.

(3) For the time being the project depends in its operation very much on tuitions and the free contributions of one part of the faculty. But we feel that this dependence and our very liberal scholarship policy may jeopardize the purpose of the school by making it difficult or impossible to select students solely upon the basis of intellectual ability. The ideal situation would be to operate the school as a free school, without any dependence whatsoever upon tuitions or personal sacrifices.

SPECIFIC NEEDS

(1) Necessary funds for-

(a) Science building capable of accommodating our science program.

(b) A combined building, or system of buildings, to accommodate the library, classrooms, etc., in the value: \$1 million to \$1,500,000.

(2) Teaching personnel.—The ideal solution would be to have the necessary endowment for the establishment of teaching posts, especially in the following fields (if the school reaches full development):

Humanistic-language group; Latin, Spanish, French, German, oriental

languages (part time).

Religion and psychology: World history, American history, art, music.

Mathematics: Two teachers.

Sciences: Biology, chemistry, physics, geography-geology.

Our aim is to give proper monetary compensation to our teachers so that they may dedicate their entire energy to teaching and research, preparing textbooks, and to proper educational approaches to the education of the gifted, leaving

opportunity during their vacation period for further studies.

(3) Teaching fund.—Our overall objective in this respect is to insure that the financing of teaching and research work will not have to be dependent on tuitions or the episodic aspects of emergency drives and fund-raising affairs. The latter, of course, have been quite necessary in the absence of any endowment or dependable regular source of income, and at the same time it has been necessary for the individual members of the faculty to make many personal sacrifices. The permanent establishment of one chair for teaching and research, it is estimated, would necessitate a capital yielding \$8,000 per year.

(4) Scholarship fund.—As it is one of our overriding principles to make this educational program available to any boy with recognizable talent and proper motivation, we have from the start not refused any otherwise qualified student whose parents have not been able to pay the tuition. To make possible the

realization of this ideal, the members of the faculty have, during the first year of operation, sacrificed several thousand dollars.

Wherever at all possible, we prefer to give partial, rather than full, scholar-It is our belief that some sacrifice on the part of the parents should be made for each student, the degree to be governed, of course, by the financial status of the parents.

To maintain a full scholarship for one student, it is estimated that a capital fund which would yield \$700 per year would be needed for each student.

(5) Long-term needs.—This program, because of the scope of its objectives, will ultimately be in the \$5 million range; this does not seem a disproportionate amount to spend on the education of the most promising youth of the Nationand it is, of all amounts spent on education, probably the one most likely to return an overwhelmingly great benefit immediately and in the far-reaching future.

STATEMENT BY FRANCES G. KOENIG

American special education, because of its very nature, is involved in relations with many other professional and scientific fields. It overlaps other disciplines. The effectiveness of special education in the United States and its contributions to general education is determined in part by its very dynamics, its ongoing process; by its relationships with the interests, competences, and methods in general education.

Since we hope that our profession will continue to maintain itself as a "good" profession, we should be led to the formulation of action-relevant policies to guide us.

It is my belief that the Subcommittee on Special Education and Rehabilitation should concern itself nationally with acceptance of certain obligations:

1. Promoting research in special education and rehabilitation by emphasizing its importance in the training of teachers and counselors, in awarding scholarships and fellowships, and in professional advancement to the various colleges and universities with special educational facilities.

2. Developing sources of financial support for research.

Fostering the highest ethical standards in the conduct of research.

4. Inviting special educators as members of groups offering assistance to architects in the plans for school construction; convalescent homes, hospital classrooms; special equipment and other devices to aid the physically handicapped.

5. Setting the stage for classes for multiple handicaps, particularly the physically and emotionally handicapped, so as to bridge the gap between

the physical and psychological in the special services required.

6. Offering scholarships to gifted physically handicapped young people with 120 IQ and over on State levels and being realistic concerning jobs and placement; job analyses to be made in advance.

> RHODE ISLAND SCHOOL FOR THE DEAF, Providence, R.I., December 23, 1959.

Hon. CARL ELLIOTT, Chairman, Subcommittee on Special Education, House of Representatives, Washington, D.C.

MY DEAR CONGRESSMAN: It was with deep regret that I found it impossible to be present at the public hearings of the Subcommittee on Special Education in New Haven on December 18.

I earnestly request passage of House Joint Resolution 494, "Title I, Training of Teachers of the Deaf"; "Title II, Training of Speech Pathologists and

Audiologists."

With reference to "Title I, Training of Teachers of the Deaf," the basis for this request can best be stated in terms of need. According to the American Annals of the Deaf for January 1959, page 156, the period 1958-59 shows a marked increase in the number of pupils and teachers in schools for the deaf as compared to the period of 1947-48. At the same time, the number of properly trained teachers failed to meet the needs. For example, a survey during the school year 1958-59, made by members of the staff of the Clarke School for the Deaf and the Hearing and Speech Center at Gallaudet College, indicated a need for over 500 trained teachers, while only 126 trained teachers were available. Turning now to "Title II, Training of Speech Pathologists and Audiologists,"

Turning now to "Title 11, Training of Speech Pathologists and Audiologists," we find an even greater need. According to the December Journal of the American Speech and Hearing Association, 32,000 trained speech pathologists and audiologists would be needed to meet the needs of speech and hearing handicapped children and adults in the United States. At the present time there are only about 7,000 available. It is further estimated that 1,500 clinicians should be trained each year to fill the needs, while actually only 400 are available from

70 schools

If funds could be made available for this training, it would seem reasonable to assume that more individuals could be persuaded to enter this important field of education.

Very truly yours.

JOHN YALE CROUTER, Principal.

PSYCHIATRIC CLINIC FOR CHILDREN, INC., STAMFORD HOSPITAL, Stamford, Conn., December 18, 1959.

Hon. Carl Elliott, Chairman, Subcommittee on Special Education, House of Representatives, Washington, D.C.

Dear Congressman Elliott: As a clinic providing individual psychiatric treatment for emotionally disturbed children we have many occasions to call upon the services of trained special education teachers. The severe types of personality disturbance treated at this clinic frequently involve related handicaps such as cerebral damage, defects of hearing, vision, and speech, as well as specific and general learning disabilities.

While we are proud of existing facilities and the cooperative way in which available services are given, there are times when the lack of a needed special service has limited our effectiveness in treating the problem. Here are a few examples of problems which we cannot now adequately treat because of the

lack of specialized services:

I. Arthur began to show behavior problems when he entered school. His problems were aggravated by a concussion which reduced his effective intelligence from the superior to the average level and left him so out of control that the neurologist who referred him said, "I worry that this boy may kill his father." This boy was given every advantage of our team psychiatric treatment approach and developed inner controls as well as the incentive to cooperate and learn.

Two years following discharge from our clinic, this boy has not made educational gains appropriate to his ability because he requires a special educational approach which has been found effective in dealing with cerebrally damaged children. He is becoming increasingly frustrated with his academic failures and may in time give up at school.

II. Roger is a 10-year-old boy of dull normal abilities who has no basic personality defect. However, he was referred to us by the school because the

teacher "could not reach him." When we studied this child we found he was deeply affected by his school failures and had given up trying to please his teachers. We found he was attending school in an area where nearly all of the children had high average to superior ability. We were told that he was too bright for a special class, although he is hopelessly behind his classmates. Roger's problem was of a kind which we frequently have referred to us. We recommended instruction by a specially trained teacher in a classroom with other children close to him in ability. The school would like to have such a program but sees no hopes of instituting such a classroom in the next few years. The use of our diagnostic service for Roger and others like him is actually a waste of our time since additional special class teaching could prevent his type of problem from occurring.

III. Peter is a 15-year-old boy of average intelligence who was referred to us as a learning and behavior problem. Although he was in seventh grade he could not reliably identify the letters of the alphabet. He has been seen by us for nearly 3 years. In connection with treatment we recommended individual help from a remedial reading teacher but learned that the school does not have enough of these specialists to provide individual help. We found a kindly Sister in a Catholic school who, while untrained in remedial reading instruction, offered to help Peter. We worked out a special school program for Peter and with treatment he began to demonstrate such superior mechanical skills that his shop teacher hopes to sponsor him as a special student at the technical school. He now reads at a third grade level. We felt that earlier attention to his reading disability could have prevented his serious emotional problems from developing.

Such problems as I have mentioned are educational problems frequently found in association with severe emotional problems. In order for treatment to be effective we must often coordinate our treatment with the services of an appropriate specialist. Since so much of today's planning is in terms of reaching the greatest number of children, I would like to point out that a number of professional people are giving intensive service to individual children and are often handicapped by the shortage of individually available special education

services.

Thank you for this clinic's opportunity to voice our views. We feel that Federal support of programs to train and place special education teachers is necessary in order to stimulate communities to think in terms of making wider use of these services.

Cordially yours,

George W. Shultis, Ph. D., Chief Clinical Psychologist.

Fairfield, Conn., Public Schools, December 30, 1959.

Representative Donald J. Irwin, House Office Building, Washington, D.C.

DEAR MR. IRWIN: I am writing to you at the suggestion of your secretary, Miss Gleason. I spoke to her on December 18 and she in turn spoke to you about my interest in Senate Joint Resolution 127. Title II of this resolution provides funds to encourage and facilitate the training of speech pathologists and audiologists.

This legislation is needed because—

There is a desperate shortage of qualified personnel. Please note qualified means those who can work independently at the level of advanced certification with at least a master's degree.

2. There are 9 million Americans of all ages suffering from speech and hearing disorders, as summarized in this table:

Estimated incidence and prevalence of speech and hearing problems among United States 1960 population (continental United States, Alaska, Hawaii, and Puerto Rico)

	1960 popu- lation	Incidence, speech problems	Prevalence, speech problems	Incidence, significant hearing problems	Prevalence, significant hearing problems
Under 5 years (continental United States)	21, 019, 000	Percent 1.3	262, 737	Percent 0.3	63, 057
5 to 19 years (continental United States)	49, 782, 000	5.0	2, 489, 100	.7	348, 474
Over 19 years (continental United States) Alaska, Hawaii, and Puerto	110, 353, 000	3.0	3, 310, 590	2.1	2, 317, 413
Rico (total all ages)	3,000,000	3.4	102,000	1.5	45, 000
TotalGrand total (speech and	184, 154, 000		1 6, 164, 427		2 2, 773, 944
hearing)					8, 938, 371

¹ Speech. ² Hearing.

Thirty-two thousand speech pathologists and audiologists are needed to properly diagnose, train, and rehabilitate our speech and hearing handicapped.

4. At present, there are only 2,000 certified speech pathologists and audiologists and some 5,000 noncertified specialists to cope with this handicapped population.

5. In order to cope with the critical shortage of trained personnel, universities should be graduating at least 1,500 trained speech pathologists each year. We are graduating only 400 each year.

6. The need for speech pathologists and audiologists is great in all States to staff schools, hospitals, and community service centers. In our own State of Connecticut, qualified personnel is not available to fill existing vacancies, or to permit needed expansion of present program.

Title II of Senate Joint Resolution 127 may be summarized as follows:

1. This legislation is proposed to make available funds with which to encourage and promote the advanced training on a graduate level of speech pathologists and audiologists.

2. The bill will result in funds for teaching, equipment, and fellowships for

graduate students in speech pathology and audiology.

3. The Director of the Office of Vocational Rehabilitation, in cooperation with the Advisory Committee on Speech and Hearing Disorders, will establish and conduct this grants-in-aid program.

4. The grants-in-aid will be made only to institutions of higher education that prepare students to qualify for advanced certification in speech pathology or

audiology.

5. The amounts of the stipends will be determined by the Director. It is expected that they would approximate those awarded under the National Defense

You will note that there is a title I (training of teachers of the deaf) and a title II (training of speech pathologists and audiologists) in this legislation. Although I am primarily concerned with title II, I am naturally interested in

seeing the entire bill passed.

I believe this legislation has been introduced in the House as House Joint Resolutions 488 and 494, and I think it deserves your sponsorship and active support. I would like very much to meet you and discuss this further, and answer any questions you may have about the work of a speech pathologist or audiologist. I can arrange to meet you at your convenience whenever you are in Connecticut.

My husband and I have followed with interest your election to and your activities in Congress. We have been impressed by your newsletters with their clear explanations of the positions you have taken, and we appreciate your concern for the plight of the New Haven's passengers.

The speech and hearing handicapped need your help too.

Sincerely,

Lois R. Mayper, Ph. D., Associate Consultant, Speech and Hearing.

Mr. Elliott. Now, as our hearings come to a close, let me express my very sincere appreciation to the members of the Subcommittee on Special Education generally and my special appreciation to the gentleman from Connecticut, Mr. Giaimo, in whose hometown these hearings have been conducted. Mr. Giaimo and his office staff have been most obliging and helpful in making the preparations for these hearings and in conducting them and his friends in the community have been most gracious to myself and other members of our party.

I would like also to express the thanks of the subcommittee to the members of our staff, Dr. Frampton, Dr. Gall, Miss Hartman, Miss Allen, and to our reporter, and a special note of thanks goes to Yale University for its hospitality to the subcommittee and its staff and for giving us the benefit of its rooms for conducting our workshop, which lasted 2 days. That is quite an asset, quite a help to the subcommittee. And then to the witnesses and friends and all, may I close by wishing

you a Happy Yuletide.

(Thereupon, at 4:20 p.m., the committee adjourned.)

SPECIAL EDUCATION AND REHABILITATION

WEDNESDAY, JANUARY 27, 1960

House of Representatives,
Subcommittee on Special Education of the
Committee on Education and Labor,

Cullman, Ala.

The subcommittee met at 10 a.m., pursuant to call, in the Cullman County Courthouse, Hon. Carl Elliott (chairman of the subcommittee) presiding.

Present: Representatives Elliott, Green, Daniels, and Giaimo.

Also present: Representative Albert H. Quie.

Staff members present: Dr. Harry V. Barnard, research director; and Dr. Merle Frampton, director, Study on Special Education and Rehabilitation.

Mr. Elliott. The Subcommittee on Special Education of the Committee on Education and Labor of the U.S. House of Representatives

will be in order.

The Subcommittee on Special Education is pleased to have this opportunity to visit in Cullman, Ala. I am happy to be home, and I am sure that my colleagues of our subcommittee are happy to have this chance to visit our scenic north Alabama.

We are meeting here today to receive testimony from the public on the most urgent, unmet needs in the field of rehabilitation and special education, and to hear specific suggestions as to how the Federal Government may best aid the States and local governments in at-

tempting to solve some of these problems.

Early in the 1st session of this 86th Congress, our committee was flooded with bills, more than 100 of them, seeking to get at the problems in these two fields of special education and rehabilitation. Our subcommittee, wisely, I think and I hope, decided to do a complete investigation into the whole field of these problems, as a basis for future

legislation.

We have held hearings already in New York City, New Haven, Conn., and following these hearings we will go to New Jersey next month. Soon, thereafter, we will hold hearings in Portland, Oreg., and perhaps in California, in an effort to get a complete coverage of the viewpoints, and particularly the recommendations for improvements to be made by people who work in this field and people who observe the operations of existing laws.

We do invite several hundred persons who are interested in these fields to each of our hearings, and usually it turns out that we have

50 or 60 witnesses who appear to testify.

In these hearings here in Cullman, Ala., today and tomorrow, we expect to have about 60 witnesses, all of whom have notified us of

their desire to testify. Some of these witnesses are here now and

others are on the way.

These witnesses will come here from the 14 Southern States, from Alabama, Arkansas, Florida, Georgia, Kentucky, Louisiana, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas,

Virginia, and West Virginia.

At this time I have the privilege of introducing to you the members of our Subcommittee on Special Education. On my right is Mrs. Edith Green, a Member of Congress from the State of Oregon, from the fine city of Portland, Oreg. Mrs. Green and I have served on the Committee on Special Education for several years now. I have had the fine privilege of working with her on many items of legislation.

The one that I like to think of particularly at this time is the National Defense Education Act which came from our committee. Under the National Defense Education Act today, 1,400 Alabama boys and girls are going to college with loans provided by that bill. About 101,000 are going to college in the Nation under loans provided by

that bill. That is only 1 of the 10 sections of the bill.

On the right of Mrs. Green is Judge Dominick V. Daniels, a Member of Congress from the State of New Jersey. He came to Congress in this 86th Congress and has served on our subcommittee since he came to Congress. He was an outstanding judge before he came to Congress. I am sure I bespeak the sentiments of everybody here and all those who will be with us when I say that we welcome Judge Daniels and Mrs. Green to Cullman, Ala.

On the right of Judge Daniels is Congressman Robert N. Giaimo. Congressman Giaimo is likewise a Democrat, a Member of Congress from the State of Connecticut. He lives in the city of New Haven, Conn. We held hearings in his city in mid-December of this past

vear.

Another member of our subcommittee who will be here shortly, and who at this moment is entering the door, whom we are very happy to have after the experience of failing to get the plane that he was orig-

inally scheduled on, is Congressman Quie.

Congressman Quie is a member of the Republican Party, a Member of Congress from the State of Minnesota. He comes to join us for these 2 days of hearings on this subject matter that he and all our fellow subcommitteemen here are deeply interested in.

We truly hope that out of these hearings we may be able to develop

a law that will be highly benefificial and useful.

Now I want to recognize the mayor of the city of Cullman, Ala., who has been very helpful to the members of the subcommittee in arranging these hearings, and who has cooperated with us and worked with us to the end of getting these hearings underway.

I recognize and introduce now the mayor of Cullman, Ala., Mayor

J.W. Arnold, to say anything that he might care to say.

STATEMENT OF HON. J. W. ARNOLD, MAYOR, CITY OF CULLMAN, ALA.

Mr. Arnold. Mr. Chairman and members of the congressional delegation, it is indeed a privilege to have you visit our city. I want to extend a welcome to you.

We are a county of 50,000 friendly folks and business people. One thing that makes Cullman unique is that we have 7,000 individually owned farms. I think that is a record of any county in the United States. Most of these farms are owned by the individual people. They are thrifty people, a cross between the German immigrants and the Georgia, Mississippi, Louisiana, and Tennessee people who came into our county.

It is a privilege to have you people here to join in this hearing. I want to thank Congressman Elliott for bringing the hearing to Cullman. While you are here, we want you to make yourselves at home.

Any way that I can be of assistance to you, please call on me.

Again I want to say how much I appreciate the honor of you folks coming to Cullman.

Mr. Elliott. Thank you very much, Mayor Arnold.

Another one of my fellow farmers that I have the privilege to thank at this time for what he has done to help us get this hearing underway is the judge of this judicial circuit, Judge Kenneth A. Griffith.

Judge Kenneth Griffith has cooperated with us in getting these hearings arranged for Cullman, Ala. His cooperation has gone to the point of relinquishing to us today his courtroom after he had already scheduled a court hearing. Because of his cooperation, I want to express the thanks of this committee.

The judge is in our audience now. I will ask him if he cares to

say a word to our visiting friends from the committee.

STATEMENT OF HON. KENNETH GRIFFITH, JUDGE, 32D JUDICIAL CIRCUIT, CULLMAN, ALA.

Mr. Griffith. Mr. Chairman and members of the committee and their attachés, the visitors we will have with us these next 2 days, I take pleasure and it is a real privilege to have the opportunity to thank you for this meeting here in our midst. We are indeed proud to have you.

I know, Congressman Elliott, that you have some small inkling or idea of the high regard that the congressional district that you represent has for you, and more particularly the people of Cullman

County. They hold you in high regard.

I say that unhesitatingly to your colleagues here. You have served faithfully and worked hard for the people of this congressional dis-

trict and they appreciate it.

I know that the thing that brings this committee here today is a labor of love, because a nation that can produce Representatives that have the humanitarian touch in their heart that these committee members must have, as evidenced by their taking time out to go all over this Nation to inquire into the needs of the unfortunate people whom nature has marked, and try and help them help themselves, it must be a source of satisfaction to you in this kind of work.

Knowing you, Congressman Elliott, as I do, I know it must be a source of satisfaction to you to help these people help themselves.

While I was probate judge and ex officio juvenile judge of this county for some years, I know that I have worked with you in the field of educating our younger people to make better citizens of themselves. In that position I found that the field is great, it is broad,

and there has to be a lot of work done to straighten out and put these

young people on the right path.

As for the afflicted, we can do no more for them than to see that they get an opportunity to compete with their fellow men in earning a living, being self-supporting. You can bring gladness to their hearts that way more than any other way that I know of.

The mayor said that we are a county of 50,000. I think the mayor is thinking about the last census. I think this census this year will give us around 60,000 people. Certainly the city has grown rapidly

in the last 10 years.

We are mighty proud to have you here. The latchstring is on the outside to you. We want you to enjoy yourselves while you are here. Thank you.

Mr. Ĕlliott. Thank you very much, Judge Griffith, for those kind

and encouraging remarks.

Now, my friends, we will proceed to call our witnesses, but before we do that I want to acknowledge the presence here this morning of Dr. Merle Frampton. Dr. Frampton is the director of a special study in this field that is being carried on under the auspices of our committee. He comes directly here this morning from Atlanta, Ga., where he has been holding a workshop for the past 2 days, and from which workshop there will arrive here in Cullman this afternoon 20 or 25 people who will testify as to the conclusions and recommendations that the workshop evolved in its studies.

We are happy to have you, Dr. Frampton.

Present also are members of our staff who work with us. I speak now of Dr. Harry V. Barnard, who will assist the committee and be of assistance to the witnesses in any way possible. He is the research director for our subcommittee. Here also I want to particularly bespeak the thanks of the subcommittee to Bill Jones of my hometown of Jasper, Ala., Floyd Lawson of Decatur, and Carroll Eddins of Cullman, who have worked with us faithfully for the past several weeks in the days of preparation for these hearings. These three gentlemen are present here today.

If anyone has any business with the subcommittee that we cannot transact right at this time, or if the press or radio people want to contact us, Mr. Jones and Mr. Eddins are here in the courtroom now

and will be happy to serve in any way they can.

Our first witness today is Mr. Paul Roy Brown of Jasper, Ala. Mr. Brown is a former superintendent of education of Walker County, the county immediately to the west of us. He has also served as a rehabilitation officer for the counties of Walker, Winston, and Marion in this Seventh Congressional District of Alabama. He is now principal of the Townley Junior High School at Townley, Ala. He, through long training and experience as a classroom teacher, as the principal of a junior high school, as county superintendent of education, and as a skilled, efficient, and dedicated workman in the vineyard of rehabilitation, is highly qualified to bring testimony to us at this time. I am happy to welcome my longtime friend, Mr. Brown.

STATEMENT OF PAUL ROY BROWN, JASPER, ALA.

Mr. Brown. Thank you, Congressman Elliott. I believe you have omitted the most important person in this house in your introductions, Congressman, one person, your wife.

What about that? I am sure the people would like to see her.

Mr. Elliott. I will ask my wife, Jane, to stand.

I think I also failed to introduce my secretary, Mrs. Cora Marlowe, who has volunteered to work with our subcommittee during these hearings, because of the absence of Miss Mary Allen, the clerk of our

subcommittee, who has been sick for the past few weeks.

Mr. Brown. Mr. Chairman and members of your committee, I am deeply grateful for the opportunity of testifying to some of our needs in the field of special education in our area. But before discussing a few points briefly, I should like to say that we are honored in that you are holding this hearing in this particular geographic location of our great Nation. We indeed welcome you.

Having served as a classroom teacher, principal, county superintendent of education in the neighboring county of Walker, and also as a vocational rehabilitation counselor, I feel that I might present to you briefly, as I see it, some of the needs in special education and

rehabilitation.

First, there is a large backlog of rehabilitation cases who could achieve independent living through liberalized rehabilitation services. This would minimize the home and institutional responsibility. would add dignity and economic security to the home and the com-

munity.

We are reaching a very few borderline cases. In the total field of special education and rehabilitation, a small percentage of the handicapped is being reached due to the following reasons: Not enough specialized teachers to meet the needs in these fields; too few teachers are being trained; sheltered workshops, diagnostic centers, and evaluation centers are limited and inadequate.

I am aware of the fact that in the last few years many of the phases in rehabilitation and special education have been improved to some extent. But in order to meet the needs more adequately, it is imperative that these services be broadened. I understand that out of your committee came the National Defense Education Act, which is prov-

ing to be a wonderful aid in educating our youth.

I hope that you will be able to formulate a bill for special edu-

cation and rehabilitation that will be as effective.

Mr. Chairman, that is the gist of what I have to say. I believe you told me that you would like to ask me some questions concerning this field.

Mr. Elliott. Mr. Brown, you served in the rehabilitation phase and have served in education for many years. Do I understand you to say that you feel that primarily the shortage in the field of special education, the field of educating people who have disabling handicaps, is in facilities and teachers? I believe that is the statement you made.

Mr. Brown. I think that is one of the greatest needs, Mr. Elliott, that we have today-facilities, places to do something with these people when they present themselves for rehabilitation services, and trained people to work with them. Those two things are the most needed things, I believe.

Mr. Elliott. That is true in rehabilitation and true in education

as well, is it not, both phases of it?

Mr. Brown. That is right. I think that the bill, the education bill, that has just been passed for aiding boys and girls to attend college

is doing a great deal, and within 5 years I believe you will see a lot of

benefit come from that in our schools.

You will not have a statement from each State saying that your school is on probation because this person has been shifted over to the other field, from social science to chemistry, or something like that. You realize what would happen in a case of that kind, putting

a person from social science into chemistry.

Mr. Elliott. I gather from your testimony that you feel there is a great group of people that are not reached by the present rehabilitation laws because they are limited to rehabilitating people for full-time employment; that beyond that, in the twilight zone beyond that, is a large number of people who can be rehabilitated for what we might call independent living so as to free the institutions of the expense, in many instances, of care that goes with their program as we presently have it.

Mr. Brown. Yes, Congressman. In a lot of cases when I served as rehabilitation counselor, we would encounter a patient, a client, and we could not serve him because of that fact. The home was involved

and we could not work it out.

So I think that independent living, a law passed that would liberalize rehabilitation to where we could take in those cases, and to give an overall rehabilitation service to the family in order to make it possible to rehabilitate service to the family in order to make it pos-

sible to rehabilitate that person, is needed.

I will say that I do not believe there are very many people who are beyond some type of rehabilitation. I think there are very few because they can be rehabilitated mentally or they can be rehabilitated physically or from a vocational standpoint. There is some phase of it that they can be rehabilitated in.

Mr. Elliott. I have heard it expressed in the last day or two that probably we are not reaching, because of the limitations of our present law, more than perhaps 25 percent of the handicapped people who

could profit by rehabilitation services.

Mr. Brown. Did you say we are not reaching 25 percent?

Mr. Elliott. We are not reaching more than 25 percent of the total

who can profit.

Mr. Brown. I see a number of my friends here, rehabilitation counselors, who have had a lot of experience, but I think if we were to say we were reaching 25 percent I think they would challenge me on that.

There is one thing I would like to bring out, Congressman. We have been involved with rehabilitation in this light. We have to have—they do not tell us so, but we know that a rehabilitation counselor needs 80, 90, 100, or 120 rehabilitations a year to make it look

good on paper.

When a rehabilitation counselor works with 100 people he is limited in the service that he can render that patient. There is a great deal more, such as writing up a report and assigning him to some particular place for training. There has to be a lot of counseling and guidance with working with his client to see how he is getting along. I think that our rehabilitation counselors are running into that.

That is what I ran into when I served Walker, Winston, and Marion Counties. It was just so big until you did not have time to work with

all these people, the clients.

Mr. Elliott. You had more clients, so to speak, than you had time, did you not?

Mr. Brown. Yes. I doubt if we served over 2 or 3 percent of them,

or something like that. That would be my honest opinion.

That seems mighty small, but I am putting it down to bedrock now. It was 3 or 4 percent, those that we could actually serve. Then there is a field, a multitude of people in this country, who have never heard of rehabilitation. They do not know about it. They are due it; they ought to have it. But it has not reached them yet.

As a matter of fact, we need more publicity. We are getting a lot of publicity, but even if they were to come in we could not do anything about it, because we have more than we can do anything with.

We talked a lot about referral. We would get up 300 or 400 referrals and put them in a card index. We are in such a rat race, if you will excuse that expression, that we never have any time to get back to the referrals. These that are before us, those are the ones we are working with. We need more rehabilitation counselors, more specialized teachers. The whole program of rehabilitation, I think, needs to be enlarged.

We are our brother's keeper. I do not believe anybody lives to himself or dies to himself. I think it is a wonderful thing for this committee to be here to look into the whole problem of special edu-

cation and rehabilitation.

I think it is just in its infancy. I can visualize in years to come when rehabilitation will be so effective that you can see a great deal of differences in our local communities, our towns, and our homes, the effects of it.

Mr. Elliott. Thank you very much, Mr. Brown. Are there questions of the witness? Mrs. Green?

Mrs. Green. I do not have any questions.

Mr. Elliott. Mr. Quie?

Mr. Quie. I would like to ask one question, if I may.

Do you have a school or do you have training facilities in Alabama for the teachers of the deaf or for speech pathologists?

Mr. Brown. Yes, we have some places that offer this teaching, this

education.

Mr. Quie. In Walker County, how many of your schools have a teacher for, we will say, the deaf or the speech handicapped? None whatsoever?

Mr. Brown. We have what is called special education teachers from the schools that take the retarded children. But actually specialized

teaching in that field we do not have.

Mr. Quie. Do you have one resident school for the deaf in the State?

Mr. Brown. In the State?

Mr. Quie. Yes.

Mr. Brown. Yes, we have one.

Mr. Quie. That is all I had.

Mr. Brown. Thank you very much. Mr. Elliott. Thank you, Mr. Brown.

Our next witness this morning is Dr. Robert C. Berson, vice president of the University of Alabama, in charge of the university's medical center at Birmingham, Ala.

STATEMENT OF DR. ROBERT C. BERSON, VICE PRESIDENT, UNIVERSITY OF ALABAMA MEDICAL CENTER, BIRMINGHAM, ALA.

Dr. Berson. Thank you, Mr. Chairman.

Mr. Elliotr. We are happy to have you, Dr. Berson. You may proceed in any manner that you desire. The only limitation I have to impose is that with the number of witnesses we have we will be limited to about 10 minutes per witness. But if you have a statement in writing you can incorporate that into the record in full after you have made your statement.

With that, you may proceed.

Dr. Berson. Thank you, Mr. Chairman.

Actually, I am deeply interested in the proposal of House Joint Resolution 494 for training of teachers of the deaf, speech pathologists, and audiologists, but I think you are going to hear from people in the next day or two who have more specialized knowledge in that field than I do.

The medical center tries to run a hearing and a speech clinic, so we have some firsthand knowledge of the shortage of trained people in this field. But I would like to address most of my remarks to the independent living provisions of H.R. 3465, and mostly to make two

points about it.

It would be very difficult to overemphasize the importance that I attach to this measure if it is adopted. One of the points is the tremendous need for realistic support for programs of expert evaluation. Of course, my perspective is that of a specialized teaching

hospital and its clinics.

Actually, when you first try to evaluate any severely handicapped persons, it is very difficult to be certain what are reasonable goals for the rehabilitation of that person until you have gone into the matter pretty carefully from the usual aspects of the counselor or the social worker, the psychologist, the specialists in several medical fields.

Sometimes the determination of realistic goals falls short of being fully employed in the usual sense. But that does not mean that the goals are not worthwhile, because the difference between being totally dependent and having to have a full-time attendant for everything, or being able to look after yourself, is a tremendously important the control of the community.

tant thing to the individual, his family, and the community.

The saving in money that is accomplished when one person can be so improved that he no longer needs to be in an institution or no longer needs a full-time attendant, whether this is a paid individual or a member of the family, is a tremendous saving, because it is one that goes on month after month and year after year.

At the present time in the medical center we are in the early stages of planning an expanded rehabilitation program and facility, and this problem of the program being adequate to support the evaluation

of patients is a difficult one until it finds some solution.

When we develop the program we expect, it will only be reasonable for severely handicapped people from all over the State to be sent there for evaluation and such treatment as should be given centrally. But for a great many of those people, it wouldn't be realistic to say that they can be so far rehabilitated that they can be fully employed. So to go back to the beginning, it would be difficult to overemphasize the importance that I attach to this measure for the benefit of all the handicapped people and the people who are trying to help them.

Mr. Elliott. Thank you, Dr. Berson.

Let me ask you one question: Do you train speech therapists at the

university medical school?

Dr. Berson. No, not in the medical center. I think perhaps some of the people from the main campus will be testifying later, and they can tell you in far more detail of their training program for teachers. But in the medical center we do not. We employ some. We have to have them.

Mr. Elliott. You do not train what we call audiologists either, do

vou?

Dr. Berson. No. We have to have them, too, but we do not train them ourselves.

Mr. Elliott. Are there any questions of Dr. Berson?

Mrs. Green?

Mrs. Green. No questions now, Mr. Chairman.

Mr. Еглотт. Judge Daniels?

Mr. Daniels. No questions. Mr. Elliott. Mr. Giaimo?

Mr. Giaimo. No questions. Mr. Elliott. Mr. Quie? Mr. Quie. No questions.

Mr. Elliott. Thank you very much for your testimony, Dr. Berson. It will be very helpful and we appreciate it.

Our next witness this morning is Mrs. Ethel Gorman, of the Social

Hygiene & Mental Health Association, Birmingham, Ala.

We are happy to have you, Mrs. Gorman. You may submit your statement for the record, if you desire, and summarize it, or submit it in any fashion that you desire.

STATEMENT OF MRS. ETHEL GORMAN, SOCIAL HYGIENE & MENTAL HEALTH ASSOCIATION, BIRMINGHAM, ALA.

Mrs. Gorman. Thank you. Mr. Elliott and members of the committee, I am going to discuss a different type of handicap than most

of the people here.

Delinquency is a handicap which is often more devastating in its effects than physical or even mental handicaps, because it involves not only the individual and his family, but society as well. Because so little is known scientifically about behavior in general, and delinquent behavior in particular, rehabilitation efforts have largely failed.

Because of the irritating nature of this handicap, and because the rising rate of delinquency proclaims to all the world our failure to solve the problem, we react with anger. Instead of seeing the socially, emotionally, often mentally and sometimes physically handicapped individual, we are blinded by the glare of his melodramatic actions. His behavior is his handicap. His need for rehabilitation is not his need alone. It is the Nation's.

We think nothing of spending vast sums to try to put man on the moon, but if he doesn't learn how to get along with his fellow man any better than he has in the past, are we not merely enlarging the

territory for fear and unhappiness?

If comparable amounts of money were spent to learn how to modify human relationships—of which delinquency represents one of the most serious failures—think of the possible gains in happiness, security, and peace

The goal of any rehabilitation program for delinquents is to modify behavior. Now, behavior is learned. Psychologists tell us that after a certain response to a stimulus has been established, it will take at least as long—and usually longer—to substitute a different response

or behavior

So we cannot hope for a sort of 3-minute child wash, where we can run through our delinquents and bring them out clean. Delinquents did not become antisocial overnight. They will not learn more acceptable behavior through quick "cures" like curfew laws, parent responsbility laws, more recreation, slum clearance, and the like. They will learn different behavior—if at all—by a slow, painstaking relearning process.

If we take a blank piece of paper and crease it repeatedly in a crooked line, the crease becomes a habit of the paper, as it were, and

the crooked line the habitual position of the paper.

To increase the paper so that the creased line is straight across the page requires even more effort than it took to fold the paper crooked. And some trace of the crooked line will continue to mar the page. But the line can be changed and that is the important point in the analogy to a child's delinquent behavior.

In Alabama there is no opportunity for a delinquent child to be taught new behavior on any consistent basis except perhaps at the Alabama Boy's Industrial School, the State Training Schools for Girls, in Birmingham, and the Alabama Industrial School for Negro

Children at Mount Meigs.

However, their budgets are so low that they cannot take all the children who could profit from commitment, and at the Alabama Boy's Industrial School the constant pressure of new cases forces the release of many boys before they are ready or when they must return to homes which are so unsuitable that they tear down all the new behavior the children learned during their 8 or 9 months of discipline. The rate of recidivism has increased in the last 5 years from 11 to 23 percent.

The training schools are now getting the most confirmed delinquents, and those are the hardest to change. Knowing about the shortage of space, committing courts have a tendency to wait until the child's position is critical before sending him. This may have a bearing on

the recidivism rate.

Still another influence may be the fact that the average IQ rate at the school is between 75 and 80, which is far below the norm of 100, and a parolee under 16 years, and most are 15, has no alternative but to return to a schoolroom which offers only abstract learning, academics beyond the boy's ability and usually association with children younger and smaller than he is.

His feeling of frustration and inferiority overwhelms him and in anger he strikes back blindly at society, first in truancy, then often by running away, stealing, or assault. So the State's investment in his training is lost. Once more the public yells "Get tough," behaving toward him, the delinquent, exactly as he has behaved toward the public and for the same reasons: bewilderment, frustration, anxiety,

inadequancy, and the resultant anger.

But suppose that, upon release, those boys who are uninterested in or incapable of academic work had a place to go where they could receive job training. Mr. J. S. Hill, superintendent of ABIS, stated that 100 percent of the institution's population could profit from some type of job training. Perhaps only about 20 percent could learn such highly skilled vocations as automobile mechanics, printing, and the like.

The majority of the boys—75 percent—could learn such trades as painting, paperhanging, bricklaying, and similar occupations which require manual dexterity and concrete, rather than abstract, learning. Even the very slow children—5 percent—could learn simple, routine jobs and the habits and attitudes which would give them some possibility of graduating into paid helpers on farms or on assembly lines.

Experts on mental illness emphasize the fact that the inmate of an institution is taught to adjust to institutional life, rather than to community life. Upon his release, he is convalescent, just as a patient is who has been hospitalized for physical illness; the difference being that the family and community has in the past expected the mentally ill person to come out of an institution fully "cured" and able to fit immediately into the pressures and demands of daily community life.

This country has been building halfway houses in order to provide a stepping stone from the institutional life to community life, in order to let the patient learn community skills and practice them

again.

The same concept seems valid for the delinquent. He, too, in a "reform," industrial, training or whatever-you-choose-to-call-it school, learns to adjust to institutional living, which is quite different from community living. I submit that the same concept of a halfway house for delinquents would be a valid step toward easing them through the critical postinstitutional period. This is the time when most recidivism occurs.

So, then, if there were a residential facility with group therapy or counseling, casework service and job training, we might see a significant reverse in the present trend toward increasing recidivism.

But such a facility need not be limited to parolees. There are many boys known to juvenile court who could be placed directly in such a facility without the necessity for commitment to ABIS, or who could remain in their own homes while participating in the work training and counseling program on an outpatient basis. Such a facility would decrease the pressure on the State correctional institution, perhaps enabling it to do more thorough and successful work with the children they receive.

A study of the incidence of delinquency in Jefferson County during a 5-year period from 1952 to 1957 revealed a case increase of 40.59 percent, while the juvenile population increased only 16.54 percent. The most marked rise occurred in the case of Negro males, which

went up 57.25 percent during the period.

Approximately 75 percent of the children were between 12 and 15 years old. The percentage of increase in the number of repeaters

rose from 32.8 among white children in 1952 to 39.9 in 1958, and from 39.8 among Negro children in 1952 to 43.5 in 1958. Clearly, the tide of recidivism is rising and at the moment overburdened probation officers cannot stop it. Clearly, something new must be tried.

The public school is not meeting the needs of delinquent children, or even of those handicapped in a less alarming way. Birmingham and Jefferson County probably have more special classes than other parts of the State, but in Birmingham there are 300 children on the waiting list for a special class and only 448 so placed. Of these classes, only two true junior vocational classes are offered, although there are some scattered vocational courses in several high schools.

are some scattered vocationar courses in several right schools. Since 20 percent of Birmingham and Jefferson County's school population of 121,278 have IQ's in the 73–91 range, we can estimate that 6,063 children in this area fall into the group of slow learners which makes up the bulk of the present delinquency population. No attempt is made to offer special education or attention to the so-called borderline children, who are not retarded enough to be eligible for the

special classes, or for the delinquent child.

The public has been slow to recognize that it has as much responsibility to train and rehabilitate the child with a behavior disorder as it does any other handicapped child. School personnel often reject the responsibility because they think it belongs to the home; the home has usually rejected the responsibility before the child got to school.

Therefore, we must consider not so much whose responsibility it is as who will assume it, because somebody must. We must not put ourselves into the self-excusing category of a father in our county who complained bitterly after his fourth son got into trouble: "They just raise kids different nowadays." "They," he said.

The Vocational Rehabilitation Service seems most suited of all existing agencies to assume the responsibility for job training of delinquents. I therefore propose that the law governing the categories of handicapped people that this agency may service be amended to

include those with behavior handicaps.

I further propose that funds be made available for a 3-year pilot research and demonstration project, to be located in Birmingham, Ala., to determine the effect of a residential work training and counseling facility upon the rate of delinquency recidivism in the area.

Mr. Elliott. Thank you very much. Are there questions of Mrs. Gorman?

Mrs. Green. Mr. Chairman, first of all I think she would make a

superb witness for other legislation also before the committee.

I take it from your testimony that you are suggesting that some of those who are mentally retarded and have other handicaps are more

likely to become delinquents?

Mrs. Gorman. It is the borderline group, I believe. It is in our county. I know there are some national studies that say that is not true, but in our county we find that they are between 73 and 91, the majority of delinquents. That is borderline. It is slow, but not retarded.

Mrs. Green. Between 73 and 91 percent of the delinquents?

Mrs. Gorman. No; the IQ. Mrs. Green. The 73 to 91 IQ?

Mrs. Gorman. The majority of delinquents are in that IQ range.

Mrs. Green. Are there any authoritative studies in Alabama that would show the percentage of the mentally handicapped or the low IQ's who become delinquents in comparison to the population as a whole?

Mrs. Gorman. I do not believe there are any authoritative ones. I base it on the boy's industrial school average. Of course, they get commitments from all over the State. The average IQ of the boys committed there, and they test all the boys there, is between 75 and 80. That comes from the school.

Then at juvenile court there is no actual scientific research which has been given to the subject. I suppose it really would be guesswork. But just from observation you know that the majority of

children are in the borderline group.

Mrs. Green. Perhaps a future witness should be asked this question, but some time ago in the paper I read a report that a very large percentage of those who were handicapped as far as hearing was concerned had been automatically classified as mentally retarded, and further tests showed that it was not a mental retardation but, rather, a partial deafness.

Do you know of any such studies?

Mrs. Gorman. No. I know it happens, but I do not know of any study in Alabama.

Mrs. Green. That is all, Mr. Chairman. Thank you.

Mr. Elliott. Are there any other questions of this witness?

Mr. Daniels. Mrs. Gorman, you suggested a halfway house for these delinquent children. Could you give us some more specific

details of your recommendation?

Mrs. Gorman. Yes. I would suggest it would be more permissive than a training school. It would be set up, I should think, a little bit on the order of the Hifelds plan, only I think not in the country, but in the city. I know a lot of people think that the CC camp idea would be better. But personally, I think they have to learn how to live in the city if they are city boys.

I would suggest that they would live in a home with house parents and with casework service available. I would think some sort of group therapy would occur, which would take a trained person to do, in the The job training would come in the daytime, I should think, and the group therapy at night. Then I would like to see them

placed on jobs eventually.

Mr. Daniels. Would you detach a delinquent boy from his family

and send him to a foster home? Is that your thought?

Mrs. Gorman. I was getting away from the foster home idea, because I do not think most delinquents can accept the foster home and certainly very few foster homes will accept a delinquent, or a teenager. Most foster parents would take smaller children and are not interested in delinquents.

I think delinquents and most adolescents get along better in a group, anyway, with their peers. I think they would accept being away from home in a group better than they would accept a foster

parent.

Mr. Daniels. That is all. Thank you.
Mr. Giaimo. These recommendations that you make in order to seek a solution to this problem of delinquency, do you feel that it can only be accomplished if there is Federal participation?

Mrs. Gorman. Well, of course, if Vocational Rehabilitation comes in on it, the law would have to be amended, because at the present time they cannot accept a delinquent unless he is disturbed mentally or retarded.

Mr. Giaimo. I am talking about the delinquent. You are suggesting an amendment to the law to include the delinquent. My question. to you is: Is there a necessity of Federal participation in this field of the delinquent or should this problem be handled at the State level?

Mrs. Gorman. Well, that remains to be seen about the money, I suppose. I am in the process now, or we are in Jefferson County, of organizing a citizens committee. It has been organized and it is attempting such a program. However, I do not know whether the money will be forthcoming.

Unless we had somebody to teach for the job training part of it, it would be lost anyway. It seems to me that the vocational rehabilitation people already are skilled in that particular area. I am sure they would need more workers assigned if they are going to take that on, too, but they would be the natural people to carry forward such a program, I should think.

Mr. Giaimo. Thank you. Mr. Elliott. Mr. Quie?

Mr. Quie. Have you tried or are you using the visiting teacher in Birmingham?

Mrs. Gorman. Yes; we have visiting teachers.

Mr. Quie. How is that working? Has it cut down the juvenile

delinquency, the use of the visiting teacher?

Mrs. Gorman. Well, I do not know that it has. Facetiously, it adds to the burden at juvenile court because about, I should say, 40 percent of the children brought in are for truancy. Well, maybe not that high, but a large percentage of the children brought to juvenile court are for truancy. I know I used to see children brought in for truancy, I would have them tested, and they would turn out to be quite retarded or they would turn out to be borderline children who could not keep up with the schoolwork.

Are you going to say a person is delinquent because he does not want to go someplace where he does not understand what is going on? I guess it is yes and no. They probably keep some out, but I do not

know.

Mr. Quie. Then I gather that the biggest problem causing the delinquency is the retardation and the people in rehabilitation would be more qualified to handle that than the visiting teacher, just changing the social arrangement in the family?

Mrs. Gorman. Much more. The idea of job training, I think, is important. So many of these children who go into schoolrooms have never been able to learn. Even when they have a normal mentality,

most delinquents have reading problems.

It seems that they have concrete learning ability, but not abstract learning ability. I do not know why this is. Perhaps that is one thing that needs some research.

Mr. Quie. Thank you.

Mr. Elliott. Thank you very much, Mrs. Gorman.

I have a statement from Alabama's senior U.S. Senator, Lister Hill, together with a letter addressed to me under date of January 25, 1960, expressing his regrets on being unable to appear before this subcommittee today, and forwarding a statement on the matters now pending before this subcommittee.

The statement of Senator Lister Hill will be made a part of the

record at this point.

I also have a telegram dated January 26, yesterday, from Alabama's Senator John Sparkman, which states:

Wish very much I could be with you at the hearings relating to the handicapped. You, your subcommittee, Dr. Frampton, and other expert witnesses are to be commended most warmly for your interest in and your efforts to be helpful to those unfortunate groups. Their handicaps, though, need not be completely incapacitating. Many can be rehabilitated to useful and independent living with proper care and attention.

For many years I have worked for legislation and other measures designed to benefit our disabled children and adults. I served on the President's Committee To Employ Physically Handicapped, so my interest is of long standing. We owe these citizens a chance to overcome their difficulties and to make the fullest

contribution possible to society and to the welfare of the Nation.

I pledge you my full cooperation to this end.

John Sparkman, U.S. Senator.

(Senator Hill's statement follows:)

STATEMENT BY HON, LISTER HILL, U.S. SENATOR FROM ALABAMA

Mr. Chairman and members of the subcommittee, it was with the greatest pleasure and deepest interest that I received your kind invitation to submit this statement to the Subcommittee on Special Education of the Committee on Education and Labor in the course of its study on special education and rehabilitation.

Before offering specific comments, I should like to express my gratitude to the chairman and to the subcommittee for what I consider an excellent contribution to the whole field of study of special education and rehabilitation. I refer to a compilation of Federal resources and services in these fields which will soon be published by this subcommittee. This will be the first time that we will have in one volume an inventory of all Federal agencies that deal with these matters—and a listing of the services each provides. This inventory will be of great assistance to all Members of the Congress as we consider ways and means of improving special education and rehabilitation with a minimum of duplication.

I should like also to compliment the entire subcommittee on the way it has gone about its business of studying its assigned fields. The subcommittee is following a practice that I consider to be in the highest tradition of our democracy; it is taking the problem to the Nation and gathering in all major geographic areas of the country the opinions, beliefs, facts and other information that will be of

assistance in drafting legislation in this field.

The subcommittee's sessions in Cullman are a fine example of the process of going to the people with problems that concern all the people. And I may say that no part of the country could be more appropriate than Cullman and its surrounding trade area for any study of rehabilitation.

Here is a region that has lifted itself by its own bootstraps and the wisdom and energy of its people into a model of progress for most sections of the South

and of the whole Nation.

To me, one of the outstanding programs of service to our people consists of the program of vocational rehabilitation of disabled people. I have watched with the greatest gratification as this program has progressed in most of the States throughout the Nation. It was a pleasure for me to lend my active support to the enactment of a new vocational rehabilitation law in 1954 that has enabled the States and the Federal partner in this cooperative endeavor to accomplish, if not miracles, at least wonders of progress.

I have seen four major bottlenecks that hampered and slowed rehabilitation in the States, if not completely broken at least opened to the point where the hindrances to progress have been minimized. Both the States and the Federal Government have more than doubled their contributions since 1954, thus remoring the drag of an insufficiency of vital financial support. The total State moneys devoted to rehabilitation this year exceed \$31 million as against \$13.8 million

in 1954. Meanwhile the total Federal funds, most of them for the support of State programs, have risen from \$23 million in 1954 to \$64.6 million for the current fiscal year. As chairman of the Senate Appropriations Subcommittee having jurisdiction over the rehabilitation appropriations, I have taken great satisfaction in insisting on adequate funds for this vital program. You may be sure that in the future I will continue my efforts to increase Federal funds available for this important work.

During this period I have seen the number rehabilitated so that they may secure employment advance from about 55,000 in 1954 to 81,000 during the past fiscal year, and the number of individuals receiving rehabilitative services that ultimately will restore them to independence increased from about 200,000 in

1954 to more than 300,000 during the fiscal year just past.

Secondly, there has been well opened the bottleneck of inadequate trained

personnel to carry on the expanding nationwide program.

This forward stride is being accomplished under a program of training grants for which authority was incorporated into the 1954 legislation. During the past fiscal year the Office of Vocational Rehabilitation made 197 grants to colleges and universities for the training of more than 1,000 skilled professional workers who can handle the intricate jobs of advising and counseling disabled men and women and youth, of handling their psychological, medical, and vocational problems—so that they may become independent, self-supporting, contributing citizens.

A third bottleneck that is being opened under the vigorous administration of research authority is that of inadequate knowledge of advanced techniques, of problems of employment and of better methods of handling various severe disabilities so that their victims too can make their comeback. There were more than 200 projects of this nature underway last year and 42 of these were selected demonstration projects in areas of severe disability—projects in which newly won information gained through research is being given practical application in meeting the problems of disabled people in all parts of the country.

Fourth among the bottlenecks was a shortage of facilities. This is being met head on, both through the provisions of the vocational rehabilitation law and through an extension of the Hill-Burton survey and construction program. Under the Vocational Rehabilitation Act's provisions, 94 rehabilitation facilities, sheltered workshops, and visual aid centers were established or substantially improved last year, while under the Hill-Burton program, 114 comprehensive re-

habilitation facilities had been approved through 1959.

From the foregoing, it is obvious that the entire vocational rehabilitation program has been making commendable progress, both at the Federal and the State

levels.

We have now come to the point where existing rehabilitation legislation does not meet the complete needs of our Nation. One of the more glaring shortcomings of our existing rehabilitation program is that, worthy as it is, we stop now with help for those who seek help only for the purpose of obtaining work. This is the program that I have extolled on many occasions, as I have done in this statement. But we should not stop with rehabilitation to employment.

There are literally hundreds of thousands of disabled people in our country who can return to self-reliance through rehabilitation services even though they may not have bright or immediate prospects of employment. These people

cannot be served under existing rehabilitation laws.

There is a great need for us to widen the scope of existing programs in order to make it possible for such people to receive rehabilitation services that will enable them to achieve the fullest possible measure of independence, whether this be in meeting the activities of daily living or in working at a job as well.

It is an established fact that disability and disease are major causes of dependency and thus are a drain upon our economy. Prolonged disability wipes out family income and savings and sometimes forces families to break apart, destroys essential work skills, brings on public assistance and institutional care with its burdens on the public and their lack of satisfactions for those forced to accept such aid or care. Meanwhile the Nation's productivity suffers and, worse, our people thus afflicted are bereft of their pride, dignity, and joy of being self-sustaining citizens.

To substitute positive remedies for these defects in our national health pattern, I have introduced in the Senate a bill that, when enacted, will provide rehabilitation services for independent living. A long list of distinguished col-

leagues have joined with me in sponsoring this legislation—S. 772.

It is with greatest gratification that I call to your attention the fact that Chairman Elliott has introduced an identical bill in the House—H.R. 3465.

I shall not detail the provisions of the bill since they have been incorporated in the report through a previous hearing and workshop of the subcommittee, but

I should like to state generally what these bills would accomplish.

The bills first would assure the use of all Federal moneys appropriated for extension and improvement of the State programs of vocational rehabilitation, whereas some Sates today fail to use this money while other States could effect profitable improvements if they had more funds. So the bills permit the transfer of unused money from one State to another that needs and has use for it.

Secondly, the bills would provide for appropriations and give authority for the rehabilitation of disabled people to independent living. This provision for rehabilitation to independent living will prove a boon to our people who, in an ever-increasing population of older people, are beset with chronic illnesses that accompany advancing years and for many others, regardless of age, who suffer disabling conditions by reason of illness or injury. It is my conviction that this is an increasingly needed service of our people and that, in the long run, it will enable many to return to work even though their present prospects seem poor. I am certain also that, in the long run, the bills will save public funds—in the cost of institutional care and other public assistance. But above and beyond all of that, I value the social and humanitarian gains that will accrue.

That provision is the core and heart of the bills and its aim would be effected

through amending the current Vocational Rehabilitation Act.

There is a mounting need for workshops and rehabilitation facilities that not only would contribute to independent living but could serve as means of partitine, limited, or other employment for many who now must remain in enforced idleness while their capabilities are dissipated through disuse. This need is much larger than the public knows and our bills make ample provision for a start toward remedying these shortcomings in our present relabilitation programs. There is plenty of leeway given for tailoring the facilities to the need. For instance, Cullman or Jasper might need a small sheltered workshop or rehabilitation center, while larger cities like Birmingham might need a much larger facility.

Of tremendous importance is the evaluation of disabled people's actual condition, their rehabilitation needs, their work potential and all the other factors that go to compose that most intricate work of God—the human being. Provision for such evaluation in all States is contained in our bills and they would apply to even the ultra-severe disabilities such as paraplegia and quadriplegia, epilepsy,

emotional illness, and all of the others.

Our bills also would make it easier for research institutions to undertake studies in rehabilitation techniques and other problems relating to disability by eliminating as a condition for receipt of a research grant the requirement that the institution defray a part of the cost. While many medical schools and other institutions might be willing to do the work essential to solving a specific problem, they might not be able to pay a portion of the cost. Since solution of these problems is pertinent to the conduct of our public rehabilitation programs, it seems a deterrent to ask them to pay for any part of research costs.

Equally pertinent to the deliberations of this subcommittee are identical bills which Mr. Elliott and I have introduced to help resolve a very serious problem affecting 30,000 deaf children of school age in the United States and the 8 million

Americans who suffer from serious speech and hearing impairments.

For purposes of identification, my bill is Senate Joint Resolution 127 and Con-

gressman Elliott's bill is House Joint Resolution 494.

The problem which affects our deaf children lies in the critical shortage of teachers specially trained to educate such afflicted children. To meet the educational needs of these children, who, of course, have the same aptitudes and intellectual potentialities as have children with normal hearing, we should be graduating 500 teachers of the deaf annually. Instead of 500, we have less than 150 in training this year. Six of the institutions accredited for the training of teachers of the deaf do not have a single student enrolled for training this year. The situation is critical and it is national in scope.

The problem adversely affecting those 8 million Americans who suffer from speech and hearing impairments of such a nature as to seriously handicap many of them in their efforts to become independent, self-supporting, taxpaying members of their communities, is an identical one. We need many more specially trained persons to diagnose and correct speech and hearing impairments and to

train and rehabilitate the afflicted.

The joint resolution would establish parallel programs in the Office of Education and in the Office of Vocational Rehabilitation which, through the grant mechanism, will, I hope, encourage a sufficient number of young people to undertake training to become teachers of the deaf, or to prepare themselves to treat and rehabilitate persons with speech and hearing impairments. The numbers of individuals involved in these programs would be relatively small and the cost, estimated to be less than \$31/2\$ million a year, would be far less than the dividends which would be paid to the Government as a result of these programs. These dividends to be gained from the development of the abilities of those affitted with speech and hearing impairments or deafness would include not only increased strength and productivity for our Nation but dividends in dollars—in the increased tax returns which would be paid by the many thousands of individuals who, as a result of these programs, would become independent rather than dependent, employed rather than unemployable, taxpayers rather than tax consumers.

In conclusion, I wish to thank Mr. Elliott and the other members of the subcommittee for this invitation to submit my statement on these matters. I certainly hope that your labors will result in beneficial legislation.

Mr. Elliott. Our next witness this morning is Mr. John C. Harmon, Jr., special assistant, Goodwill Industries of America.

May I say we are happy to have you, Mr. Harmon. You may proceed with your testimony at this point.

STATEMENT OF JOHN C. HARMON, JR., SPECIAL ASSISTANT, GOODWILL INDUSTRIES OF AMERICA, WASHINGTON, D.C.

Mr. Harmon. Thank you, Chairman Elliott and members of the committee.

As an attorney in this atmosphere, I feel like saying "Your Honor

and members of the jury."

I have a prepared statement which I shall not read, but place

into the record.

I would simply say this: that we in the operation of sheltered workshops believe that perhaps the most important thing in dealing with disability and the problems of handicaps which come from those disabilities is that of how one has a fair chance at the starting line.

We believe that starting line is at the employment office. We sympathize with the personnel director, or whoever it is, that is seeking to employ people. For example, here are five people who are interested in a job. There are two jobs available. It is obvious that one of these persons has some kind of disability. How this affects his skill, this employment officer is not sure. He has two jobs. He is very likely to fill those two jobs with the people that he thinks will be less trouble because he is thinking about the foreman that he is going to send this man out to, and the foreman is going to say, "Listen, I haven't got time to find out what this man can do."

So we believe that the sheltered workshop is the spot at which we determine not the disability, not the handicap, but the abilities that this person has.

Someone has said that many of us have numerous skills. Some of us have perhaps only one skill. If we can match that skill with the

skill of the job, then we have done the job.

Here in the South, amid the developments that have taken place in agriculture and in industry, where we have people who live with one foot on the land and one in the plant, we in Goodwill Industries are tremendously concerned about how we reach these people who are in our rural sections as well as in our cities across the country.

It is a pleasure to be here. There is much I would like to say. As you know, the best way we think for you to see the problem is to visit our Goodwill Industries across this country wherever you have an opportunity. Our people will welcome you.

Thank you.

Mr. Elliott. Thank you, Mr. Harmon.

I would like to ask you a question, Mr. Harmon: Is the Goodwill Industries idea growing very rapidly in the rural sections of the

country at the present time?

Mr. Harmon. It is growing. You see, we come at it in a very pragmatic method. We go out there and pick up material. A contributor who contributes material to the Goodwill Industries is apt to say "Just a minute. You say you have a program to serve handicapped people." So they are apt to speak to friends who do come in. Transportation has aided this.

Some of the plants are placed on the edge of a town so that they come in from distances. The Cincinnati Goodwill Industries is a good example of a regional plan to reach all the people across a wide sector of the country.

I would say that we are making some progress. But to those that are closest to it, sometimes it is most frustrating that we cannot make

more progress and quicker.

Mr. Elliott. Thank you very much, Mr. Harmon.

Are there further questions of Mr. Harmon?

Mrs. Green. No questions, Mr. Chairman, but I certainly would personally testify to the tremendous contribution the Goodwill Industries makes in my own city of Portland in this field.

Mr. Harmon. Thank you. Mr. Elliott. Thank you very much, Mr. Harmon.

(Mr. Harmon's full statement follows:)

STATEMENT OF JOHN C. HARMON, JR., SPECIAL ASSISTANT, GOODWILL INDUSTRIES OF AMERICA, WASHINGTON, D.C.

Mr. Chairman and committee members, my name is John C. Harmon, Jr. I am here representing the 25 local Goodwill Industries located across the 14 States covered by this hearing today.

I am special assistant to the executive vice president of Goodwill Industries of America, Inc., of which these Goodwill Industries are members. As a native of North Carolina, I am glad to have this opportunity of speaking on behalf of the cause of rehabilitation in the South.

It gives me great pleasure to extend on behalf of not only the Goodwill Industries located in the South, but also for the other 95 Goodwill Industries in other parts of the Nation, our deep appreciation for the interest shown by this committee in the cause of the handicapped. Especially we would commend its

chairman for his most able and dedicated leadership.

We believe the role of the sheltered workshop in the field of rehabilitation is most important. Goodwill Industries, since its beginning in 1900, has sought to minister to the needs of both the physical and spiritual in man. We serve all types and degrees of disability. There is no age limit in fact, about 15 percent of the people we serve are over 65 years of age. Because this has always been a practical program, we have tried to keep it in step with the changing needs of the local community. This calls for a comprehensive rehabilitation program in one community and a small sheltered workshop in another place. Our goal is always a job which brings the independence, self-assurance, and dignity that man deserves. A person may enter a Goodwill Industries for evaluation services as a client from another voluntary agency or from the State vocational rehabilitation agency or the Veterans' Administration. It may be training for a specific job is needed. In some cases, the disability may be so severe as to preclude normal competitive employment. But in each case, the goal is still the same—normal employment.

In the South, as elsewhere, disability has been radically affected by the tremendous strides forward in medicine and surgery, psychology and social science. We need but mention the great progress being made in the treatment of some of the disability conditions * * * cardiac surgery, mental retardation, diabetes, blindness, paraplegia, epilepsy, Parkinson's disease, and mental illness. Where persons once died, they can now live. But with it all comes a greater challenge to rehabilitation. We must aid these and others to overcome disability to live an independent, useful, self-respecting way of life. We must have the adequate treatment of the disability but there must be follow through in evaluation of abilities * * * follow through with prevocational services, with basic training to a goal wherever possible of gainful employment.

Great progress has been made by both voluntary and governmental services that these goals be reached. But, we in Goodwill Industries know we have only

just begun to meet the challenge.

We wish to point with pride to the voluntary efforts of citizens in the local community which have produced the largest group of sheltered workshops in the Nation under the slogan "Not Charity * * * but a Chance." But we know this is not enough. Right here in the South ami dsuch phenominal growth in business and industry, we have only 25 local Goodwill Industries. We salute the progress of workshops operated by other agencies. Yet, all this is not enough.

All this preferred form of voluntary effort at the local community level has not been enough. There has to be a close partnership with the agencies of

government both Federal, State, and local.

The action of the Congress in creating Public Law 565 has played a major role in the expansion and growth of Goodwill Industries. This has been especially true here in the South. Twenty-two of the twenty-five Goodwill Industries located here have received grant aid under this law during the past 5 years. We wish you and each Member of Congress could visit each of these 22 sheltered workshops and see the progress made. We wish it were possible here to tell about it in detail. We can only cite an example or two.

A Goodwill Industries was started in St. Petersburg, Fla. with the aid of a Federal grant under section 4(a)(2) of \$21, 912 in 1956. A great deal more than the necessary matching funds of \$10,956 was raised by the community. The fruits of this incentive grant have not ended. We can say that last week there were 176 people in this sheltered workshop receiving services they other

wise might not have secured. Tax takers are now tax payers.

A Federal section 4(a)(2) grant to the Winston-Šalem Goodwill Industries of \$9,824 in 1957 created such a revival of concern by the community that by the end of this coming summer, a new million dollar rehabilitation center and sheltered workshop will be completed. Only 3 years ago it was a small workshop serving less than 60 people. The \$50,000 in Hill-Burton funds made this possible with the balance raised by voluntary community effort. It is a fine tribute to the distinguished leadership of the Senator from Alabama, Lister Hill.

In the Memphis Goodwill Industries a demonstration project with the cerebral palsied has been started this year under section 4(a) (1) of Public Law 565. We hope to here learn more that will extend the services of sheltered workshops

in a very needed area.

This "seed" money has worked wonders * * * But it is not enough. The main source of this aid, section 4(a)(2) expired in 1958. It is more urgently

needed now than ever.

A recent survey of Goodwill Industries revealed that for every person served, at least one has to be turned away because there is no available place. Just yesterday, I was told by the executive director of the Atlanta Goodwill Industries that they had a waiting list of over 400 persons.

We just have not kept pace with the great strides in industrial development in the South. Even an enlightened management alone cannot employ enough of the handicapped. Prior evaluation, vocational training, and trial employment is

needed to close the gap between hospital and factory.

Right now there is need and interest to start new sheltered workshops in at least 14 cities across the South. It is a proven fact that Federal incentive grants

can be put to no better use than to encourage the establishment of sheltered workshops in these cities because Goodwill Industries are so largely self-supporting after establishment and so practical in their services. We are glad the chairman of the committee, Representative Bennett of Florida and other Members of the House and Senate have already introduced bills which meet this need. The study of this committee will be most valuable in placing before the Congress a comprehensive picture of the entire field of special education and rehabilitation. But we in Goodwill Industries would hope that some way be found to provide assistance during the interim for the imperative need now. It could take the form of the old section 4(a)(2) with any necessary changes. We old section 1(a) in establishing sheltered workshops across the South.

The accelerated services provided by both Government and voluntary agencies have made it possible for business and industry to employ disabled persons in ever-increasing numbers. Again it must be realized that this success makes the task for the future more difficult but certainly not impossible. We now find in Goodwill Industries persons coming for service with an increasing severity of disability. This means that the modern workshops must furnish evaluative adjustment and training services. For example, the mentally retarded require not only expert medical diagnosis but specialized services for evaluating their work potentiality. This evaluation can best be provided through psychological tests and try-out in a job situation within a sheltered workshop. Not only in mental retardation but in the case of other disabilities, normal living is expedited in a situation calling for emphasis on productive cooperation and personal responsibility. At the same time this deemphasizes the limitations and the "patient" role of the client, while stressing the worker productivity role in society. All this requires well-trained staff personnel. This includes first-line supervisory personnel. It requires more modern tools and working conditions that best create the job atmosphere and skills for tomorrow's employment.

We know voluntary support at the community level will rise to the challenge. But we know that the task is so big that it requires the maximum cooperation of both the voluntary agencies and the Government. We believe the working partnership between Goodwill Industries and the State and Federal vocational rehabilitation agencies will continue to grow and improve. This requires enlightened leadership at the local community level, in the State legislature, and the Congress. It calls for increased recognition on the part of labor and management that the services of the sheltered workshops must receive their whole-hearted support. "We employ the Handicapped" becomes a living slogan with the effective use of the sheltered workshops as a midway testing and training ground. Above all we need an awakened people everywhere that it is ability

that counts, not disability.

Mr. Elliott. The next witness will be Mrs. Grady W. Jones, of Jasper, Ala.

STATEMENT OF MRS. GRADY W. JONES, JASPER, ALA.

Mrs. Jones. Federal financial support of education is an American tradition.

George Washington in his first message to Congress said:

There is nothing which can better deserve your patronage than the promotion of science and literature.

Thomas Jefferson urged the appropriation of public lands for the

support of education.

The Ordinance of 1887, in order that "The means of education shall forever be encouraged," provided for grants of Federal lands to States, income from which is still supporting education in every State in the Union.

Education is not solely a local and State responsibility. Thirty-two million Americans changed community residence in 1957. Over 5 million changed State residence. A child poorly educated in one is a social or economic liability to every State and the Nation.

Authorities estimate that 10 percent of Alabama's school-age children are in need of treatment for speech and hearing problems. Approximately half are suffering with impairment severe enough to

require extensive therapy and specialized speech teachers.

Impairments which are corrected at the early stage of schooling and even before school age will mean much to the economic and social future of the children, as well as the community at large. With specialized training and treatment, they can be an asset to community life, earning their way as they reach adulthood. Otherwise, they could be a burden on society and welfare rolls. The most important needs in this program are:

(1) Teachers who are professionally trained to teach excep-

tional children.

(2) Professional personnel, particularly psychologists, required for scientific screening and evaluation of the mental ability of these children.

(3) Physical, occupational and speech therapists for children in physical handicapped classes. We have 544 crippled children

in Walker County.

Indeed, we must have Federal aid to put on a successful program. I was informed that in the whole State of Alabama we have only 307 special classes. Of the 307 classes, 220 are serving mentally retarded.

In Walker County we have only four mentally retarded classrooms. Three of these are in white and one in colored. Of course, many more of these are needed, and specialized teachers for them. We have only

one class that offers speech therapy.

We in the South realize the great needs in many phases of education, but can see for the first time in 100 years for abundant living and genuine economic prosperity on the horizon. The signs are everywhere: The additional appropriations for education during the recent special session of our State legislature; the magnificent contribution by Congressman Elliott, Senator Hill, his committee and others in setting up a desirable program in higher education, special education, and rehabilitation. And why should we not have confidence?

Dr. Frank A. Rose, president of the University of Alabama has

It is my belief that in the next 15 to 20 years Alabama can become one of the 10 most prosperous States in the entire country. It is quite possible that in only five States—New York, Pennsylvania, Texas, Illinois, and California—will the standard of living exceed our own.

The statements would have seemed unrealistic only a very few years ago. These changes have been brought about by the untiring efforts of our great leaders. We, as citizens of the South, must grasp our

opportunities fully.

Bill 3465 aims to fill the gap in rehabilitation legislation so as to assist the States in providing for their handicapped citizens, greatly improved programs for the evaluation of rehabilitation potential, rehabilitation services for severely handicapped persons who can profit substantially from such services but may not achieve vocational rehabilitation and facilities wherein evaluation services and rehabilitation services may be provided.

We do have rehabilitation agencies in this State and other States to provide evaluation services for applicants for vocational rehabilitation but not for individuals whose objectives are less. Of course, most people believe that evaluation is the weakest link in the present vocational rehabilitation programs.

Last year in Walker County the expenditures for old age and the welfare payrolls almost equaled the total budget for our education for all the boys and girls of the country. Some of the people on the welfare payrolls might be able to earn their own living if they were given an opportunity to learn a trade or would be acceptable under

the independent-living bill.

On December 22, 1958, a small facility was opened in Jasper. It is designed to serve applicants for vocational rehabilitation, but not for individuals whose objectives are less. It is designed to serve qualified handicapped adults in Walker, Winston, and Marion Counties. It provides diagnostic and evaluation services, vocational adjustment, vocational training, limited work employment and cooperative job placement and job followup. We are real proud of our beginning and we feel that filling in the gaps in rehabilitation legislation will greatly improve our program.

Our rehabilitation counselor, Mr. I. J. Pesnell, and his staff are doing a wonderful work with their limited funds and limited facilities. He contacts approximately 1,200 clients per year. Of these,

there are very few that qualify under the present setup.

There are three main qualifications one must pass before he can be

accepted in this facility:

(1) The presence of a physical or mental disability and the resulting functional limitation or limitations in activities.

(2) The existence of a substantial handicap to employment

caused by the limitation resulting from such disability.

(3) A reasonable expectation that vocational rehabilitation service may render the individual fit to engage in competitive labor.

In this area we need a much larger facility and provision made for those handicapped individuals who cannot be absorbed in competitive

labor markets.

I think that the independent living rehabilitation services will greatly improve our vocational rehabilitation services, particularly for the most severely handicapped. As you know, our different agencies already have an effective working agreement with the medical and other professions that will provide independent living rehabilitation services.

Educators need to encourage our young people to train to become physical therapists, occupational therapists, speech therapists, and other professions required in our rehabilitation programs. We need

to acquaint our young people of grants that may be obtained.

Mr. Elliott. Thank you. Lorene, very much for that fine statement. Mrs. Jones has been in the very forefront of interest and activity in this field, about which she speaks so well, in my hometown, in my home county. I appreciate the fine service and leadership she is giving. I appreciate her interest and her testimony.

Are there any questions of Mrs. Jones?

Mrs. Green. Mr. Chairman, I would like to say to Mrs. Jones and Mr. Brown that I am personally delighted to know a couple other leaders from Jasper. We think we have an active and good chamber of commerce in Oregon, but I want you to know that in Washington you have a one-man chamber of commerce for the Seventh Congressional District, and I have yet to see its equal.

This is my first trip to Alabama, and one of the things that I wanted to find out was that if half of the stories that Carl Elliott told us about the Seventh Congressional District are true, you should

be competing successfully with all of your Texas friends.

Mrs. Jones. We are very proud of him and all of them.

Mrs. Green. You should be.

Mr. Elliott. Are there any other questions of Mrs. Jones?

If not, thank you again, Mrs. Grady Jones.

May I say that Mr. Earl York, the county superintendent of education of Cullman County, has been here for some time this morning. He tells me that he will be with us again and that we will see him later today.

Our next witness is Dr. Jack Rosen, director, New Orleans Speech

and Hearing Center, New Orleans, La.

Mr. Rosen, we are very happy to have you here in Cullman, Ala., and we look forward to your testimony. You may proceed.

STATEMENT OF JACK ROSEN, DIRECTOR, NEW ORLEANS SPEECH AND HEARING CENTER, NEW ORLEANS, LA.

Mr. Rosen. Mr. Elliott and members of the subcommittee, in testifying before you, I intended to speak primarily on my own behalf as one who has studied the needs of children and adults with speech or hearing defects, worked with persons with communication handicaps, taught undergraduate and graduate students in audiology, and administered clinical and training programs in this field.

administered clinical and training programs in this field.

As executive director of the New Orleans Speech and Hearing Center, I speak for members of its board of directors and its staff. The Louisiana Speech and Hearing Association has appointed me chairman of a committee to support the passage of your bill, House Joint Resolution 494, and for its several counterparts in either House.

Since accepting your invitation, I have also been asked to represent the Otolaryngology Department and the Speech and Hearing Center

of Tulane University Medical School.

I believe that my views will in general reflect the principles and views of the American Speech and Hearing Association, the American Hearing Society, and other professional and lay societies interested in the prevention, solution, or alleviation of these terrible handicaps.

Unlike the dramatic killers, such as poliomyelitis, cancer, circulatory diseases, and automobile accidents, speech or hearing defects do not kill their victims. Nevertheless, the victims are just as surely handicapped and just as surely crippled psychologically, educa-

tionally, socially, and vocationally.

Unlike blindness, cerebral palsy, and many orthopedic handicaps, the handicaps of speech or hearing have received comparatively little organized publicity to arouse the sympathies and support of the public.

In fact, deafness and speech deviations are among the few handicaps which are still fair game for comic treatment, thus increasing the difficulties in habilitating or rehabilitating the targets of ridicule. Unlike many with severe mental retardation or psychosis, multiple sclerosis, and other neurological or psychiatric disorders, most persons with speech or hearing handicaps now are good prospects for rehabilitation which will permit them to function as breadwinners, church and family members, and complete citizens.

Surveys elsewhere in the Nation have led to the estimate of 8 million Americans whose speech or hearing defects are severe enough to handicap them. On this basis there are likely to be at least 150,000

such individuals in Louisiana.

When geographic, economic, and cultural factors are taken into account, the probability is that this estimate errs conservatively. Aside from the upper respiratory infections which cause many ear pathologies and consequent hearing losses in humid coastal areas, we have a peculiar hereditary pattern of deafness in an area of several parishes—counties—of our State.

Louisiana has excellent speech and hearing clinicians who are equal in training and experience to any comparable group in the Nation. Unfortunately, their number is so few that they must function with the constant frustration of knowing that they are unable to serve the

vast numbers who need their services.

Four hundred speech pathologists and audiologists are needed here. The current membership of the Louisiana Speech and Hearing Association is only 36, and there are 35 associate members, most of whom are undergraduate or graduate students. An individual's competence in this field is recognized by one of several certifications granted by the American Speech and Hearing Association.

Of the 36 members, 24 have basic certification in speech, 4 have provisional basic certification in speech, and 7 have achieved advanced certification in speech. In hearing there are only two with basic

certification and one with advanced certification.

The picture becomes darker when we find that several of the 36 qualified persons are either out of the State, inactive professionally,

or engaged in other pursuits.

Serious shortages of speech and hearing clinicians exist in all parts of the country, but Louisiana and other States in the southern region are undoubtedly affected most severely by the shortage. Fully half the present number in Louisiana who hold advanced degrees in speech and hearing are from regions outside the South or have had to go outside the South to obtain their advanced study.

In order to fill the most urgent job openings for persons with advanced training, it is necessary to entice competent persons from all sections of the country. This is not easily done by programs which have limited budgets and which must attract clinicians from areas

where similar openings and opportunities exist aplenty.

The passage of House Joint Resolution 494 and its Senate counterpart, Senate Joint Resolution 127, for grants-in-aid to graduate students and financial assistance to training institutions will decrease the enormous gap between the needs for and the availability of well-trained speech and hearing personnel. Minor controversies regarding the assignment of administrative responsibilities should not be

permitted to delay or interfere with passage of this urgently needed measure.

It should not be overlooked that speech pathology and audiology have responsibilities for the rehabilitation of the millions of adults of all ages with difficulties in communication, as well as for the children who need our services. It is quite fitting that the Office of Vocational Rehabilitation, which has several years of experience in the administration of training grants and other assistance to this field, be charged with the responsibility given it under title II of your bill. House Joint Resolution 494 is a major step in the right direction, and I urge its passage upon all Members of the House of Representatives.

In addition to House Joint Resolution 494 and Senate Joint Resolution 127, the Congress can foster the development of speech and hearing facilities in other ways. Others have voiced the need for aid to the establishment or expansion of centers for the evaluation and rehabilitation of the hard of hearing, the deaf, the speech handi-

capped, and those who fail to develop language or speech.

New centers are needed in some areas, but many communities throughout the Nation have speech and hearing centers, clinics, or hearing societies. Most of these operate on a private, nonprofit basis with the support of united funds, community chests, universities, civic

organizations, and private benefactors.

In view of the personnel shortages, new centers will have to take trained personnel from existing centers which can ill afford to lose their staffs, employ inadequately trained personnel, or lie idle during the several years of anticipated personnel shortage. Wherever a center exists, therefore, priority should be given to assisting the existing speech and hearing center to expand its facilities, to acquire modern electronic and electro-accoustic equipment, and to add to its staff.

Each staff member added to an existing speech and hearing center increases the efficiency and economy of its services to the handicapped. New graduates from our training institutions will gain the valuable experience of working in established programs under the supervision of more experienced persons in the field. Eventually, externeships should be established in such centers for the professional experience

which should precede unsupervised professional work.

The needs of the speech and hearing handicapped can further be served by the encouragement of research. Fundamental research in communication, audition, and in the physiological and psychological processes involved will continue to contribute mightily to our ability to grapple with the imposing and often mysterious ailments with which we contend. However, basic laboratory research in itself does not supply knowledge which we can apply directly in the clinic, nor is this its purpose.

In fact, there is an enormous gap between the data supplied by laboratories and the applicability of such data to clinical problems. Applied research, best done by clinicians who know the problems first-hand, is needed to determine the applicability of the vast data available and also to suggest specific topics for laboratory exploration.

Highly trained clinicians in speech pathology and audiology are able and eager to explore the complexities of communications problems in the children and adults with whom they work. They find it extremely difficult to obtain the necessary financial support for such explorations unless engaged in basic research in university laborato-

ries or in Federal or State agencies.

I urge that restrictions be removed from future grants by the National Institutes of Health, the National Science Foundation and other public agencies in order that private, nonprofit agencies may conduct practical research in existing speech and hearing centers on clinical subjects readily at hand. Such a policy would multiply our research results with minimum expenditure of public funds.

Mr. Elliott and members of the subcommittee, thank you for providing this opportunity to express these special needs in the fields of special education and rehabilitation of the hearing and speech impaired. All who work in this and related fields, and all the handi-

capped and their families will appreciate your efforts.

Our sincere hopes go with you that your efforts and ours will alleviate the distress of millions of people throughout the Nation.

Mr. Elliott. Thank you very much, Mr. Rosen. Are there questions

of Mr. Rosen?

Mrs. Green. How many institutions are there for training teachers for the deaf now?

Mr. Rosen. There are no institutions for training teachers of the

deaf in Louisiana.

Mrs. Green. How many are there across the country? Do you know?

Mr. Rosen. This is difficult to say, because there are opposing schools. There are some which still adhere to old methods, in which the so-called combined training is used, that is, the use of finger spelling and speech, and others which concentrate on the development of speech and lip reading that is normal, oral communication.

Somehow it is difficult to combine the figures for the two types.

Mrs. Green. I notice in House Joint Resolution 494 it says, "Whereas at least six of the institutions accredited for the training of teachers for the deaf have no trainees enrolled for the academic year"—why is this, when you have six institutions?

Mr. Rosen. Teachers of the deaf receive the same salaries, as a rule, as teachers of regular classes. This is also true of speech and hearing therapists in the public schools. Nevertheless, although their salaries are the same, they are required to have additional training.

usually training on a graduate level.

In fact, from the speech pathologist's and audiologist's point of view, unless they do add graduate work, they really are not truly qualified. For them to afford this additional graduate training requires a special dedication, since their rewards after they graduate are not going to be any greater than those of regular classroom teachers.

Mrs. Green. What will title I accomplish if we already have six institutions that are fully accredited and then under title I, section 101, the Federal Government would establish and give some grantsin-aid to public and nonprofit institutions if we cannot get the trainees?

Why go on with the program?

Mr. Rosen. Title I provides for assistance to students, to graduate students. We believe that this assistance to graduate students will require this additional training and may encourage students who otherwise would not be able to proceed further with their studies.

In that case, the six institutions with no trainees would soon have trainees.

Mrs. Green. As I understand it, it would be grants-in-aid to the

institution in covering the cost of the program.

Mr. Rosen. I am not as familiar with title I as with title II. I know that in title II, and I thought in title I, there was the direct aid to students as well as to the institution.

Mrs. Green. My point is if we have the institutions and they are already set up to go ahead and we do not have the trainees, we are not going to do anything by just giving more money to them from the Federal Government; are we?

Mr. Rosen. That is probably correct.

Mrs. Green. All of the emphasis would have to be on paying higher

salaries to the individual or to pay for fellowships.

Mr. Rosen. Graduate fellowships first, under title I, I imagine. Under title II, however, I believe that the two forms of assistance are needed immediately.

Mrs. Green. I notice in this bill they use the same figure you have used, 8 million Americans suffering from speech or hearing impair-

ments. How did you arrive at that figure?

Mr. Rosen. These estimates are based upon surveys done in several communities and in a few larger areas within several States and are derived also from the accumulation of figures of the White House Conference of 1950, I believe.

Mrs. Green. How do you get the figure of 20,000 speech patholo-

gists and audiologists being needed?

Mr. Rosen. Approximately 1 to every 400 who need their services. This, by the way, on a clinical basis, is far too great a caseload. This is the caseload frequently among public school speech and hearing therapists.

For the person who operates in a clinic or hospital and who does largely work with individuals, rather than groups, the average caseload would more likely be 50. Therefore, the number of speech pathologists and audiologists needed is also a conservative estimate.

Mrs. Green. For my own information, could you answer the question I directed to one of the previous witnesses on this study which I have read about, that many of the mentally retarded were diagnosed wrongly and that it actually was a speech or hearing impediment? Is there such a study?

Mr. Rosen. I know of no formal studies that have shown this, but all of us in the field have experienced many incidents of this sort. The fact is the incidents work in both directions. We also have many hard of hearing and deaf children supposedly who are really mentally re-

tarded.

Mrs. Green. This is my point.

Mr. Rosen. It works both ways. In the institutions for the mentally retarded there are some people who would not have been there if the diagnoses had been correct early enough. We are particularly concerned about early diagnosis of very young children to determine if this is hearing loss, mental retardation, certain forms of brain damage or certain forms of psychic disorders. This is one of our major functions.

Mr. Daniels. Do we have a sufficient number of teachers to train

people in speech therapy and audiology at the present time?

Mr. Rosen. We might say that we do, if we rob Peter to pay Paul. The problem is that the same people who are well trained to teach are also well trained to do the work. They always have the problem of deciding where to place their efforts.

For example, in the past I was professor of speech and hearing at Western Reserve University in Cleveland, at which time a major portion of my work was devoted to teaching, to teaching audiology. day a major portion of my work is in administering and doing clinical work, administering a clinical program and doing clinical work.

I have the choice of which I can or would do. I cannot devote full

time to each, although sometimes I feel as if I am doing that.

Mr. Daniels. Then as I review your testimony, we will have a problem getting sufficient teachers to go into these particular fields to train the necessary personnel?

Mr. Rosen. I believe an adjustment will occur.

Mr. Daniels. An adjustment of salary?

Mr. Rosen. Yes. That is, when the institutions have assistance to conduct their training programs, they will be able to attract people not just on the basis of salary, because salary has not always been a primary goal of people in our field. We are quite young and most of us still feel the strong air of dedication.

I think also the possibility of a flourishing training program with associated research programs will attract people to the universities as well as some increase of salary. The salary would not hurt, of

Mr. Quie. The six schools, or institutions, that are spoken of have no trainees enrolled at the present time? Do they teach the new or the old system? Do they teach the use of sign language for teaching the deaf?

Mr. Rosen. There will be a witness this afternoon who represents the Louisiana State School for the Deaf who is a teacher of the deaf. I am not. I would much prefer that the questions in that area be directed to her.

Mr. Quie. Do you think there are sufficient school facilities now for training of teachers of the deaf and for speech pathologists, but just that we need some stimulus to bring more people into the program?

Mr. Rosen. There is a great enough number of institutions with training programs; yes, I would say. Of course, if we discover that people start flocking to our field, we may find that we do not have But at the present I would say that there is a great enough The problem is in encouraging the development of pronumber. grams that exist.

Mr. Que. Is it not also true that many times teachers of the deaf, anyway, and perhaps teachers of the speech-handicapped, are actually

paid less than comparable teachers in the public schools?

Mr. Rosen. In some cases I believe in residential schools part of their salary is given them in the form of housing and meals. This might be considered as less salary. There may be some private schools where the salary scales are lower than the public school levels for regular teachers, but as I said, in that area, too, I am not as well versed as I should be.

Mr. Elliott. Thank you very much, Mr. Rosen.

Mrs. Westmoreland, consultant in special education, Texas Education Agency, Austin, has telephoned that she cannot be present due to illness.

We have eight or nine witnesses to hear before lunch, and I will have to say that, as much as I hate to do it, we must limit our witnesses

to 10 minutes.

Next we will hear Mr. William J. Miller, Florida Rehabilitation

Association, Tallahassee, Fla.

Mr. Miller, if you have a written statement, you can submit it for the record or summarize it.

STATEMENT OF WILLIAM J. MILLER, FLORIDA REHABILITATION ASSOCIATION, TALLAHASSEE, FLA.

Mr. Miller. Thank you.

First, I would like to thank you, Congressman, and the rest of the committee, for the opportunity of coming here and meeting with you and discussing the problems and needs of the handicapped people, and convey to you greetings from our board of directors.

I was instructed to urge passage of the independent living bill as has been presented to Congress in H.R. 3465. Some of the reasons

that we feel that this is needed in Florida are as follows:

In 1954, when Public Law 565 was passed, it broadened the scope of our service and enabled many demonstration and research projects to go on. This enabled the rehabilitation agencies in the State to handle a group of people that, prior to this time, they had been unable to rehabilitate vocationally.

It also indicated that, or told us, that we still do not know the potential of people that can be rehabilitated vocationally. But we did find a large group of people who needed other services in order to

live independently.

We know that in nursing homes and in our communities there are a large number of individuals who need personal adjustment services in order to be independent and not have someone taking care of them; that this not only is expensive, but it is only humanitarian and sound that these people be offered some opportunity to live independently.

The Florida Legislature, last year, passed an enabling act so that the division of vocational rehabilitation could provide independent living services. This was passed after the present law had been introduced in the Congress, and primarily would enable us to take ad-

vantage of such a law if it were passed.

At the hearing conducted by the committee in the passage of this bill, there were representatives from the public and private agencies, representatives of the medical profession who had been working with the division of vocational rehabilitation. This bill passed unani-

mously both houses of the legislature last year.

We feel that postponement of the passage of the Federal act would deter the rendering of services to a large number of people that need this service now, and that the money that is in this bill in Congress probably is about enough to start some demonstration projects in various States as to what really can be done in providing independent living services and would give some idea, probably, of the cost of this program.

We would like to urge that H.R. 3465 be passed as early as possible. That is all I have.

Mr. Elliott. Thank you very much, Mr. Miller.

May I say to you, Mr. Miller, that your written statement will be made a part of the record immediately following your oral presentation, if you desire.

Mr. MILLER. That will not be necessary, Mr. Chairman.

Mr. Elliott. Are there any questions?

If not, thank you very much.

Our next witness is Dr. Arthur H. Dohlstrom, professor of mental health, University of Alabama School of Nursing, University, Ala.

STATEMENT OF DR. ARTHUR H. DOHLSTROM, PROFESSOR OF MEN-TAL HEALTH, UNIVERSITY OF ALABAMA SCHOOL OF NURSING

Dr. Dohlstrom. Mr. Chairman, members of the committee, ladies and gentlemen, originally I was invited here as a member of the American Association for Gifted Children, but I should much prefer, if I may in this very brief time, to talk about all children and all people who need help in special education or in rehabilitation.

In my contacts throughout the State, and they have been quite varied because of my position and my previous positions as a consultant, I have found a high degree of interest, a very fine awareness, and a great, intense desire to do the very best job that can be done in

both of these important fields.

However, I also find that the lack of trained personnel is the most serious detriment that we have in the State of Alabama. When I talk of trained personnel, we have real shortages in all of the fields that have direct contact or should have direct contact with these people.

Other witnesses have mentioned the need of therapists, physiotherapists, occupational therapists, speech therapists, social workers, nurses, psychologists. You name them and we need them, and we need them badly.

I would like to make the strongest possible bid for your serious consideration and support of traineeships and fellowships for the train-

ing of the necessary personnel.

I have found also throughout our State a very fine spirit of cooperation, people working together so well. I think if we had the people, the personnel, to do this important job, we could be way high on the list of any of these 50 States in the end result of what we would

hope to accomplish.

I might mention to you the three fields wherein I have had some intimate acquaintanceship—social work, psychology, and nursing. We have found that one of the better ways of getting people to work in these important areas in Alabama is to get Alabamans to have the opportunity of going away to school and then come back and do the job here at home.

I make this plea for the traineeships and scholarships that will en-

able our people to do this.

In the area of vocational rehabilitation, one of the greatest needs as I have seen it has been for perhaps a more intensive and prolonged diagnostic evaluation of the people who are in need of the services and then continued therapy and further evaluation as they go through

the rehabilitation process.

I think it would be extremely helpful to us here if we had some funds available that would permit the establishment of new facilities rather than merely the extension or the refurbishing of some of the present ones. We are badly in need of facilities, too.

I have made my two strongest bids. I would like very much, if I

may, to answer questions in the brief time we have left.
Mr. Elliott. Are there questions of Dr. Dohlstrom?

Mrs. Green. You have said there is a great dearth of adequately trained personnel in many, many areas, and certainly in the field of nursing, itself, there is a dearth of graduate nurses.

Are you suggesting that perhaps this is not the right approach, for instance in 494, to train teachers or to pass legislattion for the training

of teachers for the deaf?

Dr. Dohlstrom. No. They have great needs, and this is one of our important areas. The president of the school is attempting to do a job with the people we have. When I said the training of teachers, this starts at the university level.

In the College of Education at the university, we have openings where it is not possible to get the people to come to teach the teachers.

Mrs. Green. But you would like trainees and fellowships in many areas besides the training for the deaf?

Dr. Dohlstrom. Yes.

Mrs. Green. In other words, you would like a more comprehensive program.

Dr. Dohlstrom. Definitely.

Mrs. Green. Can you tell me if the American Medical Association has taken action on either of these bills, either the Alabama Medical Association or the national?

Dr. Dohlstrom. The "doctor" stands for a Ph. D. in clinical psychology and I cannot answer for the American Medical Association.

Mrs. Green. You have no knowledge of their position?

Dr. Dohlstrom. No, ma'am; I do not.

Mr. Elitorr. Are there any other questions of Dr. Dohlstrom? If not, thank you very much, Dr. Dohlstrom. Your testimony has been very helpful and we appreciate your kindness.

Dr. Dohlstrom. Thank you, Mr. Elliott.

Mr. Elliott. Our next witness is Dr. Thomas S. Gibson, of the American Optometric Association, of Huntsville, Ala.

Dr. Gibson, will you give us a word of background and then proceed in any manner you desire?

STATEMENT OF DR. THOMAS S. GIBSON, AMERICAN OPTOMETRIC ASSOCIATION, HUNTSVILLE, ALA.

Dr. Gibson. Thank you, Mr. Chairman. I shall do so, sir. My name is Thomas S. Gibson, and I live in Huntsville, Ala. That is the rocket city and also the hometown of Senator Sparkman.

I have practiced my profession of optometry for the past 20 years. I am here today representing the American Optometric Association, of which I have been an active member for the past 20 years. I have served as president of the Alabama Optometric Association, and as a member and president of the Alabama State Board of Optometry.

I have served as president of the Huntsville Rotary Club, the YMCA, the Madison County Chamber of Commerce, the United Givers Fund, and as chairman of the board of stewards of the First Methodist Church. In 1959 I served as Alabama crusade chairman

for the American Cancer Society.

The American Optometric Association is to optometry what the American Bar Association is to law, or the American Medical Association is to medicine. The membership of our association comes from all of the 50 States and the District of Columbia. The membership is the largest single professional group offering their services in the field of vision care. I am honored to represent this association here today.

Now, as to the purpose of my appearing before this distinguished committee: I hope that I will be able to state this purpose clearly, and I know that I shall state it sincerely. We, the members of the American Optometric Association, once again wish to volunteer the services of our association and its individual members to all agencies of government which are now or may be concerned with the problems of vision care and the rehabilitation of the visually handicapped.

There are many facets in the field of vision care and rehabilitation which are already law. Others are pending and still others will be

introduced. I shall return briefly to this subject later.

Mr. Chairman, I am sure that in the fields of rehabilitation and special education, the terms "vision," "blindness," "subnormal vision," "partially blind," "occupational vision," "rehabilitation of the visually handicapped," and many more on this subject will be brought to

the attention of this committee.

The American Optometric Association and its membership have pioneered in this field. The records of successful rehabilitation of these visually handicapped are commonplace in individual optometric offices and clinics. Our journals, our seminars, our colleges of optometry, our research facilities make this field of rehabilitation of the visually handicapped our No. 1 project. The results of research, new and improved methods and instrumentation are made available to each member of our profession.

Our profession also supports the American Optometric Foundation, a research organization of which Dr. William C. Ezell of Spartanburg, S.C., has been president for many years. This organization finances research and fellowships in the field of vision not only in optometric schools and colleges, but also in other institutions of higher

learning.

We also offer the full cooperation of the American Optometric Association's Department of National Affairs, of which Dr. Joseph M. Babcock of Portsmouth, Ohio, is director, to this committee, and we urge when legislation is proposed pertaining to the visually handicapped and their rehabilitation, that members of our profession be named to serve along with members of other professions in the health field.

Now, very briefly as to pending legislation that may affect our membership: First, we want to thank the House of Representatives for passing H.R. 10, which is now before the Senate. This bill, as you may well remember, will provide the self-employed an opportunity to secure some slight income tax benefit provided they elect to

augment their social security with a voluntary retirement fund. We

urge that the Senate act favorably on this bill.

Second, and this is to me the crux of the matter, is bill H.R. 7966. The enactment of this bill will mean a great deal to the visual welfare of our veterans from the Spanish American War through the Korean conflict. We certainly solicit the support of the members of this committee for the passage of H.R. 7966. However, in this presentation I am using it as an example of discrimination against our profession.

For example, under existing conditions, a patient of mine goes to a veterans' hospital or facility. He may receive the services of an optometrist while in the hospital, but when he is dismissed for outpatient care, he may not come back to me or any other optometrist, but must be referred for outpatient care only to another profession in

the vision care field.

It does not appeal too much to our ego to have a patient for a number of years, and then have the patient go into a federally supported institution and receive outpatient care afterward from another person. They say to him that it is impossible for him to come back to me.

Certainly this procedure is unfair to the optometrists, but in even

a larger degree it is unfair to the veteran.

As stated before, the membership of the American Optometric Association is the largest in the vision care field and offices of its members are to be found in the smaller cities, towns, and rural counties. In many cities, towns, and counties the only professional care repre-

sented in the vision care field is optometry.

For instance, this Seventh Congressional District of Alabama includes nine counties, all of which have optometrists for vision care. Only four of these counties have both optometrists and other professional men in the vision care field. In the State of Alabama there are 36 counties in which all of the vision care and rehabilitation is provided for by optometrists. Thirty-six out of the sixty-seven counties in Alabama have no other person in the visual care field except optometrists.

Attached to my statement are two maps. Map No. 1 represents the counties in Alabama which have optometric offices, most of them. There are about six that do not have. The second map, map No. 2, represents the counties in Alabama that have professional people that do eye work that are not optometrists; in other words, ophthalmologists or eye, ear and nose and throat specialists, which shows that the coverage we have is much greater. I think that ratio would exist in

the other States in the Union as well.

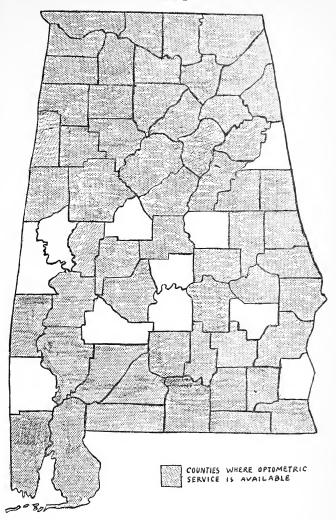

This information was compiled from the records of the Alabama Optometric Association and the membership roster of the Alabama Medical Association. We believe that Alabama reflects the national

picture.

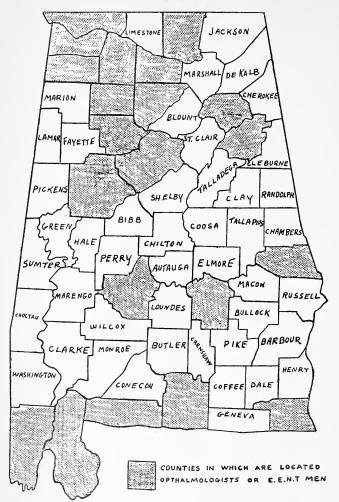

Map No. 2 shows at a glance the many areas in our State that necessitate a great deal of travel to veterans, who perhaps can least afford it. Map No. 1 shows that this condition would be greatly alleviated by the passage of H.R. 7966, and would make available to the veterans throughout the State vision care on an outpatient basis, close to home.

(The maps referred to follows:)

MAP 1

MAP 2

Dr. Gisson. We submit that optometry should be represented on all boards, committees, and other agencies established by Government dealing with the problems of vision and its rehabilitation, and that the American principle of freedom of choice by the individual should not be redistributed. He should be allowed to receive optometric vision care if he so desires.

Optometry has come of age. A person must take 2 years of preoptometry and 4 years in a professional school. In Alabama we have

a period of interneship before he is entitled to practice.

We, therefore, again volunteer the services of the standing committees of the American Optometric Association to this committee, and sincerely trust that any legislation which it may recommend to the Congress will provide that optometry may be fully utilized in the service of all who are visually handicapped, and that State and local authorities, in order to secure matching funds for their vision programs, must make available to the recipients who desire to utilize them the services of optometrists.

Mr. Elliott. Thank you very much for your testimony, Dr. Gibson. We appreciate it very much. It is clear and compelling. It will be

very helpful to us in our deliberations.

Our next witness is Miss Mary P. Marriott, director, Rehabilitation Center, Louisville, Ky. Miss Marriott represents the Kentucky Divi-

sion of the American Cancer Society.

We are happy to have you and you may proceed in any manner you desire, subject to our time limitation, for which I apologize but which is necessary in view of the circumstances.

STATEMENT OF MISS MARY P. MARRIOTT, DIRECTOR, REHABILITA-TION CENTER, LOUISVILLE, KY., REPRESENTING KENTUCKY DIVISION, AMERICAN CANCER SOCIETY

Miss Marriott. I consider it a privilege to be here. Mr. Tucker, the executive director of the Kentucky Division of the American Cancer Society, could not be here. He is a member of the Rehabilitation Center Board of Directors and supports our postlaryngectomy speech

program.

Rehabilitation Center, Inc., of Louisville, opened in 1954 as a non-profit private agency dedicated to the rehabilitation of physically handicapped persons of all age groups during and after the acute phases of their illnesses. Medical direction is supplied through two full-time physicians who are accredited specialists in the fields of physical medicine and rehabilitation. The agency is affiliated with the University of Louisville School of Medicine. Its medical director is head of the university's Department of Physical Medicine and Rehabilitation.

Services consist of medical evaluation and treatment, physical therapy, occupational therapy, social service, psychological and vocational counseling, recreational therapy, rehabilitation nursing, prosthesis and bracing—all designed to return the handicapped child or adult to as near normal living as possible. Special clinics held are the upper and

lower extremity prosthetic clinics and the cardiac work classification

clinic

To achieve its aim, the center must employ professional personnel especially trained to meet the patients' needs. The staff must act as a team, recognizing that each person is entitled to every service offered, but that he must often be helped to understand the need for and want the treatment before he can obtain desired value from efforts in his behalf; in other words, members of the team must realize that their goal must be the patient's goal before any amount of treatment will achieve lasting results.

The philosophy of the rehabilitation center is based on the concept of treating the patient as an individual human being and not as a disease or a deformity. His differences and his requirements are studied, and he is helped to reach his best adjustment of his functional level.

It should be pointed out that rehabilitation starts the moment the physician or surgean begins applying curative measures. The practicing physician must always think of the end results of medical or surgical treatment. New skills learned in the physical restoration of the patient must be applied from the day the patient becomes acutely ill.

Bed position, for example, must be thought of to prevent contractures and to enhance early activity. Muscles and joints must be kept in as good functional state as possible. Many physical procedures to keep the body in good physicocondition during recovery from an acute illness are in use today in modern treatment of disease. In addition, vocational and social services are utilized during the acute phase or very early convalescent phase when indicated.

As shown in recent surveys, many of the chronically ill patients who are kept in the hospital out of medical necessity ordinarily do not receive the treatment that is necessary for the successive stages of rehabilitation to be productive. This fact, coupled with an increasing incidence of traumatic injury and an aging population points up to the

ever increasing need of rehabilitation facilities.

Take postlaryngectomy speech for instance. It has been estimated by the national office of the American Cancer Society that there are between 12,000 and 15,000 laryngectomized individuals, with approximately 1,000 new cases occurring annually in the United States.

Postlaryngectomy speech training offers one of the most complete rehabilitation processes known to physical medicine; yet, until recently, facilities for this specialized field have remained inadequate. Few cities have had organized postlaryngectomy speech training programs, and students in speech have graduated with little or no training in this particular field.

In the past 10 years, however, there has been an increasing interest in rehabilitating the laryngectomized individual and more schools and agencies have initiated programs in an attempt to meet the

growing need

If this need is to be met adequately, more teachers must be trained in the specialized techniques of developing postlaryngectomy voice. The Department of Health, Education, and Welfare, Office of Vocational Rehabilitation, sponsors at least two short courses in university-connected medical schools, but this program needs to be expanded in order to provide enough teachers to train all laryngectomies.

There is a need, too, for public education in order that laryngectomized person may be accepted by society and be able to return

to gainful employment.

Consider that there are approximately 8 million people of all ages in the United States who are in need of speech and hearing therapy. To treat this number, 20,000 workers are needed in this field. This includes pathologists who diagnose, teach, and do research; therapists who work in the clinical situation; and correctionists who work with articulation in the school situation.

At the present time there are 2,000 workers in this field who are certified by the American Speech and Hearing Association. Approximately 5,000 are in training. This includes students and teachers who are working in the field for certification. To meet the present need, we should have approximately 1,500 graduates per year in the field of speech and hearing therapy; however, we have only 400. This gives a picture of the great need in this field.

In the field of physical medicine and rehabilitation there are from 300 to 400 trained physicians. The patient need approximately doubles this number. This situation applies to physical therapists, occupational therapists, vocational counselors, social workers and

psychologists.

The population increases each year. With more and more children,

the need will be greater each year.

The United States is a great place for organizations to help people. We have societies which are interested in all the diseases of the body. You can start up at the head and find that emotionally disturbed children have the Society for Mental Hygiene to help them; we have blind children, and the Society for the Prevention of Blindness, and a Society for Prevention of Deafness. We have societies to help those with cardiac conditions, poliomyelitis, arthritis, cerebral palsy, cancer, muscular dystrophy, multiple sclerosis.

A society is started around every disease. All of these efforts deserve praise and help but one wonders about the person who has

a disease which does not have an organization to help him.

We must remember that in rehabilitation we do not treat diseases but persons with disabilities. It is just as important to know what person has the disease as what disease the patient has. It is easy to become so interested in the cause and diagnosis that we forget we are

treating persons with disabilities.

Appeals for aid on an emotional basis is justifiable, but we should present the economic aspect of the problem. If a child, or adult, is so handicapped by a residual disability that it is necessary to place him in an institution, it will cost a minimum of \$2,000 a year for his care. If you put 10 children in an institution you are spending \$20,000 a year. Why not spend a few thousand right now and keep them out of an institution, and make their lives happier and more productive?

Urgent needs in rehabilitation as we see them at the Louisville

center are:

(1) Training for postlaryngectomy speech therapists. Our speech therapist has had a complete laryngectomy. She has had therapists work with her and is now able to pass this training on to our patients

in such a way that they benefit greatly. Surgeons refer patients when they enter the hospital for surgery so that the therapist can help them to understand just what is coming—that when they recover from the anesthetic after surgery, that is, when they wake up in their hospital rooms, they will not be able to speak again until they are trained. So many people have had these laryngectomies that trained speech therapists are greatly needed.

(2) Schools of physical and occupational therapy, as well as schools of speech therapy in Kentucky would help to train local people and result in less turnover of personnel. These occupations also should be publicized to a greater extent so that more young people will be

drawn to them.

(3) Scholarships: Aids to students in training for speech, occupational and physical therapy might help to interest young people as

workers in these fields.

(4) Architectural planning to meet the needs of the handicapped youth in each new school, including special facilities such as elevators, ramps, and restrooms allowing the student to get his wheelchair into the room. This is needed so that the handicapped youth need not be regulated to special classes, but may attend school in normal school situations at regular schools.

(5) Government grants to enable universities to establish the necessary curricula to train students in physical, occupational, speech therapy, et cetera. I would like to see the Government give out-andout grants to universities to furnish personnel, as too often the universities do not have money for matching grants for such purposes.

(6) Larger appropriations for the State bureau of rehabilitation services. This agency does not have enough money to cover the needs of people that need their services. An out-and-out Government grant would give the agency the money to meet the needs and expand their program.

If we are to help handicapped persons become physically, emotionally, socially, educationally and vocationally prepared to take their places in the community, we must all work together as a team to obtain

our objectives.

Mr. Elliott. Thank you very much, Miss Marriott. Your testimony has been very fine and it will be helpful to the committee.

I wish to recognize Judge Marvin Scott, a longtime judge of

Cullman. We are happy to have him with us today.

Also, may I note the presence here of a former Member of Congress from the State of Tennessee, Mr. Pat Sutton, who now, I believe, has become a resident of Alabama.

Mr. Sutton. That is right, Mr. Chairman. Mr. Elliott. We are happy to have you.

Our next witness is Mr. Milton K. Cummings. Is Mr. Cummings here?

If Mr. Cummings is not here, our next witness is Mr. Harry De-Lany, executive director of the Georgia Association of Workers for the Blind.

Mr. DeLany, the Subcommittee on Special Education is happy to have you as a witness. You may proceed at this time.

STATEMENT OF HARRY DELANY, EXECUTIVE DIRECTOR, GEORGIA ASSOCIATION OF WORKERS FOR THE BLIND, ATLANTA, GA.

Mr. DeLany. Mr. Chairman, members of the committee, I would address myself, I think, primarily to the recommendation that you pass H.R. 3465.

It seems to me that this will would provide a great deal of legislation that has been needed at least in out Southland for a good many

years.

I can identify myself with the rehabilitation movement since 1923, Mr. Chairman, when I was the first youngster sent to college, that is liberal arts college, on rehabilitation. There we get into objective, Mr. Chairman. I have been having trouble with that word "objective" for all these years, both as a client in rehabilitation and as a counselor in rehabilitation, for I did serve with the State department of education in my State as a counselor in vocational rehabilitation.

When you send your own child to college, do you demand of that child that he tell you precisely what he is going to do when he finishes

college?

I will answer for you that you do not, because he does not know, and neither does the blind child. Yet we require of our handicapped people that they tell us what they are going to do at the time they start college, not when they finish. That has always been a bugaboo to me.

The matter of independent living is the next item. It seems to me that if we can get a bill through where we do not have to prescribe the objective, it will give for a better independent living. We would

greatly facilitate the whole field of rehabilitation.

Now, as to workshops in rehabilitation, Mr. Chairman, I would address myself there to that subject for a moment and say to you this: that during the period from 1923 to 1943, we had very few departments for the blind as separate entities in rehabilitation, and there were very few blind people rehabilitated by the several States. Only those people who had, maybe, a special ability, or who demonstrated by some—since I said I went to college on rehabilitation, I hate to say they had to be fairly smart, but they did—they had to have some sort of special ability or they were left in the cold.

If we put our workshops for the blind and just make workshops for the rehabilitation of the handicapped out of them, it will mean that our blind people will be, generally speaking, left out, unless the

blind person shows a special adaptability.

As for evaluating services, I would like to say a word or two on that. On evaluating the services of rehabilitation, I do think that there are several unmet needs there. First, we should go back and review the cases that we have handled in the past 20-odd years, and see how many of those cases could be restudied, and maybe the objective changed, and the person rehabilitated so that it would enhance his livelihood and his standard of living, and his own ability to be a normal citizen in his community.

We have rehabilitated a good many people by buying them a couple dozen chickens when, if we are going to put them on a poultry farm, let's make them either study poultry husbandry and really get into the business, or just leave off the couple of dozen chickens because that does not work. I admit that it has helped, and in family rehabilitation, where we help the members of the family, that is a great field, Mr. Chairman.

I do not mean to minimize that. But it has been overdone in our State. We have some 10,400 blind people in our State, and we have a great many people that will not come under the definition of blindness. They are between 20-70 and 20-200; they have vision between 20-70 and 20-200. These people are the forgotten people, and it seems to me that in putting out this new 3465 we should put a good deal of thought to those people. But I believe that those people would be better handled by your agencies for the blind than by general rehabilitation as they are handled in most States now.

The people in general rehabilitation are not specifically trained to work with visually handicapped people. After all, I believe it is the general consensus that of all rehabilitation clients, the visually handi-

capped client is the most difficult client to train and place.

That concludes my statement, Mr. Chairman.
Mr. Elliott. Are there any questions of Mr. DeLany. If not, we thank you, Mr. DeLany, very much for your kindness and presenta-

Mr. DeLany. Thank you for allowing me to come. Mr. Elliott. Your testimony has been very helpful.

Our next witness is Mrs. J. A. Holecamp, of the Alabama Congress of Parents and Teachers, Birmingham, Ala.

STATEMENT OF MRS. J. A. HOLECAMP, ALABAMA CONGRESS OF PARENTS AND TEACHERS, BIRMINGHAM, ALA.

Mrs. Holecamp. Mr. Chairman and members of the Subcommittee on Special Education of the Committee on Education and Labor of the U.S. House of Representatives, I am here representing Mrs. G. C. O'Kelley, president of the Alabama Congress, a branch of the National Congress of Parents and Teachers.

The Alabama Congress of Parents and Teachers, speaking through its president and her designated representatives, expresses sincere appreciation for your invitation to appear at this public hearing and

speak on behalf of one specific need of Alabama's children.

We are not here to speak for any particular bill, although we are deeply interested in securing provisions whereby we may have more trained personnel who know, understand, and are prepared to help

with the education of exceptional children.

We, as an organization of more than 200,000 memberships, are cognizant of this great need to provide classes for these children who come within the framework of special education. Let us keep before us, however, that we are interested in all children, the average, the gifted, the exception, America's richest and most valuable resource.

We believe in public education. We believe that the public school system should be maintained and strengthened. We believe emphatically that education is a State function, to be administered through local school boards. Annually, at our State convention, where delegates assemble from our 866 local parent-teacher associations, we adopt a program of legislation. We support this program from the

local level to the State legislature. Therefore, our membership, through its convention action, approves this program each year.

Our invitation to this hearing was communicated to the members of the board of managers, which was in session when Mrs. O'Kelley re-

ceived it. I am here today through its authorization.

The Alabama Congress of Parents and Teachers is vitally interested in helping with the special education program. This year it sponsored two regional meetings on the curriculum, with special education included. The State supervisor of special education was on the program. Local parent-teacher associations have centered program emphasis and given assistance to the special education teachers.

Councils have worked closely and effectively with superintendents in getting classes underway by providing moral and financial support for special equipment. The trend is forward to help provide education for these exceptional children through special classes which

are an integral part of the public school program.

It would be impossible for a voluntary and strictly nonprofessional person to know all the technical facts concerning exceptional children

in this State.

I am the mother of four physically and mentally strong children; I can, therefore, speak proudly of them, want the best education for them, and at the same time keep the desire for those less fortunate

in mind.

In 1955 our State legislature enacted into law a bill relating to the education of exceptional children. This law provided for the State board of education to provide funds to city and county boards of education. The rules and regulations are well known. This bill became a law in August of that same year.

Alabama has a State supervisor in special education. She is well qualified and well trained. There is an urgent need for more staff

on the State level.

Alabama has 305 teachers employed in 77 school systems. Alabama has 4,600 children enrolled in these classes. It is estimated that 80,000 children need to be in special classes; yes, 80,000 children.

Alabama is seeking to help the exceptional children, but the problem is great. It needs further aid for these children in order to provide special education classes.

Our educational needs in Alabama are many. Each has an urgency.

In the area of special education, the need is long.

You, gentlemen, are familiar with these facts. I need not present them to you; my confidence and respect for your knowledge relative

to your committee's task is implicit.

The Federal Government can help by providing funds for use through State departments of education in this area as it is already doing in many other areas. The hour is here; let us not be late.

Mr. Elliott. Thank you very much, Mrs. Holecamp.

Are there questions of Mrs. Holecamp?

Mr. Quie. I just want to see if I have the figures straight.

You say there are 4,000 students presently enrolled in special classes and there is a need for special classes for 80,000?

Mrs. Holecamp. Yes, sir.

Mr. Quie. And how many do you have in residential institutions, like the school for the deaf, the school for the blind, and so forth?

Mrs. Holecamp. I do not know. I am sure that Mr. McBride,

when he testifies, will be able to give you those figures.

Mr. Quie. Under that 1955 law, how can students in a rural community, where it would not be possible, perhaps, to have a special class, receive special education?

Mrs. Holecamp. I could not answer that, either. Maybe someone

that testifies later this afternoon or tomorrow can answer that.

Mr. Elliott. Thank you very much, Mrs. Holecamp. Are you on the legislative committee, Mrs. Holecamp?

Mrs. Holecamp. I am the chairman of the legislative committee for the State of Alabama Congress of Parents and Teachers.

Mr. Elliott. It seems as though you have been making a lot of

good progress this year.

Mrs. Holecamp. Thank you. You have, too.

Mr. Elliott. Thank you, ma'am.

Our next witness is Mr. J. M. Warren, president of the Tennessee Federation of the Blind, Inc., of Nashville, Tenn.

STATEMENT OF J. M. WARREN, PRESIDENT, TENNESSEE FEDERA-TION OF THE BLIND, INC., NASHVILLE, TENN.

Mr. Warren. Mr. Chairman and members of the subcommittee, for the record, my name is J. Marshall Warren. I reside at 100 South 16th Street, Nashville, Tenn. I am president of the Tennessee Federation of the Blind, an organization of blind men and women

throughout the State.

I am also chairman of the advisory committee, the committee that meets periodically with the department of welfare, the Tennessee Department of Public Welfare, to discuss problems that concern the program for the blind as that department administers it. This committee serves as close liaison between the blind and the officials of the department that administers the program for the well-being of the blind.

Although I have been totally blind since the age of 2, it has been possible for me to live a full, active life. For 15 years I conducted a country store and for the past 20 years I have been engaged in the mercantile business. For the past 20 years I have participated in real estate, buying and selling real estate, handling mortgages, repairing and building homes.

In conjunction with other activities, I share a major responsibility for the management and operation of a 600-acre dairy farm. Aside from my role in organizations of the blind and business activities, it has been my privilege to serve in the Tennessee Legislature.

I wish to commend this committee, Mr. Chairman, for its inquiry into programs for the blind, and its desire to improve those programs.

In my capacity as president of the Tennessee Federation of the Blind, for the time I have participated in the workshop in Atlanta, and for the time available to me, I wish to discuss the so-called independent-living bill.

The objectives sought in the enactment of this so-called independent-living bill are worthwhile. However, if the legislation of the type proposed, especially legislation of the type now pending before this committee, H.R. 3465, should be enacted without proper

safeguards, and disadvantages of such legislation probably would

outweigh any gains which might be realized from it.

For more than a year the controversy concerning the independentliving bill has raged throughout the country. Blind persons have more to gain or lose by the enactment of this legislation than perhaps any other group. Independent legislation as a part of the Vocational Rehabilitation Act would not only affect the unemployable blind person, it would affect almost every vocational rehabilitation client in one way or another.

Many services to the blind are now considered as being within the scope of this vocational rehabilitation. It would provide many of those services not now provided. This means that home teachers, for example, who are paid entirely from State funds, except in those rare instances where the home teacher works with a vocational rehabilitation client, the time spent in such work can be charged against vocational rehabilitation case service funds, but the redtape and the recordkeeping involved are so cumbersome that many States do not take the trouble to claim Federal reimbursement. The result is that salaries and standards in the field of home teaching are far below those in rehabilitation.

It is not difficult to see why this is so. If a State gets two Federal dollars for every State dollar that it puts into the salary of a vocational rehabilitation counselor, it can pay that counselor \$5,150 for a total investment of only \$1,700 of State money. Thus it will cost the State more to hire a lone teacher at \$3,000 than to hire a rehabilitation

counselor at \$6,000.

If the independent living bill were enacted, home teachers' salaries would undoubtedly come within the scope of the legislation. Both salaries and standards would improve, and a broader program of services would be made available to the blind. This would be a clear gain and much to be desired.

On the other hand, the independent-living bill as it now stands would further complicate and confuse vocational rehabilitation services for the blind. It would likely mean that fewer blind persons

would be placed in competitive employment.

The independent living bill is a logical outgrowth to the 1954 amendments to the Vocational Rehabilitation Act. Before 1954, the emphasis in rehabilitation was on vocational training and job placement. The Federal regulations were so drawn that considerable incentive was given to the States to place disabled persons in competitive

employment.

The 1959 amendments passed placed the emphasis on physical restoration and what has been called medical rehabilitation. The Federal regulations were changed to reflect this new emphasis. The term "remunerative occupation" was defined to mean employment in the competitive labor market, practice of a profession, self-employment, homemaking, farm or family work, including work for which payment was in kind rather than in cash, sheltered employment and home industries or other homework of a remunerative nature.

A State could, and still can, claim a vocational rehabilitation closure on a person making 10 cents an hour, making no salary at all, drawing no public assistance when the State public assistance took

its case, making potholders, or returning home to sit in an armchair

following a cataract operation, a family worker.

Since rehabilitation of this type is counted remunerative employment, as rehabilitation involving the more difficult task of placing disabled persons in competitive employment, the incentive is to make these easier placements.

If the independent living bill should be enacted, without substantial changes, it would continue the trend which was begun in 1954. Agencies for the blind would probably further deemphasize their job hunting and placement activities, and would spend even more time testing, giving physical restoration services, counseling diagnostic work, and to specially helping the blind client to achieve independent living, but not a job.

The 1954 amendments to the Vocational Rehabilitation Act, as well as the proposed independent living amendments, point up the differences between vocational rehabilitation of the blind and voca-

tional rehabilitation of other disabled persons.

The blind, of course, comprise only a small fraction of the total number of disabled people in the Nation. Therefore, administrative planning and program emphasis at the Federal level in those States having no special vocational rehabilitation agency for the blind, are usually in terms of social group, not in terms of the special needs of the blind.

Mr. Elliott. Mr. Warren, let me interrupt you there.

We have used our customary 10 minutes, but I will give you 2 or 3 minutes additional to finish whatever you may care to say orally. Then I will make it possible for your entire statement to be placed into the record following your oral statement.

Will it be possible for you to furnish us a copy of your statement

in full at some future date?

Mr. Warren. We will do that, Mr. Chairman, yes. Mr. Elliott. You take 2 or 3 minutes to finish what you desire to sav.

Mr. Warren. I would like to say this, Mr. Chairman: There are a lot of benefits provided in this independent living bill. The point that we want to make is that we want those benefits for the blind, but we do not want to give up the one important thing to a blind person, and that is training and placement in competitive employment, where he can earn his living.

My conception of an independent living is a living that he earns himself and not something that is handed out to him. These benefits that this bill would provide should not be administered by the same agency. If they are administered by the same agency they should not

be administered by the same personnel.

We want the emphasis in vocational rehabilitation for the blind placed on training the individual and helping him get to a place to earn his living. Provide all these other benefits, but place them not under the Division of Rehabilitation. Probably they are more nearly social and health benefits than they are vocational rehabilitation services.

I think with the filing of this statement, you will get an idea of what we have in mind.

Mr. Elliott. Thank you very much, Mr. Warren.

Are there questions of Mr. Warren?

Mrs. Green. I have one question of Mr. Warren.

The point that you raised in the objection to putting the care of the help to the blind under vocational rehabilitation, this question has been raised in my own State. Is this a national trend? Is there an effort being made to do this in every area?

Mr. Warren. Well, it seems if you want a perfectly frank answer, that will make it a good deal easier on vocational people, because their closures can be made before they have secured a job for a client.

It seems that this bill, I guess, has the support of the rehabilitation

folks of the Nation.

Mrs. Green. There is a very good reason in my own State and I wondered if this is true in other areas, that vocational rehabilitation has offices in very many areas of Oregon. We have 36 counties and it is a rather good size State geographically. Therefore, they can give better service to the individual. There are not so many offices for the blind. It becomes necessary for them to transport an individual maybe 300 miles. But if it was under vocational rehabilitation, it might be necessary to transport that individual 10 miles.

Mr. Warren. We maintain that vocational rehabilitation for the blind should always be administered by a separate agency or division, or separate personnel, rather than administered by the agency or division that administers general rehabilitation, rehabilitation for other

handicapped persons.

It is more difficult to rehabilitate blind people than it is a lot of other disabled persons, and the blind are neglected because they take the pattern of least resistance, and their attention is centered more on the easier client to rehabilitate.

Mrs. Green. But if we insist on this, will the blind actually be more inclined or will there be a greater possibility of his being neglected

because the services are not available in his area?

Mr. Warren. In our State, in Tennessee, and I believe in 30-some-odd States—I am not sure about that figure, however—the vocational services for the blind are separate from the general rehabilitation services, services for all other handicapped groups. We have them separate.

The vocational services in Tennessee are part of the division of services for the blind, and the other vocational services for the other

groups is in the department of education.

Does that sort of answer your question?

Mrs. Green. Yes.

I still am not sure. They are separate in Oregon, of course, too, but I am not sure but what more services would be available if they were combined just because of the offices and the number of people involved.

Mr. Warren. That has been tried out.

In the beginning they were together, and they found that it did not work well to rehabilitate the blind, having them together. For that reason they were separated.

Mrs. Green. Thank you.

Mr. Elliott. Thank you, Mr. Warren.

(Mr. Warren's statement follows:)

STATEMENT OF J. MARSHALL WARREN, PRESIDENT, TENNESSEE FEDERATION OF THE BLIND, INC., NASHVILLE, TENN.

Mr. Chairman and members of the Subcommittee on Special Education, my mane is J. Marshall Warren and I reside at 100 South 16th Street, Nashville, Tenn. I am the president of the Tennessee Federation of the Blind, a statewide organization of blind men and women. I am also the chairman of the Advisory Committee of the Blind. This committee meets periodically to consult and advise with officials of the State department of public welfare. It provides a close liaison between the blind and those who administer programs for their aid and rehabilitation.

Although I have been totally blind since the age of 2, it has not precluded my living a full, active life. I operated a country store for 15 years and since 1920, I have been engaged continuously in the mercantile business. For the past 20 years I have been fortunate enough to succeed in the real estate business, including buying and selling property as well as handling mortgages and residential construction and repair. In conjunction with other activities I share major responsibility for management and operation of a 600-acre dairy farm. Aside from my role in organizations of the blind and business activities, it has been my privilege to serve in Tennessee's Legislature.

Mr. Chairman, I wish to commend this subcommittee for its searching inquiry into the programs for the blind and its desire to improve these programs. I wish to commend the subcommittee particularly for the leadership which it is providing in terms of consultation with representatives of organizations of the blind in the conduct of its special study. In my capacity as president of the Tennessee Federation of the Blind I participated in the Atlanta workshop sessions on the visually impaired and I appreciated the opportunity to do so.

In the brief period of time available to me, however, I wish to discuss the "independent living rehabilitation" bill now pending before the subcommittee.

INDEPENDENT LIVING REHABILITATION

The objective which is sought by the enactment of independent living legislation is extremely worthwhile; however, if legislation of the type proposed especially legislation of the type now pending before this committee (H.R. 3465) should be enacted without proper safeguards, the disadvantages of such legislation would probably outweigh any gains which might be realized from it. For more than a year the controversy concerning the independent living bill has raged throughout the country. Blind persons have more to gain or lose by the enactment of this legislation than perhaps almost any other group. Independent living legislation as a part of the Vocational Rehabilitation Act would not only affect the unemployable blind person, it would affect almost every vocational rehabilitation client in one way or another. Many services to the blind are not now considered as coming within the scope of vocational rehabilitation. means that home teachers, for example, must be paid entirely from State funds, except in those instances where the home teacher works with the vocational rehabilitation client. The time spent in such work can be charged against vocational rehabilitation case service funds, but the redtape and recordkeeping involved are so cumbersome that many States do not take the trouble to claim the Federal reimbursement. The result is that salaries and standards in the field of home teaching are far below those in rehabilitation. It is not difficult to see why this is so. If a State gets \$2 Federal for every State dollar that it puts into the salary of a vocational rehabilitation counselor, it can pay that counselor \$5,100 for a total investment of \$1,700 of State money. Thus, it will cost the State more to hire a home teacher at \$3,000 than a vocational rehabilitation counselor at \$6,000. If the independent living bill were enacted, home teaching salaries would undoubtedly come within the scope of the legislation. Both salaries and standards would improve, and a broader program of services would be made available to the blind. This would be a clear gain and much to be desired.

On the other hand, the independent living bill as it now stands would further complicate and confuse vocational rehabilitation services for the blind. It would likely mean that fewer blind persons would be placed in competitive employment.

The independent living bill is a logical outgrowth of the 1954 amendments to the Vocational Rehabilitation Act. Before 1954 the emphasis in rehabilitation was on vocational training and job placement. The Federal regulations were so drawn that considerable incentive was given to the States to place disabled persons in competitive employment. The 1954 amendments as passed placed the emphasis on physical restoration and what has been called medical rehabilita-The Federal regulations were changed to reflect this new emphasis. The term "remunerative occupation" was defined to mean (subpt. A, 401.1p) "employment in the competitive labor market; practice of a profession; self-employment; homemaking, farm or family work (including work for which payment is in kind rather than in eash); sheltered employment; and home industries or other homebound work of a remunerative nature." A State could, and still can, claim a vocational rehabilitation closure on a person making 10 cents an hour, making no salary at all, drawing more public assistance than when the State rehabilitation agency took his case, making potholders, or returning home to sit in an armchair (a family worker) after having been operated on for a cataract. Since rehabilitations of this type are counter as closed, remuneratively employed, as are rehabilitations involving the more difficult task of placing disabled persons in competitive employment, the incentive is to make these easier placements.

If the independent living bill should be enacted without substantial changes, it would continue the trend which was begun in 1954. Agencies for the blind would probably further deemphasize their job hunting and placement activities and would spend even more time testing, giving physical restoration services, counseling, doing diagnostic work, and (most especially) helping the blind client

to achieve independent living—but not a job.

The 1954 amendments to the Vocational Rehabilitation Act and the proposed independent living amendments point up the difference between vocational rehabilitation of the blind and vocational rehabilitation of other disabled persons. The blind, of course, comprise only a small fraction of the total number of disabled people in the Nation. Therefore, administrative planning and program emphasis at the Federal level and in those States having no special vocational rehabilitation agency for the blind are usually in terms of the total group, not

in terms of the special needs of the blind.

The rehabilitation of the average disabled person usually involves medical work or some type of physical therapy—learning to use prosthetic devices, learning to walk or use muscles after polio, developing motor coordination, learning to live with one's limitations after a heart attack, correcting a speech defect, or learning to use a hearing aid or brace. In short, rehabilitation for the average disabled person who is not blind usually means physical restoration in one form or another, or some related process. When rehabilitation is viewed in this light, the 1954 amendments and the present independent living legislation are logical next steps. Increasing stress is placed upon diagnosis, medical services, therapy and physical restoration. Vocational rehabilitation services and hospital services are beginning to be regarded as related parts of one overall process. The

disabled person is more and more thought of as a patient.

Rehabilitation of the blind, on the other hand, is something else again. The average blind person in need of rehabilitation does not have a health problem. He is not sick. He does not need physical restoration. Lenses will not help He cannot be taught new techniques for using his eyes. His needs are entirely different from those of the patient. He must have help in adjusting to his blindness. He must come to an understanding of the fact that it need not keep him from doing the things he has always done. He must have training in skills and techniques-independent travel, braille and typing, etc.; above all, he must have help in finding a job. The average blind man, just as the average sighted man, is not a good salesman. He needs a vocational rehabilitation placement man to help him convince an employer that he can do a job. Considered in these terms, the 1954 amendments did not advance rehabilitation of the blind. Nor, as now drawn, would the independent living bill do so. Medical help and physical restoration are vitally important services. They are necessary for the blind as well as other groups. The question is not their importance, but by whom they should be administered, what emphasis they should receive, and what their relationship is to vocational rehabilitation.

In view of the foregoing comments the following specific proposals are made: (1) Public Law 565 should be amended so as to provide for Federal matching funds as grants in aid to the States for home teaching programs for the blind,

regardless of what department of State government administers such program. The Federal share of the cost of the home teaching program should be the same

as the Federal share for the State under section 2 of Public Law 565.

(2) If the independent living bill (H.R. 3465) or any similar legislation is enacted, any agency of State government should be permitted to administer the independent living program. If the independent living program for the blind is administered by a State agency which also administers to program of vocational rehabilitation for the blind, the personnel (other than administrative) engaged in the day-to-day operation of one program should not be permitted to spend any time working in the other program.

(3) Public Law 565 should be amended to require changes in the reporting systems of the State agencies doing rehabilitation of the blind, and in the reporting system of the Federal Office of Vocational Rehabilitation a more realistic definition of "remunerative employment" should be established, and a clear differential of the control of the control

ferentiation should be made between types of rehabilitation closures.

(4) The services contemplated under the independent living legislation are greatly needed to promote the general welfare of the blind, but they should be regarded more as health, welfare, and medical services than as rehabilitation, and they should be so planned and administered as not to weaken or water down the program of helping the blind to achieve regular, competitive employment.

I thank you.

Mr. Elliott. Our next witness is Mrs. Christie W. Summers, of

Jasper, Ala.

Mrs. Summers is the director of our school in Jasper, Ala., that offers special educational facilities and training to the mentally retarded, and perhaps other groups of disabled children.

Will you give your exact title, Mrs. Summers?

STATEMENT OF MRS. CHRISTIE W. SUMMERS, JASPER, ALA.

Mrs. Summers. I would like to say to the Honorable Carl Elliott and members of the committee that I feel it is a privilege to be with you today. I want to commend you on what you have done and what you are doing for us, in the interest of education.

Mr. Elliott. We are happy to have you. It is a pleasure for all of us, too, to work in the field of education with one as competent and

determined as you are.

Mrs. Summers. I am going to be very brief and tell you what I think are the emergencies. I am speaking as an individual now,

please.

Some of our most urgent needs in the southern region in the field of special education and reliabilitation are as follows: More and better trained personnel, evaluation centers, and research. I did not put them in order. I merely am making a statement.

Every child is entitled to an opportunity for education and employment appropriate to his physical and mental abilities or possi-

bilities by just being born an American.

Mr. Elliott. That is his birthright, isn't it?

Mrs. Summers. That is his birthright. The cerebral-palsied child is no exception. Cerebral palsy is a southern problem, but not pe-

culiar to the South. It is a national problem, too.

Dr. Winthrop Fields has stated in his latest book that there is a national incidence of 7 per 100,000 in our general population. Walker County has per capita far more handicapped people than any other county in Alabama; 555 handicapped children are in Walker County, under 16, with a general population of 63,769. I

have no definite figures to submit to you, but from the figures I do have, I can truthfully say we have a greater incidence of cerebral

palsy in Walker County than the national incidence.

The cost of education, treatment, and training in occupational skills for a cerebral-palsied child is prohibitive for most families and communities who have cerebral palsy in their midst. It is true that adequate research is lacking, too, for the same reason.

Of course, our per capita income in the South is the lowest in the Nation, I believe. Cerebral palsy is a group with which I am most concerned, but what I am going to say will apply to other handicaps as well. It is better to prevent welfare cases than to pay the price

welfare will cost taxpayers.

According to rehabilitation statistics, \$1 invested in rehabilitation services will bring back \$10. The profit may be less with cerebral palsy, but there will be a profit, nevertheless, if adequate services are

provided for them at an early age.

A weakness in most cerebral palsy programs is the failure to evaluate all of a child's abilities that may be built upon to train him for eventual employment and economic security. This is true in the South, but is not peculiar to us, either. The weakness may be due to ignorance on the part of the parents of the service he provided, but most assuredly it is due to the inadequate number of trained workers and so few training or treatment facilities.

Our program has grown by leaps and bounds in 10 years and is much worthy of being called a program for exceptional children, since Mrs. Alpha Brown has become consultant for special education

3 years ago.

The program now needs to be strengthened by including physical, occupational, speech therapists, as well as psychologists and specially trained teachers on the State staff, for the extent to which a cerebral palsied child succeeds in life's situations depends a great deal upon the facilities which are available for understanding and guiding him during his early years of life. Furthermore, his interests and his attitudes toward his community are directly dependent upon such a program as is provided.

More field clinics for diagnostic and treatment purposes adequately staffed by well-trained persons are required and needed badly in the South. They may be of a mobile nature, but must work closely with the community, the school, and the home for early diagnostic treat-

ment and vocational training.

I hold that vocational training begins right in infancy so that the cerebral palsied child will be ready for further evaluation or training in a center or for on-the-job training program. There is no suitable evaluation center in our area at present. In Birmingham one is being attempted. Miss Stewart, who is well qualified as an occupational

therapist, feels she is meeting with success.

She told a group of workers of the physically handicapped last Thursday that such centers were a crucial need in order that rehabilitation could place cerebral palsies in jobs, for CP's, more than any other handicapped persons, are difficult to place because of the complication of their handicaps and the lack of acceptance on the part of the public.

It may not be feasible to establish a strictly CP sheltered workshop. If not, a generic sheltered workshop might be the answer. Until adequate, objective data can be obtained, the type of sheltered workshop established must necessarily be left to the judgment of those experi-

enced in that field.

In Jasper, with our older cerebral palsied children, some 6 years ago we had to use any means available to place them in jobs, so on-the-job training was required. We worked closely with the State rehabilitation services and met with success. It is my opinion that the conversion of the present human waste materials, and that is what the public's view of cerebral palsy is, to have rehabilitated, self-employed, taxpaying citizens, can be accomplished only if money is available to train the needed team of workers and to help establish facilities and long-needed research for this purpose.

This education cannot be financed on a crumbs-from-the-table basis, either. It is not money to be termed charity, because charity is a luxury which the American Government today cannot afford, but a money investment in all exceptional services, so that the Nation itself

will not suffer an economic loss.

Thank you.

Mr. Elliott. Mrs. Summers, on behalf of the committee, I want to thank you for that fine statement, and thank you also for the fine work that you do every day as you labor in this endeavor. I am happy that you are getting a new school building for your work. When will it be ready?

Mrs. Summers. We would move in this week, but I have to be out

of town on Friday so we will move in the first of next week.
Mr. Elliott. That is wonderful. Thank you very much.

I note that we have in our audience today Mrs. Bob Sherer, Sr., and Mrs. Bernice Youngblood, both from my home town of Jasper, Ala. Mrs. Youngblood also reflects honor on our district as chairman of the

State Library Board of Alabama.
We are happy to have you Mrs. Sherer, and Mrs. Youngblood.
Now may I call again Mr. Milton K. Cummings. Has Mr. Cum-

mings arrived vet?

If not, this brings us to our luncheon point. We will reconvene at 1:30 this afternoon. We will begin with the first witness being Mr. Cummings, if he arrives. If not, our first witness this afternoon will be Mr. Percy M. Sessions.

(Whereupon, at 12:35 p.m., the subcommittee recessed, to recon-

vene at 1:30 p.m. the same day.)

AFTER RECESS

(The subcommittee reconvened a 1:30 p.m., Hon. Carl Elliott, chairman of the subcommittee, presiding.)

Mr. Elliott. The subcommittee will be in order.

The first witness this afternoon is Mr. Percy M. Sessions, chief psychiatric social worker, Alcoholism Clinic, Birmingham, Ala.

While Mr. Sessions is coming forward, let me say that our subcommittee is very appreciative today and will be so tomorrow for the fine service that Floyd Lawson, district supervisor of the Decatur Office of Vocational Rehabilitation, is rendering and has rendered to the success of our hearings. Mr. Lawson is accompanied here today by Leslie J. Waller, supervisor of the Physical Restoration Services, Division of Crippled Children and Rehabilitation, State of Alabama. Les Waller is a graduate of the Cullman High School and is at home today.

Mr. Lawson is also accompanied by Mr. George L. Hurt, area supervisor of the office of rehabilitation; accompanied by Mr. Holmes A. Turner, area supervisor of the rehabilitation service, Decatur office, and by Mr. Craig Mills, of the rehabilitation service in Florida.

May I say to you gentlemen that the committee appreciates your deep interest and the fine service you render in helping make these

hearings possible.

Mr. Sessions, we are happy to have you and look forward to your testimony. I regret that we must impose a 10-minute limitation on the testimony of each witness. With that in mind, you may proceed.

STATEMENT OF PERCY M. SESSIONS, CHIEF PSYCHIATRIC SOCIAL WORKER, ALCOHOLISM CLINIC, BIRMINGHAM, ALA.

Mr. Sessions. Mr. Chairman, and members of the committee, this testimony is presented on behalf of a vast number of handicapped people in the South and throughout the Nation—handicapped people who have been championed much less frequently than they have been morally judged and condemned. These are handicapped people for whom special education and rehabilitation are the treatments of choice both for humanitarian considerations and for the practical benefits reasonably expected to accrue therefrom.

These people are handicapped for the reason that they suffer from an overwhelming compulsion to drink alcoholic beverages. They are

alcoholics.

Practically, the alcoholic may be defined as any person who ultimately derives less pleasure and satisfaction than misery and suffering from his consumption of alcoholic beverages but who, nevertheless, has a compulsion to imbibe.

Mr. Elliott. Where does that compulsion originate, Mr. Sessions?

What is the basis of it?

Mr. Sessions. The experiences of the individual, and during the formational years of his childhood. That is the ultimate origin. But there are ever-accruing causes for the illness on up to the time of its appearance. Then there are causes for its aggravation thereafter.

Mr. Elliott. You regard it as an illness?

Mr. Sessions. Definitely. Obviously, such a compulsion must rest upon a desire for punishment of the self. Such a desire for self-punishment, in turn, must grow out of feelings of guilt and self-dis-

paragement.

Clinical experience has established the fact that these feelings of guilt and self-disparagement are not often supported with logic or reality but are essentially pathological in nature and are derived usually from misguided, overcontrolling, hostile, rejecting, condemning, and disparaging social attitudes to which the alcoholic has been subjected. Usually it was during the formational years of his child-hood that he first experienced these feelings directed toward him, and when the symptoms of alcoholism appear as a result of the individual's accepting as his own these appraisals of himself, the social attitudes

toward him which made him ill in the first place are now magnified, and they confirm him in his course of suicide on the installment plan. For the alcoholic, drinking amounts to this. He says to himself in effect, "I am a miserable wretch. I should die."

Instead of trying to dissuade him from such a conviction and result-

ing course of action, society simply echoes, "You are a miserable

wretch. You should die."

Rehabilitation of the alcoholic depends upon his reeducation. depends upon his being led to reevaluate himself and his inner resources so that he can acquire respect for both. Decisive results from such education are difficult to achieve for the reason that they must be

accomplished in a sort of social vacuum.

It is not easy for the alcoholic to respect himself because self-respect thrives best when it is fed from sources lying beyond the individual's own personality. However, where the alcoholic is concerned, any positive self-regard he may develop is apt to be swept away in the floods of adverse attitudes flowing upon him from without. Alone, he cannot come about a more healthful concept of himself any more than he can lift himself by his own shoelaces.

The rehabilitation of the alcoholic, therefore, depends upon his having a source of self-esteem beyond the realm of his own personality. Special education provides this source. A program of special education constitutes evidence that not all of our society has despaired of

The program itself is proof that people believe him to be worth The special educators or therapists can demonstrate in a personal way their own esteem for him, thus helping him to disregard the adverse, condemning, and depreciating attitudes which hover around him in his social situation. What others say of him or how they feel toward him becomes less devastating in the face of the positive program of special education.

In Alabama, there are from 40,000 to 50,000 alcoholics and from 120,000 to 200,000 individuals personally involved and deprived be-

cause of the illness of these people.

Throughout the Nation there are an estimated 5 million alcoholics and from 15 million to 20 million persons seriously involved and deprived.

The need for programs of special education and rehabilitation is made obvious from the above estimates and from the effectiveness of

such programs, as demonstrated in various States.

In Alabama, the demonstrations have taken place in two clinics which are functioning under the auspices of the Alabama Commission on Alcoholism. Therapy administered in these clinics consists mainly of special education of the alcoholic and, whenever possible, of his relatives and acquaintances. As of September 30, 1959, a very high proportion of patients completing treatment in these clinics were considered to have had their conditions improved or arrested.

Alcoholism is generally regarded as one of the foremost health problems of the Nation. Yet, it can be effectively treated by special education programs. Heretofore, primary responsibility for these programs has been assumed by the various States and this is perhaps as it should be. With the limited tax resources which are available to the States, however, it has not been easy for some of them to finance really adequate special education staff and facilities for effective programs. Indeed, some of the States, without Federal encouragement, have not progressed beyond programs of very general education with respect to alcoholism, and general education is not effective enough to restore alcoholics to social competence and vocational productivity.

Of not little importance is the alcoholic's need to realize that he is significant enough for the Nation to be concerned about him to the extent that the Congress of the United States assumes some responsibility for stimulating and perhaps coordinating the efforts of the

various States to provide rehabilitation programs for him.

Prejudice against the acceptance of the alcoholic as a genuinely sick person, easily mouthed slogans to the contrary notwithstanding, is so widespread as even to permeate the ranks of professional people, with the result that the range of professional persons available to reeducate or to treat alcoholics is somewhat restricted even beyond the point to which they are restricted for other educational and thera-

peutic endeavors.

The State of Alabama has taken practical action to overcome this handicap by making available limited funds for the professional training of carefully selected persons to assume responsibilities for the reeducation or treatment of alcoholics. Of course, these persons cannot be kept within this State. The individual accepting a training stipend is morally obligated to work for a limited time within the State, but thereafter the probability is that he will be attracted to superior salaries elsewhere.

Therefore, this subcommittee might wish to consider the possibility of recommending to the Congress of the United States that some step be taken to encourage all the States to adopt training programs similar to that which is administered by the Alabama Com-

mission on Alcoholism.

It is likely that through both general and special education combined with an adequate program of treatment, the profound and widespread problem of alcoholism can be diminished very much as the problem of tuberculosis has been diminished. However, it cannot be done with timid and halfhearted measures. Neither can it be done unless the States combine their efforts to launch a giant program on a nationwide basis.

Perhaps this subcommittee will be able to devise ways of encouraging the development of such a program while at the same time leaving responsibility for the local programs primarily in the hands of

the various States.

Thank you.

Mr. Elliott. Thank you very much, Mr. Sessions. I wonder, Mr. Sessions, if you might be willing to extend your remarks, to send us additional memoranda in writing, giving the range of the Alabama program for alcoholism and some of the details about it.

Mr. Sessions. I will be happy to do so.

Mr. Elliott. Your testimony has been very impressive, so far as I am concerned, and I thank you.

Mrs. Green. I know the time limit, Mr. Chairman, but we have heard about the dearth of trained personnel in these other fields.

I notice by the paper that you are a psychiatric social worker. How many trained psychiatric social workers are there, for instance, in Alabama, where you do have a program? Mr. Sessions. Are you asking about the total number of trained psychiatric social workers in the State or those employed by our commission?

Mrs. Green. I would like first the total number that would work in

the schools and other areas.

Mr. Sessions. Being a relative newcomer to the State of Alabama, I am afraid I am not able to make a very reliable estimate regarding the total number in the State. I would guess it to be something like 20. There are more trained social workers, but probably something like that with the psychiatric sequence.

Mrs. Green. How many trained psychiatrists are there? Do you

have an idea on that?

Mr. Sessions. No; I don't.

Mrs. Green. And you have 40,000 to 50,000 alcoholics in the State?

Mr. Sessions. Yes.

Mrs. Green. Then here is another area where the problem is really personnel?

Mr. Sessions. That is absolutely true.

Mrs. Green. You spoke that the commission apparently has a training program, and they go to other States where salaries may be higher. What is the salary that Alabama could offer in this area?

Mr. Sessions. The commission has also attempted to remedy our handicap with respect to the acquirement of personnel by having a somewhat more liberal salary than is usually found within the State. The beginning salary for a fully trained psychiatric social worker is \$6,000 a year. Unfortunately, we don't have much upward range from there.

If a person works 10 years, he may acquire \$1,500 a year more than that, this after the individual has had 2 years of graduate training in

a school of social work.

Six thousand dollars a year represents not too good a return on his investment of time. But as compared with other social workers' salaries within the State of Alabama, it is very good.

Mrs. Green. You refer to the high percentage of cases that were improved, or where the alcoholism was stopped. What percentage is

that, the one that you were speaking about?

Mr. Sessions. The last time we did a little research with respect to our Birmingham clinic, among those patients who had completed the treatment, 78 percent had been considered either improved or were considered to have had their conditions arrested. Of course, these

terms are subject to definitions.

In order for us to have considered the person to have had his condition arrested, it would have been necessary for him to have been completely abstinent from alcoholic beverages for a period of at least 6 months and to have shown marked progress also in the areas of interpersonal relationships and vocational adjustments if at the time he came to our clinic progress and vocational adjustment were indicated as being needed.

If we close the case not as having this condition arrested but simply as having improved, it was necessary for him to have been totally abstinent for an impressive period up to or over 6 months, or maybe somewhat less than 6 months but not much less than that, and he might

not have shown the marked improvements in other areas to which I referred.

Mrs. Green. Thank you.

Mr. Elliott. Thank you very much.

Our next witness is John S. Prickett, Jr., assistant director, rehabilitation services, Atlanta, Ga.

STATEMENT OF JOHN S. PRICKETT, JR., ASSISTANT DIRECTOR, REHABILITATION SERVICES, ATLANTA, GA.

Mr. Prickett. Mr. Chairman and members of the committee, Dr. A. P. Jarrell, our State director, was invited to testify before your committee, but due to recent illness and upon the advice of his doctors, he was not able to come. He wrote Mr. Elliott, asking that I testify in his stead. I have a statement from him.

Mr. Chairman, and members of the subcommittee; it is a high privilege to appear before this distinguished committee on behalf of disabled people who need help in achieving economic and social inde-

pendence.

At the outset I would like to say that vocational rehabilitation forces in Georgia endorse the provision of the pending bill to expand the services now provided under the joint Federal-State program; namely, H.R. 3465.

We also endorse House Joint Resolution 494.

The Georgia Rehabilitation Association, representing nearly 1,000 professional workers and lay people, recently passed a resolution supporting the provision of H.R. 3465. A letter reporting this action was sent to the chairman of your committee.

As to the need for such legislation, may I briefly outline the situation

in our State.

During the past 5 years, more than 26,000 disabled civilians have been restored to productive jobs through the services of the joint Federal-State program of vocational rehabilitation. There has been a steady increase, year by year, in the number of rehabilitations for the past 10 years. Throughout a 5-year period, we have provided services to nearly 12,000 disabled persons annually.

At the end of the fiscal year 1958-59, there were 5,938 cases on the active rolls, still receiving services, and there were 8,450 applications

for services awaiting investigation.

Moreover, there are thousands of other seriously disabled people who need services, which we are unable to provide because of the lack of funds, facilities, trained personnel, and because of legal restrictions.

The Office of Vocational Rehabilitation estimates that there are in the Nation about 2 million disabled persons who need vocational rehabilitation services and 250,000 annually who are becoming disabled. On this basis it is estimated that there are about 30,000 disabled people in need of vocational rehabilitation services in Georgia.

Under the support program, Georgia received \$2,222,889 of Federal funds during fiscal 1959. The State spent \$1,450,416 for the program, which was \$219,164 more than the amount required to match Federal funds. This year, 1959-60, we have nearly \$200,000 of State funds in

excess of the amount required to match Federal funds.

As pointed out in our letter of June 22, 1959, to the chairman of this subcommittee, Georgia appropriates on a per capita basis more funds for vocational rehabilitation services than any other State in the Nation. There are several other States which are appropriating more funds than OVR can match under the present formula.

Therefore, we should respectfully urge that the allotment base be increased at least in an amount sufficient to give these States enough

Federal funds to match the State funds available.

From our study of the formula for the distribution of funds for the support program, an allotment base of approximately \$85 million would be required. This would enable these States to expand their

programs in vital fields.

We are hopeful that Congress will see fit to amend section 3 of Public Law 565 so as to permit the transfer of extension and improvement grants from those States which are unable to use them to States which have sufficient funds to activate projects under this section. This proposed change in the law would be helpful to the States which

are financing adequately their part of the program.

Georgia is undertaking a tremendous expansion of its mental health program. It involves an expansion of facilities, staff, and services at the State hospital, a new hospital for the mentally ill in Atlanta, together with five additional treatment hospitals, similar to that now in operation at Augusta, Ga. The cost is estimated at \$15 million above that which is now being spent for the treatment of the mentally ill

The Georgia rehabilitation agency is cooperating with the State department of public health and the State department of public welfare, hospitals, and other agencies in developing a coordinated rehabilitation program for mentally ill, emotionally disturbed, and mentally

retarded persons.

Our counselors work with teams of specialists at several hospitals in planning rehabilitation services for mental patients and epileptics who ultimately may be returned to employment.

As the mental health program expands, additional counselors will

be needed for this specialized service.

For the fiscal year 1958–59, the agency rehabilitated only 137 mentally ill persons. Currently we are providing rehabilitation services to about 400 individuals whose disability has been diagnosed as emotionally disturbed. The mental health program has the backing of the Governor, the legislature, and the citizens generally. It will offer a great opportunity and challenge to the rehabilitation agency to provide rehabilitation services to patients from these hospitals and centers. But more money will be required.

If more funds were available, we are confident that we could increase the number of rehabilitated patients among persons with

mental handicaps threefold in the next 2 years.

I am of the opinion that H.R. 3465 represents a logical and constructive step in the development of the Nation's rehabilitation services. Year after year we are compelled to decline services to thousands of applicants who do not have the rehabilitation potential to qualify under the present law. Many of these people, we are certain, could be restored to some degree of self-sufficiency as envisioned under H.R. 3465, the independent living and rehabilitation measure.

As evidence of Georgia's interest in independent living reliabilitation, the general assembly at its 1959 session amended the State rehabilitation law to authorize this type of service. We are planning to put this measure into effect when appropriate Federal legislation

is passed and Federal funds become available.

In Georgia there is a pressing need for more workshops and vocationally oriented rehabilitation facilities to serve more of the mentally ill, epileptics, mentally retarded, blind, deaf, cerebral palsy, and other seriously disabled individuals. There is a great need, especially, for work evaluation and diagnostic units within both rehabilitation facilities and sheltered workshops.

With such facilities we could rehabilitate many borderline cases which now are neither ready for rehabilitation schools nor competitive employment. This situation is another reason for our strong

endorsement of H.R. 3465.

In Georgia, the school for the deaf is a unit of the vocational rehabilitation division. We know from long experience that it is difficult, if not impossible, to get specially trained teachers of the deaf to staff this school.

During the past 10 years, enrollment there has increased from 291 to 427, which shows the increasing need of well-qualified teachers.

Of scarcely less importance is the pressing, urgent need for psychologists, social workers, counselors, and other personnel. The ability of these professional workers to serve the deaf is seriously limited because of the lack of special training necessary for evaluating and meeting their needs. We know, too, that there is a shortage of trained audiologists and speech pathologists in the private agencies from whom we purchase services for our clients.

Frequently our clients with hearing and speech impediments are compelled to wait for weeks before appointments at these centers can be made. Enactment of House Joint Resolution 494 would in time help materially in remedying this shortage of trained personnel in

this field.

We should be glad to have any members of this subcommittee or your colleagues in Congress visit Georgia and observe the operation

of our vocational rehabilitation program.

I thank you, ladies and gentlemen, for the opportunity of appearing here today. If there are any questions, I would be glad to attempt to answer them.

Mr. Elliott. Thank you very much, Mr. Prickett.

If there are no questions, we will give you our thanks, Mr. Prickett,

for a fine statement.

May I at this point recognize the fact that Dr. E. A. McBride, president of the Alabama Institute for the Deaf and Blind at Talladega, Ala., is present, and to say to him that we appreciate his presence.

Do you care to say anything, Dr. McBride.

STATEMENT OF E. A. McBRIDE, PRESIDENT, ALABAMA INSTITUTE FOR THE DEAF AND BLIND, TALLADEGA, ALA.

Mr. McBride. I do not want to take up the time of the people who have been invited here to testify. The testimony they have given fits our case exactly.

We are short of trained personnel, both as teachers for the deaf, counselors for the blind, and counselors for the deaf.

Dr. Ainsworth will bring our report from the 2-day meeting in

 ${f A}$ tlanta.

Mr. Elliott. Thank you, Dr. McBride.

Also, I am happy to recognize the fact that members of a sociology class from Sacred Heart College of Cullman, Ala., are with us this afternoon, accompanied by their instructor, Sister Jerome, and Sister Martina, the principal of the Sacred Heart Academy.

May I also recognize the fact that Mrs. Jewell Davis, the tax as-

sessor of this county, is with us this afternoon.

Mr. Raymond Higdon, tax collector of this county has also been with us today.

Our next witness is Mrs. Lillian R. Jones, State school for the

deaf, Baton Rouge, La.

Mrs. Jones, you may proceed with our usual time limitation of 10 minutes.

STATEMENT OF MRS. LILLIAN R. JONES, STATE SCHOOL FOR THE DEAF, BATON ROUGE, LA.

Mrs. Jones. Mr. Chairman, Senator Ellender and Senator Long wired Mr. Patton, the superintendent, last Wednesday, advising him of this hearing and asking him to attend or to send a representative. Mr. Patton himself was unable to attend and he sent me.

Both Senator Ellender and Senator Long knew of Mr. Patton's deep interest in the future education of deaf children, because of the present extreme difficulty in securing and retaining—

Mr. Elliott. May I interrupt you?

I see that Hubert Coker, president of the Alabama Welfare Society, twice president, is leaving. May I say to him that we are sorry the time has come that he has got to leave us. He is accompanied by Mrs. Geneva Thurman who, working with him and through the Veterans of Foreign Wars, has done so much to promote that phase of our handicap work in Alabama.

You may proceed.

Mrs. Jones. I am speaking primarily in behalf of the education of the deaf. In this area of special education, we are seeking no enlargement of the base of our operations, but we are deeply concerned in maintaining and improving the services which have been offered American deaf children for more than 150 years.

We see the grave possibilities of a serious decline in the quality

of these services because of the lack of trained personnel.

I have read reports which others have made to this committee and there is no need for me to go into the statistics which the others have previously given you. But the shortage, which is nationwide, is particularly acute in the South, because of the traditionally lower salary schedules.

In this regional hearing, may I tell you of our situation in

Louisiana?

The State school for the deaf in Baton Rouge is one of the medium sized of the southeastern schools for the deaf. It has an enrollment of around 310 and educational staff of 51. Our salary schedule

compares favorably with the salary schedules for most of the schools for the deaf in this region, but not one normally hearing teacher, trained or untrained, has applied for work in that school for the past

2 or 3 years.

Such normally hearing teacher replacements as we have been able to secure have been teachers who have been formerly on our teaching staff that we impressed into service again, or teachers that had retired from public school systems to rear families or for some other reason who wished to return to their public school teaching again. When we hear of such an interested teacher, whom we know to be competent, we try to interest them in making application for teaching in our school.

Over the past several years the Louisiana school has been able to add the services of only three qualified trained teachers of the deaf, qualified to teach oral and written communication skills, who were

not previously employed at the school.

One of these came to us because her husband was working on his doctorate in speech at the State university. Another retired from a northeastern school, came south looking for a warmer climate, and within 2 years moved yet further south. A third Mr. Patton was able to secure because this man's family was formerly a superintendent in that school.

As our teachers have retired or left for other schools, their places have been filled by urging former teachers in the school now living in the community to return to classroom work again. But this supply of trained local teachers is now exhausted. As teachers leave the Louisiana school at present, they are of necessity replaced by former teachers in the public school system, wholly untrained for this special

work, however in earnest they may be.

In-service training is attempted by an already overbusy staff. The children themselves are the losers. Until the more recent years, needed replacements have been few, and we have not had to employ many such teachers. But at present we are keenly conscious of the fact that there are no more trained teachers available to us, and many of our teachers are at present fast reaching the retirement age. Within the next 10 years, most of the trained teaching personnel which we now have will have been retired.

Our enrollment has increased over 10 percent this year, and most of this increase is in the beginning classes. This is an unusual situation for us, where we usually get a good many overage pupils, who cannot make the public school situation. The group of 30 small children we received this year will remain with us for 12 to 15 years, and we are considerably concerned over the possibility that they will not be as well taught as the pupils who had been formerly enrolled in

the school.

Without more trained teachers, the status of the deaf over the next generation will deteriorate immeasurably. With a good education, provided by qualified teachers, the deaf become self-respecting, self-supporting, taxpaying citizens, asking no special favors at the hands of the State. Indeed, as a national group, State by State in convenions 2 and 3 years ago the deaf rejected the idea of any special exemption on their income tax, an exemption that could have been added because of their hearing impairment. Half-educated or un-

educated, many of the deaf of the next generation would become welfare cases, wards of the State.

We feel that the legislation as proposed in your bill, Mr. Elliott, will make the optimum education available by providing the necessary

trained teachers.

May I thank you for giving me the opportunity for bringing this to your attention, and to express the hope that your efforts on behalf of the hearing impaired and the speech handicapped will bring into these areas the trained, well-qualified teachers and other personnel who are so badly needed.

Mr. Elliott. Thank you very much. Are there any questions?

Mrs. Green. You spoke of the low salaries, and you were not able to recruit the teachers you wanted. What is the beginning salary? Mrs. Jones. We work on the State minimum salary schedule. The

State fixes our salary. It is in the process of being implemented this

year.

Do you know, I do not have much to do with that in our school. am the principal. I can give you the figures from 1958, if you will

give me just a minute. I can furnish you that on request.

The position in our school is unusual, unfortunate, in that the teachers in the State schools are paid on the State minimum salary schedule, while the teachers in several of the Louisiana parishes are paid the minimum salaries plus an implementation that is paid by the local parish. We have parishes, not counties, in Louisiana.

I am sorry, but had I known you were going to ask that question, I

would have had the information available.

Mrs. Green. Would you rather submit it for the record? Mrs. Jones. Yes, I will be glad to do that.

Mis. Green. Fine.

(The information referred to follows:)

Requested salary schedules for certain teachers in Louisiana

	B.A. degree		M.A. degree	
	Minimum salary (no experience)	Maximum salary (12 years' experience)	Minimum salary (no experience)	Maximum salary (19 years' experience)
State school for the deaf: State minimum salary Parish (county) where State school is located: State	\$3, 250	\$5, 200	\$3, 425	\$6,000
minimum salary schedule plus across the board \$300 increment. Orleans Parish; ¹ State minimum salary schedule plus	3, 550	5, 500	3, 725	6, 300
increment (regular classroom teachers and teachers of special classes have same salary)	3, 490	5, 664	3, 818	6, 446
Caddo Parish: State minimum salary schedule plus in- crement	3, 650	5, 600	3, 825	6, 400
State minimum salary schedule plus increment plus differential for teachers of special classes	3, 925	5, 875	4, 100	6, 675

¹ Orleans Parish also pro-ides salary schedule for nondegree teachers who are 2-year normal school graduates on a temporary basis in this citegory, paying a minimum salary of \$3,340 for no years of service and a maximum salary of \$5,514 with 12 years service.

Mr. Quie. What kind of teachers do you have the most difficulty finding, the ones that teach shop and vocational courses, or the ones that teach your academic courses?

Mrs. Jones. The fact of the matter is that the vocational teachers, while we would prefer trained teachers of the deaf for that, most of their teaching is in the line of showing and they do not need the language training.

It is the oral teachers, the teachers qualified to teach speech and lipreading and keep the speech up, teaching the communicative skills.

The largest problem with the education of the deaf is the building of adequate means of communication at successively higher levels of integration. Our main trouble through the whole school, through any school for the deaf, the hardest problem, is the teaching of language, not speech or not reading.

Mr. Quie. The second question is this: Are there any classes for

the deaf in public schools in Louisiana?

Mrs. Jones. They have one in the New Orleans public school system

and they have two or three in the Shreveport situation.

The Shreveport situation started out rather large, but I believe has become rather small. The speech and hearing center at Tulane employs a preschool teacher, but I understand that preschool teacher is not a trained teacher of the deaf. I do not know what he can do with deaf children.

Mr. Quie. When you submit the salary schedule, could you give us also the salary of those in public schools? That is, if you have access

to that.

Mrs. Jones. We can do that. Ours is the minimum public school

salary

Do you wish also the added amounts that are paid to the teachers of the deaf in the Shreyeport schools and in the New Orleans schools?

Mr. Quie. Yes. I think this is happening in many States, where the teachers in the State residential schools are paid considerably less than those in public schools.

Mrs. Jones. We are on the minimum State salary schedule.

Mrs. Green. Can you estimate what that is?

Mrs. Jones. I can give you the maximum, because I can subtract and get my own salary. The maximum, the greatest amount that a teacher can get after many years of service and a master's degree would be around \$6,200 or \$6,400. They are implementing that within a year or two. There are schools who pay less.

Mrs. Green. We have a shortage in our State. We will have some

of them come down here and recruit.

Mr. Elliott. Thank you very much, Mrs. Jones.

Now I will call Mrs. Marian M. Lee, National Society for the Prevention of Blindness, Asheville, N.C.

Is Mrs. Lee present?

If not, I will call Mr. William P. Turner, director, the Workshop for the Blind and Disabled, Inc., Birmingham, Ala.

STATEMENT OF WILLIAM P. TURNER, DIRECTOR, THE WORKSHOP FOR THE BLIND AND DISABLED, INC., BIRMINGHAM, ALA.

Mr. Turner. Thank you, Mr. Chairman.

The Chairman. Mr. Turner, you may proceed, subject to our 10-

minute limitation which I must start enforcing.

Mr. Turner. Mr. Chairman and members of the committee, I have read the Rehabilitation Act of 1959 proposed by Congressman Elliott, and I certainly would like to support this program as a whole. One part I would like particularly to comment on is the part deal-

ing with workshops and rehabilitation facilities.

It is my belief that a community should be allowed to raise money which would be matched by the Federal Government, provided this was approved through the State vocational rehabilitation service and had the approval of the State agency, not only for the expansion and improvement of existing facilities, but for the construction and equipping of new buildings.

I would like for the law to provide for not only an initial staffing of facilities, but for the staffing on a continuing basis, to be matched

by local facility funds.

I would like to see surplus property made available to workshops

or approved facilities where Federal money is being used.

As director of the workshop for handicapped people, I consider one of our greatest needs to be for adequate equipment, to carry on the operation and evaluation program. Many of our people in workshops probably will never go back into employment in competitive industry, due to the nature and severity of their handicaps.

However, with a small amount of help, these people are able to live their lives as useful citizens in their respective communities, to own their homes, educate their children, pay their taxes, and live a near normal life, despite their handicap. However, some form of subsidization is necessary, because very few of these people reach what

you would call top or normal efficiency in any job.

Jobs for these people must be carefully selected and people thoroughly trained. Many times, with adequate training, adjustment and orientation, these people are able to go into competitive industry without asking aid from anyone. Both in our training and terminal employment there is a need for additional equipment, maintenance of present facilities and expanding job opportunities; namely, the manufacturing of switchboxes. We are engaged in the manufacturing of switchboxes as one of our projects now. Those are the boxes you have on the wall for switches. We need drill presses, lathes, milling machines, shapers, welding machines, and other equipment, much too expensive for us to dream of buying, especially when the cost of such equipment would be paid for out of earnings produced or created by severely handicapped people.

Vocational schools, one of which I was associated with for the past 10 years, are doing an excellent job training our young people and adults for the various highly skilled trades, also under the fine education bill sponsored jointly by yourself, Congressman Elliott, and the Honorable Senator Lister Hill. However, these courses consist of complete trade training, requiring from 2 to 6 years to complete

Their goal is to graduate a journeyman technician or specialist in a particular field and trade chosen by the student. There are certain physical and educational requirements these people must meet as a prerequisite to enrollment in these courses. The people in our workshop couldn't meet these combined requirements, in many cases neither requirement, but there is an area in which these people can be trained and employed: that is, a semiskilled job, where they learn to do one or a few simple operations on one machine. Some of these jobs would be classified as drill-press operators, turret-lathe operators, grinders, shapers, or milling machine operators, punch-press operators, and

many such jobs, where no close tolerances are necessary. Much less

training is required for these jobs.

I feel the workshops for handicapped are in an excellent position to develop these fields of training. Most of the equipment needed in the workshops could be secured through the Health, Education, and Welfare agency of our Federal Government if we were made eligible to participate in securing surplus property.

Many of our handicapped people are young enough today to probably see the anticipated tremendous shortage of workers in the not too distant future and have a part in lessening this shortage through

training they receive in workshops.

Another great need in workshops is some source for a steady flow of work. One way of meeting some of these needs is the opportunity to bid competitively on small Government contracts handled through the Small Business Administration, ordnance procurement offices, military installations. Many of these jobs consist of sewing, packaging, labeling, sorting, collating, light manufacturing and fabrication.

In many instances, the workships already have the know-how and

the facilities to do these jobs.

I believe that is all I have to say.

Mr. Elliott. Thank you very much, Mr. Turner.

Are there any questions of Mr. Turner?

Mrs. Green. Is this a private agency that you represent?

Mr. Turner. It is sponsored jointly through the community chest and under the supervision of the rehabilitation association. It is a nonprofit organization. The small subsidy we get is from the community chest.

Mr. Giaimo. Do you get any funds from the State?

Mr. Turner. The only funds we get from the rehabilitation agencies are for training, training or some evaluative work that we do. They put them in as students and they pay us a tuition for that. That is the only thing we receive.

Mr. Giaimo. Other than that, is the income on your own products? Mr. Turner. We get it from the work we do in the shop; yes, sir. Mr. Elliott. Thank you very much, Mr. Turner. Your testimony has been very helpful. We appreciate it.

Our next witness is Mrs. Bess Bains, attendance supervisor, Blount

County public schools, Oneonta, Ala. Is Mrs. Bains here?

If not, our next witness is T. Euclid Rains, trustee, Alabama Institutions for the Deaf and Blind, Albertville, Ala.

STATEMENT OF T. EUCLID RAINS, TRUSTEE, ALABAMA INSTITU-TIONS FOR THE DEAF AND BLIND, ALBERTVILLE, ALA.

Mr. Rains. Hon. Carl Elliott.

Mr. Elliott. Are you related to Congressman Albert Rains? Mr. Rains. No, I am sorry to say I am not. He is a good friend,

though. Mr. Elliott. You come from his area, I notice.

Mr. Rains. Yes, sir; we are both from Bucks Pocket.

Mr. Elliott. When did you move to Rainsville?

Mr. RAINS. Some time ago.

I have been here since early this morning and very much of what I would say to your committee has already been said. I think that it is self-evident that a need for help for the handicapped of the South is urgent.

I would like for you to remember this one thing: Jesus Christ once said, "For you have the poor always with you," and in your work back in Washington I would like for you to remember that "Ye have

the handicapped always with you."

When I was in college, I had a psychology professor who told us a little anecdote which I think pretty well sizes up the needs of the handicapped here. He said if you have to take a piece of wood and borrow a knife, you could whittle as good as anyone could. What he meant was, if you had tools and material to work with.

As you know, we have the material, and what we really need here

are specialized tools to shape this material into useful citizenry.

I am primarily interested in the education of the blind and deaf, and also I am interested in vocational rehabilitation with respect to the agricultural angle. In a psychology class once I remember it was said that a blind person is \$5 percent handicapped. That is saying that \$5 percent of what a person learns comes through his eyes. Therefore, blind people are, you might say, 15 percent efficient.

With this great deficiency of something to offer or something to

learn a trade, job opportunity is lessened a great deal.

When I finished college—I made pretty good grades—I couldn't find any work. I had looked around my part of the State and I believe that job opportunities for a totally blind person are about 1 percent of those of the average high school graduate, notwithstanding my college education. That was how I felt.

Today the vocational rehabilitation program in our State has hired, trained, sent to college and then turned around and hired these people, for the reason that we don't have enough funds or enough liberalized legislation to train people in fields that will enable them to go into

competitive areas or to enter themselves into the market of labor, along with the society work.

Back several years ago, and some of this is still with us today, when you left an institution for the blind in the South, they said, "Young man, go make a broom." But no longer do we have the kerosene lamp economic complex. Today we are in a modern age, with high expenses, and the demands for everyday living are so high and so expensive that education has become very important in even a blind person's life.

Blind people can be really useful. You will remember that "Paradise Lost" was written by a blind man, and a blind man discovered the mating cry of the queen bee. Blind people, some of them, are filling very high places. Some of them have walked on Pennsylvania Avenue. But the average blind man might not have sufficient ambition to reach these high goals, and he is the man that we want to

reach.

The School for the Deaf in Alabama has five teachers retired. Some of these teachers have been with us for as much as 30 years. They are almost indispensable. It is very difficult, in spite of the favorable salary scale, to get someone to come in to teach, who can teach, who is qualified to teach deaf people.

The president of the institution is constantly reminding us, the board, of the great need for specialized teachers. Also, as I am associated with the rehabilitation officials of the State, they are also reminding us that, in telling us that, they need specialized people, specialized trained personnel, and special equipment, and that they need certain legislation modified or liberalized so that they can better and more effectively carry out their program to the best advantage of the handicapped of the State.

Mr. Elliott. Mr. Rains, I am going to have to interrupt you right there, as your time is up. But I will ask you if you will do this: Will you send us the remainder of your statement within 2 weeks

from today and let us include it in our record?

Everything that has been said today is being taken down. Statements that are not completed we put into the record and have all of the material for the use and benefit of the members of the subcommittee. If you would do that with the remainder of your statement I would appreciate it.

Mr. Rains. I will be happy to do that.

Mr. Elliott. Thank you, sir.

(Prepared statement of Mr. Rains follows:)

STATEMENT OF T. EUCLID RAINS, TRUSTEE, ALABAMA INSTITUTES FOR DEAF AND BLIND

In conclusion, I would like to urge the passage of H.R. 3465 and House Joint Resolution 494. I would like to restate here that in the institutions for the deaf and blind here in Alabama, especially the institution for the deaf, that there exists a great need for specialized instructors in many areas. For example, qualified personnel in the area of speech therapy are extremely difficult to obtain and physical education instructors for the blind are likewise scarce.

In my opinion, the deal is not yet dealt for the handicapped in this country but the work only has just begun and now awaits some stalwart who will help to bring down the ironic barrier of limitations that has heretofore crucified so much "handicapped" ambition and ability on a cross of charity. I believe that the passage of the aforementioned bills will help in no little way in achieving a higher standard of living for the handicapped here in Alabama. I think that this will open new doors of opportunity to numbers of our handicapped who were heretofore denied a fuller measure of independent living by the "padlocks" of poverty and lack of education. In short, it will help us who work with the handicapped toward the realization of an ancient dream—namely, farewell to welfare.

Mr. Elliott. Our next witness is Mr. Gentry.

Mr. Gentry, you are an Alabama man. Would you mind, since we have these people from Atlanta, possibly being with us tomorrow?

Mr. Gentry. Yes, sir; I am sure I could come back tomorrow. I am with Mr. McBride.

Mr. Elliott. Are you traveling together?

Mr. Gentry, Yes.

Mr. Elliott. Well, you are nearly to Atlanta yourself. Have a seat and proceed with your statement.

STATEMENT OF E. H. GENTRY, DIRECTOR, ADULT BLIND DEPART-MENT, ALABAMA INSTITUTE FOR DEAF AND BLIND, TALLADEGA, ALA.

Mr. Gentry. Mr. Chairman and members of the committee, I think I can get through with what I have to say in 5 minutes.

May I be permitted first of all to give the committee as background

information my area of interest?

I am the administrative assistant to the president of the Alabama Institute for the Deaf and Blind, with responsibility for the direction of the Department of Adult Blind, with all services to the blind which makes up that program; director of the Comprehensive Center for the Deaf, and director of Vocational Education.

The development of facilities which we have in our State institution represents the joint efforts with the State division of rehabilitation. Vocational education programs in the school provide training

for both inschool and out-of-school deaf and blind.

We are able to move out within the framework of the present Federal legislation with the following exceptions, which I wish to emphasize: No. 1—I will not take the time to emphasize this further, as all of us who have been here today have heard the excellent presentations on the need for more and better trained personnel.

The needs are so great there that we could keep on talking about that. But the staffing of rehabilitation centers for the deaf and blind is equally as important as development of staff or of teachers for the

classroom work in special fields of special education.

I would like, Mr. Chairman and members of the committee, to make

two or three suggestions, possible suggestions.

I would like to suggest that possibly the present Federal Rehabilitation Act be amended to legalize the expenditures for construction of some much needed facilities. As the law now stands you have to improve or add to an existing facility. It may be better to move the facility 20 feet away from the building, but you cannot do it. The limitations in the Federal act now certainly work a hardship in some cases.

I would like to see the Federal act liberalized for periods of evaluation and diagnosis, particularly in the field of the deaf and blind, to be more liberal than now. I would like to see it liberalized to allow payments while the person is out on job trial experiments in rehabili-

tation.

I am particularly concerned and interested after exactly 30 years this May 1 in the field of special education and rehabilitation, and with the State institute for the deaf and blind, about this one area of legislation known as the Independent Living Act.

I think we have gone far enough piecemeal, Congressmen, in this whole field of rehabilitation. I think we have been adding to, ever since, to my certain knowledge, 30 years, which has been fine, but we have to do the job right or quit doing a piecemeal job as we go along.

I think this independent living rehabilitation measure would permit many services, even through our home teaching program for the blind in Alabama. I will not take the time to read these, but I will provide those services that may be rendered, if that proposed legislation is made into law.

I would like to close by saying that I am in full accord with all the things that have been discussed by our groups interested in all of these areas of special education and rehabilitation that will be presented here, but there is one thing that may not be included in that, and that is the whole area of talking-book machines and reading materials as provided through the Library of Congress.

We have had in the last 5 years in the development of a comprehensive center for the blind in Alabama under the Adult Blind Department Act a good many difficulties in serving the blind in the State through the home teaching program and through the training pro-

Over 400 blind have come through that center for diagnosis, evaluation, vocational training, and followthrough back on the job. A little more than 300 of them are self-supporting today. But I am here to say to you that the services rendered have been meager. They haven't been anything like what they should have been, to really

establish them.

For example, as a result of a 3-year demonstration project in rural pursuits in the field of agriculture in Alabama, which has just been completed, in which six farmers were placed on farm production units, as a result of that there have been 18 additional farmers estab-

lished.

But did you know that even though we bring them to the institute, through a demonstration farm we are able to teach them how to operate a poultry house, and when they go back home rehabilitation funds cannot be used to provide that egg laying house? I say to you that we need rehabilitation liberalized in order to serve these people.

Thank you.

Mr. Elliott. Can blind people be rehabilitated to operate these cage-

laying operations efficiently?

Mr. Gentry. Yes, sir. We have 18 of them in Alabama today doing it.

Mr. Elliott. Thank you very much.

Our next witness is Miss Vera J. McClain, home teacher and counselor for the blind, Adult Blind Department, Alabama Institute for Deaf and Blind, Birmingham, Ala.

Miss McClain, you may proceed in any manner that you desire. I

regret that we must limit you to 10 minutes.

STATEMENT OF VERA J. McCLAIN, HOME TEACHER AND COUNSELOR FOR THE BLIND, ADULT BLIND DEPARTMENT, ALABAMA INSTI-TUTE FOR DEAF AND BLIND, BIRMINGHAM, ALA.

Miss McClain. Well, like most women, I can talk a lot longer than that.

Congressman and members of the committee, it is a real pleasure for me to meet with you here today in Cullman, mainly because this is my hometown. This is where I graduated from Cullman High School in 1946. Then I went blind the following year. I went to the school for the blind as a special student for a year to learn what blind people did in the way of work and how they lived and things of that nature.

Then it has been my good fortune to go to Alabama College and be a graduate from that fine school and earn my degree in social work. In addition to that, I have been to the University of Pennsylvania and had training in adult blind education, and to Boston University for training and work with the emotionally disturbed. Finally I got my master's degree from Hunter College, in rehabilitation counseling, where I had the good fortune of having Dr. Frampton as one of my instructors.

Today I would like to talk of my experiences, having 6 years in the field of work with the blind, and these are some of my observations which I have picked up. This experience was drawn in part, probably, from some of the insight I have had in my professional training.

Some of these points I did not hear mentioned in Atlanta, and there are things that I thought about during the night which I feel have to have some consideration. So I got up this morning and rewrote my whole speech. I haven't had time to correct it, but anyway, I will go through and try to bring out these points as best I can.

No. 1. I do not think we can stress too much the need for the enactment of H.R. 3465. Being interested in the field of work for the blind.

most of my remarks here today will pertain to the blind.

Whereas fully half of the Nation's blind population is estimated to be in the older age range; and whereas, a large proportion of the blind population between the ages of 16 and 65 are severely limited by other disabling conditions which render them unsusceptible or ineligible for rehabilitation services under current regulations, I hereby give my

full suport for the enactment of the aforementioned bill.

It is felt, for example, that the provision of competent instruction and practical skills in conjunction with other rehabilitation services, where no vocational objective in competitive, gainful employment is indicated, that these people may be unable to achieve a certain amount of independence in the performance of daily demands and in personal adjustments to render them independent enough that some other member of the family unit who may be necessarily encumbered at the present time as an attendant may be relieved for an opportunity for employment outside the home.

I think this point has been brought out before, but certainly it is

well worth mentioning again and again.

Point No. 2. This is a problem which we feel is a very urgent problem here in Alabama, and I am not sure how it has been felt over the Nation, but I want to bring it out. We need more liberalized legislation as it pertains to blind recipients of public assistance enrolled in rehabilitation training programs. It has been our experience here that in Alabama, for example, after a blind person has been enrolled in training at our adult blind department's training center in Talladega, which in most instances requires the blind person to leave his family at home in another county, that his public assistance in accord with current regulations is drastically reduced or in a lot of instances even cut off after 2 months, which obviously jeopardizes the welfare of his dependent family back home and seriously impairs the effectiveness and the acceptance of the comprehensive training made available through vocational rehabilitation sponsorship.

I feel that this is an urgent problem which certainly deserves con-

sideration by this committee.

No. 3. And this is the point which Mr. Turner brought out, but I have it in my notes and I am concerned also, the erection of new work-

shop buildings and other rehabilitation facilities.

As we who are familiar with Public Law 565 know, it does provide for extension and improvement of already existing facilities. But we feel this should be amended to the effect that new buildings could be crected, say, using money which would be raised in the community, matched by Federal funds, to erect a new building in cases where it was felt to be necessary, and it would be helpful toward rehabilitating

more people.

No. 4. We need the development and expansion of employment opportunities for the blind. In view of the fact that most of the professional rehabilitation personnel in this country are felt to be limited by the lack of engineering and other scientific and technical skills, confronted in competitive industrial placement and workshop subcontract procurement, to make the broader and ever-increasing need for blind people for really substantial employment, it is deemed important that the Federal Government give some consideration to the employment of industrial research firms, such as Southern Industrial Research of Atlanta, to come into cities like Birmingham, for instance, and help us in the development of work opportunities and subcontract procurement.

This relationship would be one which would be probably a lot more meaningful, since these people from the industrial research organizations could assess the abilities of the blind, and things like that, through studies which they might have to do to readily make their assessment, and also so that they could talk and learn a great deal

about work for the blind and what blind people's skills are.

Then they could go out to industry and really talk to industry about things that most people in rehabilitation just do not have the skill or

knowledge to talk about in some cases.

With the support of the Federal Government, we feel that such an organization as Southern Industrial Research might be meaningful in helping us to develop and expand opportunities. This is something that needs study and development in itself, but it is a good idea to consider.

Mr. Elliott. Thank you very much, Miss McClain. (The following statement was submitted by Miss McClain:)

STATEMENT BY VERA J. McClain, Home Teacher and Counselor for the Blind, Adult Blind Department, Alabama Institute for Deaf and Blind, Birmingham, Ala.

I am pleased to have the opportunity of participating in the activities of the congressional study of special education and rehabilitation and equally pleased to express my views with regard to unmet needs on this occasion here in my hometown. You will be interested to know that I have been blind since shortly after graduation from Cullman High School in 1946. After attending the school for the blind in Talladega, as a special student, I developed an interest in professional services for blind people and in preparation for this objective I earned an A.B. degree in social work from Alabama College, Montevallo. I had further professional training at the University of Pennsylvania and Boston University. I have an M.S. degree in education, specializing in rehabilitation counseling, from Hunter College where it was my pleasure to have Dr. Merle Frampton of this committee as an instructor. I have had 6 years of experience in services for the blind as an employee of the Adult Blind Department of the Alabama Institute for Deaf and Blind, Talladega, and most of my remarks today will be relative to services for this particular disability group.

1. Full support of H.R. 3465: Since fully half of this Nation's blind population is estimated to be in the older age range, and in view of the fact that a large proportion of the blind population between the ages of 16 and 65 are severely limited by other disabling conditions which render them unsusceptible or ineligible for rehabilitation services under current Government regulations, I hereby offer my full support for the enactment of the aforementioned legislation. It is felt, for example, that the provision of competent instruction in practical skills, in conjunction with other rehabilitation services, where a vocational objective in competitive gainful employment is indicated, may enable these people to acquire

a renewed sense of dignity and to achieve adequate personal adjustment and independence in the performance of daily demands so as to dispense with the attendant services of another member of the family unit, who may as a result,

be able to accept or return to employment outside the home.

2. More liberalized legislation as it pertains to blind recipients of public assistance engaged in a rehabilitation training program: It has been our experience here in Alabama, for example, that after a blind person has been enrolled in training at our adult blind department's training center in Talladega, which in most instances requires the blind person to leave his family at home in another county, that his public assistance in accord with current regulations is drastically reduced or terminated after 2 months, which jeopardizes the welfare of his family back home and seriously impairs the effectiveness and his acceptance of the comprehensive training program made available through vocational rehabilitation sponsorship. It is felt that this is an urgent problem which deserves careful study and prompt attention.

3. The erection of new rehabilitation facilities: Public Law 565 should be amended to the extent that local money can be matched with Federal funds for the erection of new rehabilitation facilities rather than being limited to cur-

rent extension and improvement provisions of the law.

4. Development and expansion of employment opportunities for the blind: Inasmuch as most of the professional rehabilitation personnel in this country are limited by lack of engineering and other technical and scientific skills confronted in competitive industrial placement and workshop subcontract procurement to meet the broader and ever-increasing need of blind people for substantial employment, it appears advisable that the Federal Government should consider the employment of an industrial research resource; i.e., Southern Industrial Research of Atlanta, to provide their assistance in making more effective meaningful surveys of untapped employment possibilities.

Mr. Elliott. Our next witness is Mr. William G. Wolfe, professor of educational psychology, University of Texas, Austin, Tex.

STATEMENT OF DR. WILLIAM G. WOLFE, PROFESSOR OF EDUCA-TIONAL PSYCHOLOGY, UNIVERSITY OF TEXAS, AUSTIN, TEX.

Dr. Wolfe. Mr. Chairman and members of the committee, may I take this opportunity, please, to thank you for your kind invitation of January 11 inviting me to testify at this hearing.

I am professor of educational psychology and director of the program of special education at the University of Texas, in Austin. I would like also for the record to state that I am State president of

the United Cerebral Palsy of Texas.

In the interest of the time, I would like to present my discussion in a very succinct manner, stating a problem as I see it. You asked for urgent needs. I, of course, could not list all of them. I would like to list those I consider to be most urgent. Then I would like to follow a statement of the problems with a suggestion for the committee's consideration.

Problem No. 1: The care of the severely disabled person who is not able to maintain himself, is not mentally retarded but has no one to care for him. This, members of the committee, is a severe problem.

I offer as a suggestion for your consideration the provisions through Federal legislation for facilities for long-term care, in which the individual may live, be happy, et cetera. May I point out that we are not recommending just a custodial care institution. I would hope, and therefore suggest, that this particular facility be empowered to receive moneys from endowments, from private sources, et cetera.

I say this in passing: There are many families, quite wealthy, as a matter of fact, who would be more than happy to make endowments

available to institutions of this kind if they could assure the care of their severely involved child. I am thinking mainly of the cerebral

palsied child in this instance.

Problem No. 2: The care of the very young severely mentally retarded or physically disabled child. As possibly you know, many States have no facilities for such children below the age of 6 years and parents can only provide for these children in private facilities.

But as you also know, most parents cannot afford this type of fa-

cility for their children.

Suggestion: States should be encouraged to lower minimum ages, and, when necessary, funds should be provided for the purposes of enlarging existing facilities to permit the lowering of this minimum age and, thereby, the taking of these children.

Problem No. 3: Many patients in custodial care facilities could be maintained in home environments if proper facilities were available

to them in activities for daily living.

Suggestion: Legislation authorizing the Office of Vocational Rehabilitation additional funds to include this type of client in the pro-

gram. I am thinking, sir, of your bill, H.R. 3465.

Problem No. 4: Because of lack of diagnostic facilities throughout the South available to schools and rehabilitation programs, many children are not properly classified and, as a result, many children are

not receiving a proper clinical and/or educational program.

Suggestion: Legislation providing funds for the training of and employment of diagnostic personnel, such personnel as psychologists, social workers, et cetera. I might add that these particular personnel should be especially trained to do jobs for these particular types of deviate individuals. These funds should be allocated to the vocational rehabilitation departments and special education departments.

Problem No. 5: Lack of availability of properly trained personnel in the areas of crippled children, the deaf and the hard of hearing, the blind and the partially seeing, the area of speech therapy, psy-

chology, social work, physical and occupational therapy.

Suggestion: Graduate fellowships from the Department of Health, Education, and Welfare similar to the present graduate fellowship program in the area of the mentally retarded. I am at a loss, if I may have the privilege of stating this, to understand why it would be deemed feasible to have graduate fellowships in just one area of exceptionality and not in the others. I, as a professor in a university with all areas, find it very difficult to comprehend this.

We have need for other areas, ladies and gentlemen. We appreciate very much the fellowships we have in the area of the mentally retarded, but we would like to have others in the other areas.

Problem No. 6: Lack of ability of many educational programs to properly enrich their curriculum in many of the areas of special education for the purpose of providing a program for the above-men-

tioned personnel.

Suggestion: Training grants from the Federal Government to those institutions wishing to go into this program. May I strongly add, only to those institutions who present evidence first of a desire to do this work; secondly, institutions which have necessary laboratory facilities in their community to provide practice teaching and clinical

practice opportunities as well as observational opportunities for their students.

Problem No. 7: Lack of proper liaison between special education, vocational rehabilitation, the Children's Bureau, child welfare, et

cetera

Suggestion: A joint committee be appointed at Federal, State, and local levels, with representatives from each service to function when programs, grants, policies, et cetera, are discussed affecting the exceptional children. At present I understand that there are 33 Federal departments contributing financially toward deviate children. I also understand that these agencies spend over a quarter of a billion dollars. I feel that a study should be made of this.

My last point is research. The problem: I personally feel that there is a lot of waste, many times in terms of money, time expended,

as well as good data, in our present setup.

Suggestion: No. 1, coordinate medical and paramedical research and cut down on duplication; No. 2, place specialists from the specific fields in which the research is being attempted on the review panels at the Federal level.

If I may say one thing about that, in the review panels I would hope that there would be a specialist on this review panel from the area in which the research is being contemplated, so that better understanding might be afforded to the planning for this research.

Item 3, create a research data pool. As chairman of the medical professional board of the United Cerebral Palsy of Texas, I have learned from many physicians, outstanding neurosurgeons, et cetera, that many physicians, centers, schools, et cetera, are doing research, have available data, but do not have the time and general resources to make these data available to the general field through publication.

It is their feeling and mine that a research pool might be considered into which data might be placed and then a team of research specialists would look at these data, coordinate these data, and much wealth would come not only in terms of service, but planning for many years

ahead.

In closing, I think there is a tremendous need to expand services. I also feel that there is a possibility for saving money in certain areas of this area of special education and rehabilitation by combining services.

If we can do this, this saving of money, we can take this saving and

place it into the area of expansion.

With your permission, I would like to, at the request of the medical professional board of the United Cerebral Palsy of Texas, place in your hands, if you will allow it, a survey that was made of cerebral palsy in the State of Texas. This is a very comprehensive thing. It tells the need in this particular field. I would like to submit this, if I may.

Mr. Elliott. Without objection, the material referred to by Dr.

Wolfe will be made a part of the committee files.

Dr. Wolfe. May I say, too, sir, that I appreciate this high privilege of appearing before you.

Mr. Elliott. We are honored to have you appear, Dr. Wolfe.

Thank you very much.

Our next witness is Dr. Mamie Jones, director of special education, State department of education, Atlanta, Ga.

Let me say that after Miss Jones is finished, we will recognize Dr. Frampton to introduce our witnesses who have come directly from the workshop in Atlanta. After Dr. Jones' testimony we will take a 5minute recess, and we will be ready to start with the workshop witnesses at 4 o'clock.

STATEMENT OF DR. MAMIE JONES, DIRECTOR OF SPECIAL EDUCA-TION, STATE DEPARTMENT OF EDUCATION, ATLANTA, GA.

Dr. Jones. Thank you.

Mr. Chairman and honorable members of the committee, I deeply appreciate being with you today. To begin with, I think it is wonderful what you have already done for children who are exceptional. You have brought two groups of people together, those in the services for exceptional children and those in vocational rehabilitation, to talk about problems.

We who work in the field of exceptional children, and I coordinate a program for all children and work for children who are exceptional. recognize that what we do for these children in the schools will be of little value unless they are rehabilitated and can find their equal place in society. So I think already you have contributed a great deal by

bringing us together.

I want to say that my discussion today may be a little different. I am not pleading for a specific type of exceptionality. I am putting in a plea for all children who differ. As we think about children who are exceptional, regardless of what their exceptionality is, whether they are blind, whether they are visually impaired, or deaf, hard of hearing, have speech problems, whether they have problems of giftedness that have not been recognized and they do not have a program to meet them, no matter what it is, our end goal for these children is the same.

Our end goal is to see them as self-respecting citizens who have had

an opportunity to develop to the maximum of their ability.

I feel that in your study, in the work that you are doing, we are making steps toward this. As we think about these children, we recognize that each type of exceptionality may attempt to reach that goal by a devious route, but it is our problem and our job to find out what that route is, to find out what blocks might be in their way, and to remove those blocks so that they might be able to eventually receive and be accepted as worthwhile and contributing citizens.

We think that through this study that you perhaps are doing the best thing that can be done, because you are working toward giving them these rights. You have heard statistics, I am sure, so today Iwant to talk a little bit about children. I want us to think about them

for a few minutes. Let's think about what their needs are.

First of all, if we are talking about these children, they have to be identified. We have to know who they are, what their problems are, and what blocks are in their way.

Second, we have to know what treatments are available and if they

can be treated in any way.

Third, we have to provide an educational program for them, so that they, too, can again receive their right education.

Fourth, we have to think about their needs for rehabilitation or habilitation, and finding a vocation, so that they can take their place.

I would like to first of all talk about these children in identification. We have heard today, you have heard, the need for qualified professional personnel. This is true if any of these needs are to be met and recognized. We have to have them in all fields, so I will not attempt to specify.

But I would like to talk to you about Mary, who was recommended for a class called mentally retarded, and whose teacher said that she was dumb and could not get anywhere. But upon adequate diagnosis,

Mary was found to be superior, a gifted child.

I would like to tell you about Johnny, who was having a great deal of difficulty in school. He began stealing, he began having problems of various types, and it was found out after adequate diagnosis of Johnny that he had severe visual problems, that he had a problem at home that was unsolvable, but with proper education, work and planning, Johnny was able to take his place.

Frequently teachers, parents and others give names to children, like mentally retarded, dumb and mean, and because of this, frequently these children then may respond to those names and may eventually develop a concept that they are either mentally retarded or dumb and

function that way.

So actually, we who work in the area of exceptional children feel that we must have adequate diagnosis to plan for these children. Only then, when they are available in public schools and in centers, can we adequately find them. Then, of course, after the child has been located and has been found, he needs medical care or clinical care of some type and treatment, and this needs to be provided.

An educational program to fit his needs must be provided, whether it is done in a residential school or in the public schools. But they need to have their needs and educational needs planned for and met.

If you have visited in some of the schools, you probably have seen 15-year-olds sitting in some first-grade classes or maybe some children who have not been allowed to go to school, as we have found in our State and in others. Perhaps because they are paralyzed from the waist down, or because they are too severely retarded, they think that they could not fit into a program.

We have calls for these all the time. Then as we are planning for these children, we need to recognize that the majority of our children's handicaps do not come singly, but they are multiple handicaps.

In a study that was done in Georgia on exceptional children, headed by Dr. Wishy, it was found that the total number of handicaps per child was approximately 2.7 per child. So as we plan for these children, then, we need to plan for children with multiple handicaps, because many of these children have varied means, because the child who is cerebral palsied may have a visual problem, a hearing problem, a speech problem; the child who is mentally retarded may have a speech problem.

If a child's needs are not being met, he may also develop another problem which becomes emotional, and that block will need to be

removed before his needs can be adequately met.

So it is the feeling of the speaker that as we are planning and working for these children, we hope that your legislation as you consider and work with this will consider all areas of exceptionality. As was stated earlier, we would like to see any bills providing for

trainees, grants, and fellowships to include professional workers in all of the areas.

Some of our States have seen the wisdom of a broad legislative viewpoint by our foundation programs and by attempting to meet these needs as they are presented in both the local and in the States. It is our hope that legislation that is thought of will continue to do this as you are working with it.

It is also hoped, as was stated earlier, that children will be identified earlier and that programs will be planned for them earlier, educational programs. Many children miss the best years of their lives because they are identified too late or because a program is not pro-

vided for them soon enough.

Lastly, I would like to say that as we continue working, we are glad that you are willing to accept testimony and discussion from people in the field, and we hope that they, too, will have an opportunity of working on legislative platforms.

Thank you again for this opportunity.

Mr. Elliott. Thank you, Dr. Jones, for your testimony. It was very fine.

We will now have a 5-minute recess and return at 4 o'clock.

(A short recess was taken.)

Mr. Elliott. The subcommittee will come to order.

I want to thank Judge Graf Hart, the probate judge of this county, for furnishing us with coffee and refreshments. We appreciate that.

Also, I want to recognize Mayor C. R. Cain, of Oakman, Ala., and his friend and our friend, Joe M. Corry, from Oakman, Ala. We appreciate their presence.

Now I will recognize Dr. Merle E. Frampton, who has served and who is now serving as director of our workshop studies, which he has

carried on in New York, New Haven, and Atlanta.

Dr. Frampton has brought from his workshop studies in Atlanta certain witnesses that he will tell us about. We will begin with them at this time.

STATEMENT OF DR. MERLE E. FRAMPTON, DIRECTOR, WORKSHOP STUDIES. SUBCOMMITTEE ON SPECIAL EDUCATION

Dr. Frampton. Mr. Chairman and members of the subcommittee, this is the third of the regional workshops which the committee authorized your study staff to produce. This is the largest of all of the national workshops, encompassing 14 States and with something over 275 people in active participation yesterday.

I only want to say to you before introducing the consultant, the regional consultant, that the vast majority, about 99 percent of these people, came long distances at their own expense to give you the benefit of their thinking. They are all high-quality professional

people in service, and some lay people.

At this time I am going to call upon Mr. William Geer, who is the associate director of the Southern Regional Educational Board, who has acted as the staff's regional consultant for the organization of this meeting. I am going to ask him to briefly explain the workshop to you and introduce the chairmen.

STATEMENT OF WILLIAM GEER, REGIONAL PROGRAMS ASSOCIATE, SOUTHERN EDUCATION BOARD

Mr. Geer. Mr. Chairman and members of the committee, first of all I would like to correct the title that Dr. Frampton has promoted me to. I am regional programs associate for the Southern Education

Board

Secondly, I would like to say that today has been a somewhat nostalgic day for me. Not many people know, but I grew up in Alabama until the age of 23, somewhat north of here. I am an Alabama Yankee, from Bridgeport. I am very pleased to be here under more favorable conditions than formerly when the football team I used to support would come to Cullman and get the pants beat off of them.

We have had a very stimulating workshop in Atlanta for the last 2 days, and I think I bring from almost 90 percent, at least, of the people who are there, their thanks to this committee for calling such

a meeting that they might come.

Dr. Frampton, they were pleased to pay their expenses. They had

a very stimulating experience.

We hope that from this deliberation of 2 days ideas were recorded that will be presented to you that will help you to know what people of this region think is needed for the exceptional children and the

handicapped and disabled adults of our region.

I realize that we cannot speak fully for the entire region, but may I say that the group of over 200 people is, I believe, representative of the various areas of handicapped. It is also a group of people dedicated to laying aside, at least as much as they could, their personal prejudices and ideas in attempting to join hands in a constructive discussion.

They were divided into seven groups and discussed visual disabilities, mentally retarded, speech and hearing problems, chronic disabilities, mentally and emotionally disturbed, neuromuscular and ortho-

pedic disabilities, and the gifted.

Today we have seven spokesmen for those groups. You will understand that just about 4:30 yesterday they completed their deliberations. They have not yet had time to write up complete reports of their meetings. So at this time we would like to ask your permission to file complete reports from these seven committees later.

Mr. Elliott. Without objection, the reports of the seven committees will be received within the next 15 days to 3 weeks and be incorporated into the record. Two or three weeks will give you time, will

it not?

Mr. Geer. Yes. We are expecting them in 10 days.

Mr. Elliott. You may proceed.

Mr. Geer. If it pleases the committee, then, I would like to present first to you as one of the cochairmen of the section on visual disabilities—the other chairman was Mr. Harry Simmons, executive director of the Florida Council for the Blind at Tampa—the cochairman representing education, Mr. J. M. Woolly, superintendent of the Arkansas School for the Blind at Little Rock. Mr. Woolly will present the report of that section.

STATEMENT OF J. M. WOOLLY, SUPERINTENDENT, ARKANSAS SCHOOL FOR THE BLIND, LITTLE ROCK, ARK,

Mr. Woolly. Mr. Chairman, Mrs. Green, gentlemen of the committee, I represent, as Mr. Geer told you, Mr. Harry E. Simmons, the other cochairman, and some 50 people from across the 14-State region who are interested in people with visual disabilities. Obviously my time limit will keep me from giving you the total picture as we discussed it yesterday and the day before.

Some 35 areas of need were proposed and discussed. Of those 35, the group felt that 25, a full 25, needed action of some sort. So within our report we will have recommendations on these 25 areas. I want, however, to select those which seem to be of the most importance at this moment and call them to your attention now.

The first is within the area of special education. Under Public Law 531, 83d Congress, it is impossible for much needed research to be undertaken, since the law limits eligibility to colleges, universities, and State educational agencies. It is felt that there is an immediate need for much educational research, such as (a) types of psychological tests appropriate for blind and partially seeing children; (b) better methods of vision screening of children for admission to various educational programs; (c) the kind and size of large print most suitable for partially seeing children; (d) the efficient use of low vision aids for these children; (e) the development of orientation and travel techniques for blind children, particularly the very young.

The solution to this total problem, as recommended by the workshop, to provide for research in such areas, it is proposed that Public Law 531, 83d Congress, be expanded to include other appropriate agencies interested in and able to perform such educational research, if the research projects proposed meet the criteria for acceptability.

Secondly, a problem which took a great deal of time and discussion: The act to promote the education of the blind under present law has proven inadequate to meet the expanding needs for educational materials for blind children. The American Printing House for the Blind, which administers the act, has drawn up for presentation to the Congress certain proposals for amending the basic act with a view to alleviating the above situation.

The workshop heartily approves the following proposals for amending the act as proposed by the American Printing House for the Blind:

(a) The present ex officio trusteeship of the Printing House should be increased to include not only the administrative heads of public educational institutions for the blind, or their designees, but also the chief State school officers or their designees, representing the blind children attending public schools for the seeing, for purposes of the administration of the act only.

This would give equal representation on the Printing House Board of Trustees for public schools and State schools for the blind and would serve to bring to the Printing House the advice, counsel, and expression of need of all those responsible for the education of blind

children insofar as the Federal act is concerned.

(b) There should be included in the language of the authorizing Federal act a provision for the establishment of advisory committees on publications, tangible apparatus, research and for such other purposes as may be deemed to be of help in administering the act, with proportionate representation between the residential schools for the blind and the children being educated in public schools. The provisions for such committees is now included in the bylaws only.

(c) There should be included in the authorizing legislation a definite statement to include ownership of materials now supplied under the act. At the present time, no such statement is included, nor has the Department of Health, Education, and Welfare been

able to make a decision.

(d) A part of the annual appropriations not to exceed 10 percent should be set aside, apart from the provision of credit, for the purpose of paying salaries and other expenses of specialists and staffs to assist the publications and other such advisory committees in performance of their functions and for the expense of members of such committees, but not for the purpose of salaries of committee members.

These funds are noted so that the committee staff may have the help of experts throughout the country in determining materials to be provided and the manner in which they are to be provided. The Printing House, as a private agency, should not be expected to provide such counsel out of funds which it must obtain through charging other agencies a higher price for the materials they purchase through the facilities of the Printing House or through contributions from the general public.

(e) A sum of \$200,000 to \$300,000 should be appropriated outright to the Printing House in 1 year which it could use and then as a sort of revolving fund for capital outlay in the production of finished stock, so that it might be available for immediate delivery as needed

on order from the educational institutions.

(f) The ceiling of limitations of the annual appropriation now set at \$400,000 should be eliminated entirely and such an appropriation should be requested and justified annually by the Printing House on the basis of the number of children to be served and costs of providing the materials needed.

Another problem that I would like to mention in the area of special education is that there are a growing number of visually handicapped children with other disabilities who can not be provided for in existing

programs.

It is strongly recommended that the Congress take action to establish regional diagnostic treatment and training centers in order to meet the needs of these children. It is also recommended that provisions be made for the training of special personnel to staff these centers.

Now, within the area of rehabilitation, there are some special problems to which I would like to call your attention, the first one being that of the need to evaluate the services now being provided. Rather than read a rather lengthy statement, I want to read a portion of it, and then simply discuss it shortly.

It has been a matter of common knowledge that there is an astounding variance from State to State in the quality, quantity and extent of services made available to blind individuals. Some of the States offer a comprehensive program of services ranging from a residential

adjustment and rehabilitation center for the blind to postplacement

counseling.

Other States offer only the most meager range of vocational services. This research is based on per capita expenditures in States, included in this study, and ranges from 2.4 cents per capita to 16 cents per capita. A list of State expenditures studied for this group of participating States and their per capita expenditures follow.

For obvious reasons, States are not identified except by code letters. As I said, in the statement itself the expenditures range from 2.4 cents per capita to 16 cents per capita, within the 16 Southern States which were included within this study, a wide divergence of service,

indeed.

It is very significant to note that the national average per capita

expenditure for public assistance is 49 cents.

A study should be conducted to establish a parity figure which would be the average of the higher half of all the States offering services to blind persons and (b) preparation of legislation and/or amendments to the provisions of Public Law 565 to make available for a specified number of years Federal funds permitting the low States to reach a parity per capita expenditure with the understanding that the States would make available at the conclusion of the period sufficient funds to meet matching requirements of funds in Public Law 565.

The need for Federal participation in research and in causes and prevention of eye diseases: Statistics indicate an increase. Obviously, with the increase in overall population, the incidence of blindness is increasing. Suggestions of solution would be considering the bulk of Federal-State funds absorbed in (a) underwriting financial assistance to persons unable of self-support; (b) education of the blind; (c) medical eye care; and (d) vocational rehabilitation.

It is strongly urged that support be given to legislation providing additional funds and more dynamic implentation of existing private and Federal and medical-socio programs devoted to the prevention

of related eye disease.

One other problem: The need for clear-cut definition of various levels of visual impairment which constitutes avocational and/or vocational handicap. The present accepted definition of blindness creates confusion in the public mind. However, until such time as a thoroughgoing study can be undertaken, it is necessary that all Federal legislation pertaining to the blind conform to the commonly accepted definition of 20/200 or less in the better eye, and so on.

Suggested solution: A study to develop and to standardize definitions on a national level of visual impairments which constitute avocational and/or vocational handicapped, including persons with vision

greater than 20/200.

I am sorry I have consumed slightly more than my time.

WORKSHOP REPORT ON THE VISUALLY IMPAIRED

It is with a great deal of satisfaction that the cochairman makes a report of the Workshop on the Rehabilitation of the Visually Handicapped to the Subcommittee on Special Education of the Committee on Education and Labor of the U.S. House of Representatives.

The workshop was fortunate in attracting a large representative group of 43 experienced and interested people in the field of services for the blind from the

large number of States included in this study. Prior to the workshop meeting, the cochairman for the group received from many of the participants notations regarding clearly identified troublesome areas and proposed solutions to some of

the problems posed.

During the progress of the workshop, realistic and objective consideration was given to each area of service inadequacy and there was a free interchange of ideas. Minority opinions were given careful and courteous consideration in all of the discussions. It was recognized that the blind individual traditionally has been at a serious disadvantage in functioning to the levels of his abilities within the framework of the socioeconomic institutions of a sighted society. Much progress has been made in expanding the possibilities for a more normal life for those who are blind, but much more needs to be done. However, it was evident that there was lack of sufficient time to consider the breadth of the subject matter assigned to this workshop; and it was unanimously recommended that a vehicle for additional workshop meetings should be provided for in the future.

The following is a list of most pressing inadequate service areas for the visually handicapped with proposed solutions representing the majority opinion of the group. Attached is a list of the workshop group who participated in the

study of the rehabilitation of the visually impaired.

Inadequate service area No. 1.—Needs of multiple unemployable handicapped

blind persons.

Blindness as an employment handicap is often aggravated by one or more coexisting disabilities which renders effective or full-time employment impossible. The group thus affected certainly constitute a significant number of blind persons. This group then is wholly confined to existence by public assistance, and such subsistence is certainly not conducive to high morale, satisfaction, and happiness. Many of this group could improve their condition by part-time non-competitive or homebound employment which would have important psychosocial as well as economic benefits.

Suggested solution: Title X of the Social Security Act should be amended to provide the exclusion of a total of \$1,200 net income per annum regardless of source in computing the financial resources of blind recipients of public assist-

ance moneys or grants.

Inadequate service area No. 2.—Needs of blind persons able to pursue limited

or full employment.

Certain legal restrictions exist that act as a deterrent to the seeking of partial or full employment of blind persons. These restrictions relate to the very limited amount of earned income that can be excluded in the determination of economic need for public assistance and the restrictive limits in savings or equity which may be accrued in a newly established business venture.

Suggested solution: It is therefor recommended that the above restrictions be modified so that an employable blind person can rise above bare subsistence level of living by amending title X of the Social Security Act to permit—

(a) That one-half of the earned income of blind recipients of public assistance be excluded in arriving at their total financial resources, up to a maximum of \$2,400.

(b) That the value of their permanent home be disregarded as a resource. (c) That the face value of life insurance policies, up to a total of \$5,000, be

waived in the computation of financial resources.

(d) Additional resources of blind recipients in the form of real or personal property, or income, which are deemed necessary and intended to activate voca-

tional plans for achieving self-support be retained by recipients.

(e) For the purpose of encouraging and enabling a greater number of recipients of aid to the blind to become self-supporting, all expenditures incurred by a recipient in effecting his plan to become self-supporting, including payments made for the purchase of fixtures and material needed by him in effecting such plan, shall be deducted from gross income in computing net income, provided that such payments shall not be more than \$100 per month.

Inadequate service area No. 3.—Need to evaluate the services provided.

It has long been a matter of common knowledge that there is an astounding variance from State to State in the quality, quantity and extent of services made available to blind individuals. Some of the States offer a comprehensive program of services ranging from a residential adjustment and rebabilitation center for the blind to post placement counseling. Other States offer only the most measure range of vocational services. The research is based on per capita expenditures in States included in this study and range from 0.024 to 0.160 per

capita. A list of State expenditures studied for this group of participating States and their per capita expenditures are as follows (for obvious reasons, States are not identified except by code letter):

State	Expenditures, fiscal 1959	Per capita
3	\$75, 058. 00	0, 02
b	67, 174, 00	. 02
)	108, 044, 00	. 03
1		. 03
D	149, 000, 00	. 04
	426, 473, 00	. 04
	180, 500, 00	. 04
1	182, 634, 00	. 03
	63, 242.00	. ()
	164, 265, 68	. 09
	386, 795, 00	. 1
	600, 677, 00	. 13
<u> </u>	637, 368, 00	. 1
	363, 971, 00	.1

It is very significant to note that the national average per capita expenditure for public assistance is 0.49-AB.

Suggested solution: (a) Study should be conducted to establish a parity figure which should be the average of the higher half of all the States offering services

to blind persons.

(b) Preparation of legislation and/or amendments to the provisions of Public Law 565 to make available, for a specified number of years, Federal funds permitting the low States to reach a parity per capita expenditure with the understanding that the individual States would make available, on the conclusion of the period, sufficient funds to meet matching requirements of Public Law 565.

Inadequate service area No. 4.—Need for comprehensive insurance programs

for visually handicapped persons.

Certain inequities in insurance rates and coverage which appear to exist for individuals and groups of blind persons are such that a study of this area is indicated to encourage action to correct seemingly discriminatory rates.

Suggested solution: That a study be made to determine means of meeting

insurance needs of blind people adequately.

Inadequate service area No. 5.—Need for increase in Federal financial participation in public assistance programs for the blind in order to increase the dollar

amount received per month.

The basic needs of blind persons are the same as those of every other individual but in addition there are needs peculiar to the handicap of blindness principally because the blind individual is so often cut off from resources available to the sighted world. The current \$65 per month ceiling on Federal participation depresses the standard of living of blind recipients to bare existence. Such a condition can be corrected only by increasing the ceiling on Federal participation in the program.

It is apparent that the total increased costs that will be entailed in desired improvements in public assistance for the blind cannot, at least initially, be

completely borne by the States.

Suggested solution: Legislation should be prepared to amend title X of the Social Security Act to provide a change of formula from the present average of \$65 per month to an increased amount more realistically based on the cost of living.

There was considerable difference of opinion on this question; the final vote

was 11 for and 7 against approval.

Inadequate service area No. 6.—Need for better understanding of the needs of

blind recipients of public assistance and rehabilitation clients.

Administrators of public assistance and rehabilitation who are unable to devote an adequate portion of their time and energies to the analysis of the special needs of blind persons sometime fail to understand the difference in the unique conditions which affect blind recipients and those which prevail for recipients of other public assistance categories who are not blind, and which to a great extent form the basis upon which public assistance and rehabilitation programs are developed and administered. If this situation is to be corrected there must be a differentiation of public assistance for the blind from the other categories.

Suggested solution: (a) That each State agency administering or supervising the administration of aid to the blind and/or rehabilitation should create a bureau or devision for the blind devoted to carrying out the administration of aid to the blind and/or rehabilitation services. This is the only truly effective means of assuring a reasonably adequate solution to the problem as stated;

(b) That title X of the Social Security Act should be amended to provide at least one full-time consultant on services to the blind in the public assistance

office of the U.S. Department of Health, Education and Welfare;

(c) That the Bureau of Public Assistance should regularly collect and more

widely distribute statistics on recipients of aid to the blind.

Inadequate service area No. 7 .- Need for amendments to Public Law 565 affecting rehabilitation clients including small business enterprises. Present provisions of Public Law 565 have demonstrated certain weaknesses

with respect to the following:

The inability of State agencies to pay rent and utilities for more than a

period of 1 month. 2. The inability of State agencies to pay for the renting of operational equipment for more than a period of 4 months.

3. The inability to provide maintenance following the placement of the client

beyond his first pay check or 1 month.

These limitations in many instances jeopardize the vocational rehabilitation

of blind persons.

Suggested solution: Public Law 565 be amended to authorize an agency to pay operational expenses for blind rehabilitation clients when necessary including clients placed in small business enterprises program for a period not to exceed 1 year, and to provide for the payment of maintenance for a period not to exceed 1 year following the initiation of the business enterprise.

Inadequate service area No. 8.-Need for amendment of Public Law 565 con-

cerning the provision of reader service to blind persons in training.

The economic needs requirement for reader service imposed by Public Law 565 has worked a great hardship on blind persons attending schools and universities.

Suggested solution: Public Law 565 and its attendant regulations should be amended so that the provision of reader service to blind clients in training would not be subject to a determination of financial need.

Inadequate service area No. 9.—Vending stands and/or snack bars.

The passage of Public Law 732 (Randolph-Sheppard Act) as amended has provided many lucrative employment opportunities for blind persons. However, in recent years, there has been a steady increase in the installation of vending machines by groups other than blind persons in Federal buildings or properties where vending stands are or might feasibly be operated by blind individuals.

Suggested solution: (a) Public Law 732 should be amended to prevent the income from vending machines accruing to any groups other than blind stand operators in Federal buildings or on Federal property where vending stands and/or snack bars may be profitably and satisfactorily operated by blind persons, or where, at the discretion of the State designated licensing agency, vending stands have been or should be permitted.

(b) Likewise, in architectural plans for future Federal buildings, provisions should be made for a suitable location for a vending facility. This provision should apply to buildings being erected under the lease-purchase act and, as far

as feasible, in federally financed hospitals.

Inadequate service area No. 10 .- Need for increased Federal participation

in research in causes and prevention of eye diseases.

Statistics reveal a marked increase in blindness resulting from a variety of causes. Obviously with the increase in overall population the incidence of blindness is proportionately increasing. The great increase in the number of aged in the United States has materially affected this factor.

Suggested solution: Considering the bulk of Federal-State funds absorbed in (a) underwriting financial assistance of persons incapable of self-support because of disabilities related to blindness: (b) education of the blind; (c) medical eye care; and (d) vocational rehabilitation, it is strongly urged that support be given to legislation providing additional funds and more dynamic implementation of existing Federal and private medical and medical-social research programs devoted to prevention of related eye disease.

Inadequate service area No. 11.—Need for an independent living program.

Pressing and important unmet needs are further accentuating the lack of Federal-State responsibility (legislation) in providing services to blind persons incapable of productive and competitive employment and dependent upon daily home care needs and/or ultimate institutional care. Undoubtedly, a large proportion of this group are capable of training in self-care and increased daily activities, useful and independent living, and others are capable of absorbing training in home or restricted productive activity of a noncompetitive nature.

Suggested solution: Support of amendment to Public Law 565 in providing the necessary legislation, extending services to that group not now eligible for vocational rehabilitation but capable of benefiting from rehabilitation services assisting in greater independent usefulness, personal efficiency and possible limited employment. Also, provide for sufficient personnel, diagnostic facilities and rehabilitation centers needed in activating such a program. Federal funds will need to be provided for the training and employment of professional personnel to accomplish these aims.

Inadequate service area No. 12.—Need for additional Federal support to finance training of personnel as specialists in all areas of work for the blind.

There is an increasing need for training additional personnel in the special

procedures in all areas of resources for blind individuals.

Suggested solution: That an increase in funds through Public Law 565 should provide an increase in the amount of the financial assistance and in the number of scholarships and fellowships so that these professional and technical specialists may receive special training and orientation in serving blind persons. Also grants be provided to public and private agencies providing competent re-habilitation services so that they can employ qualified personnel to supervise internships of special graduate students in the field of services to the blind and visually handicapped.

Inadequate service area No. 13.—Visually handicapped not being served by any

group.

There are a large number of individuals whose vision is greater than 20/200 but who have an impairment which constitutes a severe vocational handicap who are in a twilight zone as far as being eligible for service. Apparently they are

not receiving adequate services to meet their needs.

Suggested solution: It is therefore strongly urged that the subcommittee through appropriate amendments to existing legislation take cognizance of this need and make ample provision so that these visually impaired persons will receive those vocational rehabilitation services which will develop their maximum employment potential.

Inadequate service area No. 14.—Need for clear-cut definition of various levels of visual impairment which constitutes a vocational and/or educational handi-

The presently accepted definition of blindness creates confusion in the public mind. However, until such time as a thoroughgoing study can be undertaken, it is necessary that all Federal legislation concerning the blind conform to the

commonly accepted definition quoted below:

"Central visual acuity of 20/200 or less in the better eye, with corrective glasses, or central visual acuity or more than 20/200 if there is a field defect in which the peripheral field has contracted to such an extent that the widest diameter of visual field subtends an angular distance no greater than 20° in the better eve."

Suggested solution: Study to develop and to standardize definitions on a national level of visual impairment which constitute a vocational and/or educational handicap, including persons with vision greater than 20/200.

Inadequate service area No. 15.—Diffused approach to the many problems con-

cerning services for the visually handicapped.

The group was greatly concerned that the workshop seemed to be following the traditional pattern for developing legislation. Heretofore, there has been a great preponderance of proposed legislation with little regard for long-term planning. It was obvious that time limitations were militating against the group in the development of a thorough coordinated legislative program incorporating the philisophy, principles, and standards which should be inherent in any major changes suggested by the workshop participants to the subcommittee.

Suggested solution: Additional workshops where further exploration of basic philosophies in relation to long-term planning should be considered. Workshops of this nature should provide for sufficient time to discuss standards, philoso-

phies and principles for guidance in future legislation.

The workshop group throught it would be of interest to list those inadequate service areas which time did not permit discussing but which had been listed for the agenda:

 Need for a department or division of services for the blind in each regional OVR office to provide qualified experienced persons whose primary responsibility

should be consultation on providing constructive services to the blind.

2. Need for revision of U.S. civil service laws to prevent discrimination against blind persons, coupled with specialists for the blind to acquaint appointing officers with the capabilities of blind applicants.

3. Need for establishing comprehensive diagnostic and evaluation centers for

the blind, including those with multiple disabilities.

4. Need for research on how blind persons function on the job.

Need for standards for training programs for mobility orientors.

6. Need for the proposed disability freeze.

ADDITIONAL REPORT ON THE VISUALLY IMPAIRED

Problem 1.—There is a critical need throughout the Nation, particularly in the southern region, for trained qualified teachers of visually disabled children, as well as ancillary personnel, such as counselors and therapists. Some of the major reasons for this situation are—

(a) Attraction of better teaching salaries outside of the region.

(b) Attraction of better salaries and fringe benefits in industry.

(c) General shortage of qualified teaching personnel.

(d) Shortage of training centers within easy geographical reach of teachers and prospective teachers.

(e) Lack of funds for the financing of study leave.

Solution: The provision of Federal grants-in-aid, or the establishment of scholarship funds, through the appropriate Federal department, looking to the training of teaching and ancillary personnel for the education of the visually disabled. This should include teaching personnel at the college level, as well as below.

Problem 2.—Experience dictates that, when attempts are made to meet the problems of special education through omnibus legislation, the needs of the visually disabled as well as others, sometimes suffer. This is particularly true in the area of the severely disabled, since this group comprises less than 1 percent

of the total known group of exceptional children.

Solution: It is recommended that such Federal assistance as may be provided through the Congress shall at all times be made available on a categorical basis to children with visual disabilities, as well as visually handicapped children with additional disabilities (the multihandicapped).

Problem 3.—Aside from direct service needs of blind children, it was felt in some quarters that there is an added expense to parents of blind children for

educational activities.

Solution: It is proposed that the Internal Revenue Code be amended to provide an extra exemption of \$600 per blind child per year for parents of blind children

(Note.—This proposal was defeated 12 to 11, with a number abstaining.)

Problem 4.—Under Public Law 531, 83d Congress, it is impossible for much needed research to be undertaken, since the law limits eligibility to colleges, universities, and State educational research, such as—

(a) Types of psychological tests appropriate for blind and partially seeing

children.

- (b) Better methods of vision screening of children for admission to various educational programs.
- (e) The kind and size of large print most suitable for partially seeing children.

(d) Efficient use of low-vision aids.

(c) The development of orientation and travel techniques for blind children, particularly the very young.

Solution: To provide for research in such areas, it is proposed that Public Law 531, 83d Congress, be expanded to include other appropriate agencies interested in and able to perform such educational research, if the research projects proposed, meet the criteria for acceptability.

Problem 5.—There is a need to locate and identify visually disabled children at the earliest possible age, and to provide appropriate services to them and their parents.

Solution: A strong program of casefinding and parent counseling should be set up through—

(a) Federal Government assistance to the State and private facilities for setting up standards for casefinding and parent counseling.

(b) Grants-in-aid now being provided for training personnel being ex-

tended to include workers in this area.

Problem 6.—The act to promote the education of the blind under present law, has proved inadequate to meeting the expanding needs for educational materials for blind children. The American Printing House for the Blind (which administers the act) has drawn up for presentation to the Congress certain proposals for amending the basic act with a view to alleviating the above situation.

Solution: The workshop heartily approves the following proposals for amend-

ing the act as proposed by the American Printing House for the Blind:

(a) The present ex officio trusteeship of the Printing House should be increased to include, not only the administrative heads of public educational institutions for the blind (or their designees), but also the chief State school officers (or their designees), representing the blind children attending public schools for the seeing—for purposes of administration of the act, only. This would give equal representation on the Printing House board of trustees for both the public schools and the residential schools for the blind, and would serve to bring to the Printing House the advice, counsel and expression of need of all those responsible for the education of blind children, insofar as the Federal act is concerned.

(b) There should be included in the language of the authorizing Federal act a provision for the establishment of advisory committees on publications, tangible apparatus, research, and for such other purposes as may be deemed to be of help in administering the act, with proportionate representation between the residential schools for the blind and the representatives of children being educated in public schools. The provisions for such committees is now included

in the bylaws of the Printing House only.

(c) There should be included in the authorizing legislation a definite statement to indicate ownership of materials supplied under the act. At the present time, no such statement is included, nor has the Department of Health, Education.

tion, and Welfare been able to make a definite decision on this point.

(d) A part of the annual appropriation, not to exceed 10 percent, should be set aside, apart from the distribution of credit for the provision of books and apparatus to the schools and classes, for the purpose of paying salaries and other expenses of experts and staff to assist the publications and other such advisory committees in performance of their functions, and for expenses of members of such committees, but not for the purpose of salaries for committee members. These funds are needed, so that the Printing House staff may have the benefit of the help of experts and people responsible for the education of blind children throughout the country in determining materials to be provided and the manner in which they are to be provided. The Printing House, as a private agency, should not be expected to provide such counsel out of funds which it must obtain through charging other agencies a higher price for the materials they purchase through the facilities of the Printing House or through contributions from the general public.

(e) A sum of \$200,000 to \$300,000 should be appropriated outright to the Printing House in 1 year, which it could use from then on as a sort of revolving fund for capital outlay in the production of finished stock, so that it might be available for immediate delivery as needed on order from educational institutions. As it now stands, the Printing House is hard pressed for current cash, because of its attempts to keep known items of fairly constant demand in stock in anticipation of orders from schools and classes, and a very real hardship is being worked on the institution because of its desire to provide services out of its own funds, for which it has not only any assurance of repayment, but which is not its responsibility, based on the present Federal act.

(f) The ceiling of limitation of the annual appropriation, now set at \$400,000 should be eliminated entirely, and such appropriation should be requested and justified annually by the Printing House on the basis of the number of children

to be served, and costs of providing the materials needed.

Problem 7.—There is a lack of any legislation to provide educational materials and equipment for identifiable partially seeing children. The criticalness of this situation is emphasized by the existence of a large number of such children in need of these materials.

Solution: To meet the problems imposed on special education by the large-

numbers of partially seeing children, it is proposed-

(a) That The Department of Health, Education, and Welfare be authorized to institute a study and develop a long-range program covering this area.

(b) Because of the dire emergency now existing, due to the lack of materials for instructional purposes for partially seeing children, a crash-program be initiated consisting of immediately available funds for the preparation and purchase of such materials.

Problem 8.—Educationally related materials, as provided by the Division for the Blind of the Library of Congress through its talking book program, are

somewhat limited, both in scope and quantity.

Solution: The Library of Congress should be urged to request additional necessary funds with which to make available a wider variety and an increased number of educationally related materials of this kind.

Problem 9.—In most Southern States, it appears that many children are in need of and are eligible for remedial eye-medical services which cannot be pro-

vided due to present Children's Bureau regulations.

Solution: (a) It is urged that the Children's Bureau revise its regulations so that any State agency for the blind, or other State agencies which can provide such services, be made eligible to receive such funds.

(b) It is further recommended that Congress be requested to increase the appropriation to the Children's Bureau for crippled children's services to implement recommendation (a).

Problem 10.—There is a growing number of visually handicapped children with

other disabilities who cannot be provided for in existing programs.

Solution: (a) It is strongly recommended that Congress take action to establish regional diagnostic, treatment, and training centers, in order to meet the

needs of these children.

(b) It is also recommended that provisions be made for the training of special personnel to staff these centers, as well as itinerant consultants.

WORKSHOP PARTICIPANTS

Harry E. Simmons, cochairman, Florida J. M. Woolly, cochairman, Arkansas

Alabama

Miss Mary Ann Bostick, Birmingham, Ala., Woodlawn School.

Mrs. Burlie Dutton. Birmingham, Ala., concession operator.

Mr. O. F. Wise, Montgomery, Ala., director, State vocational rehabilitation, Alabama.

Mrs. Vera McClain, Talladega, Ala., Alabama Institute for Deaf and Blind.

Mr. E. H. Gentry, Talladega, Ala., director, adult blind department, Alabama Institute for Deaf and Blind.

Arkansas

Mr. J. M. Woolly, Little Rock, Ark., superintendent, Arkansas School for the Blind.

Mr. Roy Kumpe, Little Rock, Ark., managing director, Arkansas Enterprises for the Blind, Inc.

Florida

Mr. J. M. Wallace, St. Augustine, Fla., president, Florida School for Deaf and Blind.

Mr. Lee Iverson, St. Augustine, Fla., principal, Florida School for Deaf and Blind.

Mr. Robert L. Robinson, Orlando, Fla., field representative, Blinded Veterans Association.

Mr. Maurice I. Tynan, Tangerine, Fla., chairman, Blind Advisory Committee of Florida.

Mr. G. J. Emanuele, Tampa, Fla., director, medical and social service, Florida Council for Blind.

Mr. Harry Simmons, Tampa, Fla., director, Florida Council for the Blind.

Mr. L. P. Howser, Louisville, Ky., superintendent, Kentucky School for the Blind.

Mr. Carson Y. Nolan, Louisville, Ky., director of educational research, American Printing House for the Blind.

Louisiana

Mr. James Perry, Baton Rouge, La., Louisiana State Department of Education. Mr. W. C. Gill, Baton Rouge, La., superintendent, Louisiana State School for the Blind.

Mississippi

Mr. Raymond D. Williams, Jackson, Miss., director, Division for Blind.

Mr. John W. Eakes, Jackson, Miss., superintendent, Mississippi School for the Blind.

New York

Mrs. Doris Sausser, New York, N.Y., field representative, division of community services. American Foundation for the Blind.

North Carolina

Mr. H. A. Wood, Raleigh, N.C., executive director, North Carolina Commission for the Blind.

Oklahoma

South Carolina

Mr. John Zuidema, Columbia, S.C., South Carolina State Board of Education.

Mr. J. M. Cherry, Columbia, S.C., chief, division for blind.

Mr. Marshall Tucker, Columbia, S.C., South Carolina Aurora Club, Inc.

Tennessee

Mrs. Amie Denison, Nashville, Tenn., resource teacher, Howard School.

Mr. E. J. Wood, Nashville, Tenn., superintendent, Tennessee School for the Blind.

Mr. William Ferrell. Nashville, Tenn., supervisor, rehabilitation for blind, State department of public welfare.

Mr. Sam Ashcraft, Nashville, Tenn., professor, George Peabody College.

Texas

Mr. Lon Alsup, Austin, Tex., executive secretary-director, State commission for blind.

Mr. R. Doyle Best, Dallas, Tex., Office of Vocational Rehabilitation, regional representative, region VII.

Mrs. Irene Westmoreland, Houston, Tex., consultant, division of special

education, department of education. Mrs. G. Rougagnac, Houston, Tex., executive director, Houston-Harris City Lighthouse for the Blind.

Virginia

Mr. Robert W. McDonald, Alexandria, Va., president, Virginia Federation for Blind.

Mr. Joseph Shinpaugh, Staunton, Va., superintendent, Virginia School for Deaf and Blind.

Dr. D. C. MacFarland, Richmond, Va., executive secretary, Virginia Commission for the Blind.

West Virginia

Mr. Elliott. Thank you very much.

Before we go on with our next witness, let me acknowledge the presence of Mr. Raymond Faught, the county superintendent of education of Walker County, our adjoining county; Dr. Jesse Burbadge, of the city school system, and Mr. Buel Cobb, the chairman of the city board of education of this city; Sheriff Crant Waldrop, who has been very helpful to the members of the subcommittee in getting the arrangements made for the subcommittee.

To all of you we express our appreciation.

Mr. Geer?

Mr. Geer. The cochairman of the section on the mentally retarded were Miss Grace M. Smith, assistant supervisor of special education service, State department of education, Richmond, Va., and Mr. Louie O. Sluder, director of Career and Guidance, Inc., 1300 San Antonio Street, Austin, Tex.

I might say that Mr. Sluder's organization is devoted to the rehabilitation of mentally handicapped youth and is performing quite a good service. Mr. Sluder will be the spokesman for his section.

STATEMENT OF LOUIE O. SLUDER, DIRECTOR, CAREER AND GUIDANCE, INC., AUSTIN, TEX.

Mr. Sluder. Mr. Chairman and members of the committee, I am speaking to you in behalf of the workshop committee on mental retardation. The first thing I would like to say is that our entire group of professional people who came from all over this region were literally effervescing with enthusiasm and appreciation for this opportunity. We wanted to go on record that we feel you have already made a greater contribution than what you might know or realize in the future, just by bringing us together.

Our committee worked together compatibly, congenially, and provocatively. We think this was one of the most interesting quests as to what the urgent needs of the mentally retarded we have ever experienced. Here again we perhaps will hear a lot about Federal

duplication, but I will not seek to duplicate too much.

I would bring to you the high points and we will submit our full

report as you have requested.

The first urgent need we feel is a comprehensive, evaluative and diagnostic center. The stress here is for all handicapped, not simply the mentally retarded. But this diagnostic center would be adequately staffed to give certified or valid diagnosis of the child's med-

ical, psychological, and social-vocational assessments.

Such centers should be strategically located and available to children in need of such services. This type of facility should assist in the early identification of the mentally retarded child, the counseling of the parents of the retarded child, the promotion of preparation during the child's preschool years for meeting those critical influences which reflect the individual's total social, intellectual, and personality development; the periodic reevaluation and further followup of the

child. This facility would be administered as the States see the

needs.

Federal grants are needed in those geographical areas where no facilities are now in existence, and then further extensions for those areas where there are some facilities.

For example, in Alabama they made a request of some \$200,000 the first year, \$300,000 the second year, and \$400,000 the third year to set up these diagnostic centers. George Jarre requested two centers. Oklahoma wanted \$250,000 simply to start the program, and

Texas, 10 centers.

May I say here that we did not seek to put an orbit around the moon. We wanted simply to get started in this program. We do not have it all worked out in a very utopian manner. We just want

some assistance to get on the ground floor and get started.

The second urgent need is training for professional and nonprofessional personnel that present scholarships and grants-in-aid provisions now confined to graduate programs be expanded to provide scholarship aids to students in the undergraduate level in the junior and senior years and to colleges offering approved programs on the graduate degree level in special education. Adequate training programs should be established on a regional basis.

The third urgent need is for further coordination of services between special education and rehabilitation which could or should be effected at the Federal level; the removal of restrictions which presently prohibit special education, vocational education, and vocational rehabilitation from working together for the best education, training and work opportunity possible for all mentally retarded.

For example, the removal of barriers such as employable age, number of hours or formalized training necessary, et cetera. The stress here is for maintenance of supervision for the mentally retarded in

order to work with them as long as the need is indicated.

The fourth urgent need is research, joint research by vocational rehabilitation and special education on what the curriculum content should be for the mentally retarded child in order to prepare them for employment.

The fifth urgent need is for workshops. We are asking that there be extended threefold, at least, the moneys available for workshops. Such funds should be liberalized for those areas which are unable to

meet the cost of matching funds.

The last need that I bring to you is a residential care for mentally retarded during the period of training. Residential care should be provided for some mentally retarded persons during the period necessary for evaluation and training. This may take the form of the halfway house or other residential facilities, where children may live under a supervised environment during the process of training and employment.

I thank you, and I appreciate this opportunity to appear.

Workshop Report on Mentally Retarded

Cochairmen

Special education: Grace Maynard Smith special education service, State Department of Education, Richmond, Va. Rehabilitation: Louie O. Sluder, director, Career & Guidance, Inc., Austin, Tex.

Participants

Almand, W. Fortson, director, C-Barc Occupational Center, Shreveport, La. Armstrong, Floyd H., State supervisor, Vocational Rehabilitation Service, State Department of Education, Richmond, Va.

Beaber, James D., coordinator, special education, University of Virginia,

Charlottesville, Va.

Beasley, Nancy, executive secretary, Alabama Association for Aid for Retarded Children, Montgomery, Ala.

Doggett, William J., counselor, Texas Educational Agency, Vocational Rehabilitation Division, Austin, Tex.

Elser, Roger P., State director special education, State Capitol, Charleston, W. Va. Fitzhugh, A. S., southeastern director, National Association for Retarded

Children, Griffin, Ga. Ford, W. Harold, assistant superintendent for instruction, Fairfax County

Schools, Fairfax, Va.

Haycraft, Sarah L., supervisor special education, State Department of Education, Frankfort, Ky.

Hurt, George L., area supervisor, vocational rehabilitation, Birmingham. Ala. Johnson, Vernon L., director special education, State Department of Education, Nashville, Tenn.

Khoury, Marcia, teacher, Brent School, Brent, Ala.

Magnifico, Leonard X., head, Department of Special Education, University of Tennessee, Knoxville, Tenn.

Mase, Darrel J., dean, College of Health Related Services, University of

Florida, Gainesville, Fla.

McEver, Mary Lou, rehabilitation counselor, Jacksonville, Fla.

McMeen, J. C., southeastern director, National Association for Retarded Children, Columbia, S.C.

Olshin, George, consultant, services for exceptional children, State department of education, Atlanta, Ga.

Pearce Donald, supervisor, special education, State department of education, Columbia, S.C.

Perry, Harold W., special education division, Memphis, Tenn.

Perry, James H., State director of special education, Baton Rouge, La.

Pigman, Alice, director, Opportunity Center School, Birmingham, Ala.

Ray, David B., Jr., superintendent, Arkansas Children's Colony, Conway, Ark, Scott, Frances A., assistant professor, special education, University of Georgia, Athens, Ga.

Sheffield, Clay S., director of guidance, Birmingham Public Schools, Birming-

ham, Ala.

Smith, Marshall L., executive director, Oklahoma County Council for Mentally Retarded Children, Oklahoma City, Okla. Spicker, Harold H., candidate, Peabody College, Special Education Depart-

ment, Nashville, Tenn.

Stewart, George (Mrs.), executive secretary, Georgia Association for Retarded Children, Atlanta, Ga.

Tait, Elizabeth, principal, Russell School, Mobile, Ala.

I. A REVIEW OF EXISTING LEGISLATION AND SERVICES

Conclusions: Most of the various functional and operational services now offered in the area of mental retardation have value and have served to a limited degree the purpose for which they were originally organized and established. Population growth, increased understanding and public acceptance of mental retardation, along with increased operational costs, give rise to constant expanding needs in the field.

II. THE MOST URGENT UNMET NEEDS IN THE AREA OF MENTAL RETARDATION

1. Resources for the proper and complete identification of mentally retarded children.

2. Resources for training professional and nonprofessional personnel.

3. Further coordination of services between special education and rehabilitation for more effective training and personal rehabilitation.

Research, both basic and applied.

5. Facilities for training the mentally retarded in supervised environments.

III, RECOMMENDATIONS FOR LEGISLATION WHICH WILL AID IN THE SOLUTION OF EXISTING PROBLEMS AND UNMET NEEDS

A. Comprehensive evaluative and diagnostic clinics or centers for all handicapped, including the mentally retarded. These should be adequately staffed to give certified or valid diagnosis of the child's medical, psychological, and social-vocational assessments. These centers should be strategically located in various geographical areas and made available to all children in need of such services. This type of facility should assist in—

1. The early identification of mentally retarded children.

2. The counseling of parents of retarded children.

The promotion of preparations during the child's preschool years for meeting those critical influences which reflect in the individual's total social, educational, and personality development.

4. The periodic reevaluation and further followup of children when

needed.

This facility would not be needed by all handicapped children but rather by those who have no other resources for valid identification.

Federal grants are needed for those geographical areas where no facilities of this kind are now existent, and for extension of services now in existence for an estimated 700,000 youngsters in the United States—some preschool age, and others older—who need this service.

Evaluative and diagnostic services should be provided through mobile units

in certain of the more obscure areas.

The above facilities would be administered as the States see the need.

B. Training for professional and nonprofessional personnel

Present Federal scholarships and grants-in-aid provisions, now confined to graduate programs, be expanded in order to provide scholarships and grants-in-aid to students on the undergraduate level in the junior and senior college years. If not direct grants, then grants on a loan basis to undergraduate students would provide potentials for training more classroom teachers.

Present Federal scholarships and grants-in-aid be continued to those colleges and universities offering approved programs on the graduate degree level in

special education.

Training programs, for economy purposes, should be established on regional basis. That is, one college or university should be designated as the center for complete training for the blind, another should emphasize training for the emotionally disturbed, according to the existing facilities or potentials for a training center.

Adequate stipends for training should be made available to—

Teachers for the mentally retarded (those preparing to teach and those already teaching).

Persons serving in supervisory positions in the field of mental retardation.

Counselors for parents of mentally retarded children.

Psychologists (services needed for valid identification of the mentally retarded).

Administrative personnel (particularly those employed in institutions.

workshops, and centers for the retarded).

Persons in need of inservice training for nonprofessional positions in the field of retardation.

Federal grants for traineeships should be made on the bases of requirements for certification and training, with consideration as to the time and individual effort necessary to complete the required study. Some grants might be offered on an annual basis; others for a longer period. Some should be allocated for summer study, for personnel already in service who wish to prepare themselves for more effective leadership.

The sum of \$500 per quarter is considered a reasonable scholarship grant for those working at a graduate level leading to a doctorate degree. Special arrange-

ments should be made for dependents.

Adequate training should include certain prescribed courses along with professional proficiency in the respective fields, as well as the ability to work with others.

Federal funds should be made available for professional workshops where leaders may meet in regional groups to study needs and to provide suggested ways of meeting such needs in the field of mental retardation. Workshop participants should include psychologists, social workers, guidance directors, teachers, administrators, supervisors, parents, vocational rehabilitation workers, and others concerned with mental retardation.

C. Further coordination of services between special education and rehabilitation which could or should be effected at the Federal level

Legislation should be considered for the removal of restrictions which presently prohibit special education, vocational education, and vocational rehabilitation from working together for the best education, training, and work opportunities possible for all mentally retarded children. The removal of barriers such as employable age, the number of hours of formalized training required, and other similar limiting regulations, would make for better cooperative effort and more effective rehabilitation of mentally retarded youth for training and employability.

Legislation affecting the training and rehabilitation of mentally retarded youth should stress the "maintenance of supervision" for them as long as the need is

indicated.

D. Research

Efforts should be continued and extended to encourage research in the field of mental retardation. There is need for both basic and applied research, in order to add to our present knowledge and to assist in the evaluation of certain techniques and procedures now in use.

The gap between basic and applied research could be "filled in" considerably by setting up research centers with persons in leadership positions capable of

directing research and giving practical help to those in the field.

Joint research is needed by vocational rehabilitation and special education to determine the nature of the curriculum content for mentally retarded children, in order to prepare retardates for more satisfying living and employability. Such research should include findings concerning:

Social attributes.

Essential academic skills.

General understandings concerning the world about them.

Skills (manual and otherwise) that will transfer from school experiences

to employment situations.

Special education and vocational rehabilitation in each State could undertake to work on curriculum studies for mentally retarded, without additional expense to the Federal Government. The findings should be gathered, compiled, and distributed by the Federal Government.

E. Workshops

Sheltered workshops, particularly for the mentally retarded in the classification of the trainable, are needed in all geographical areas. There should be a threefold extension of funds now available for the development of sheltered workshops. These workshops should be set up with facilities for training and terminable placement of mentally retarded individuals.

Funds for workshops should be liberalized for those areas which are unable to

meet the cost of matching funds.

Moneys should be made available for homebound employment of the mentally retarded who cannot, for various reasons, attend the area workshops.

F. Residential care for the mentally retarded during period of training

There are certain individuals in the classification of the mentally retarded who cannot be successfully trained in their local environment. Residential care should be provided for those mentally retarded persons who must be removed from their homes for a period necessary for their evaluation and training. This facility may take the form of Half-Way Houses or other residential facilities where children may live under a supervised environment during the process of training and employment.

The number of such facilities would depend upon the unmet needs in the various geographical areas. These centers would be administered as the States see

the need.

Mr. Elliott. Thank you very, very much for a fine report. Mr. Geer, we will hear your next witness from the workshop.

Mr. Geer. The next section which will be represented will be that of speech and hearing disabilities. The chairmen for that section were Mrs. Margaret L. Washington, from Nashville, Tenn., a person

who has distinguished herself in vocational rehabilitation over a number of years, and Dr. Stanley Ainsworth, chairman of the program for exceptional children at the University of Georgia, and also president of the American Speech and Hearing Association.

Dr. Ainsworth will speak for the group on speech and hearing

disabilities.

STATEMENT OF DR. STANLEY AINSWORTH, CHAIRMAN, PROGRAM FOR EXCEPTIONAL CHILDREN, UNIVERSITY OF GEORGIA, ATHENS, GA.

Dr. Ainsworth. Mr. Chairman and committee members, this report represents 29 individuals representing 10 Southern States who met for the past 2 days in Atlanta. These individuals represented schools for the deaf, vocational rehabilitation, and the profession of speech and hearing with its representatives from training institutions.

clinical centers, and public schools.

We explored several categories of needs. I am aware that you know what many of these categories are, because you have been hearing so much testimony in the past about them. We discussed problems involving services, particularly the needs for personnel to provide the services; the problems involved in improving, expanding, and creating training programs; the facilities and services needed to implement help for the speech and hearing handicapped; problems involving dissemination of information about speech and hearing disorders to parents, teachers, medical personnel, social workers, and so forth; and we also discussed briefly some research that is needed to improve the quality and efficiency of these services.

This report, of course, will merely present some of the highlights which we felt were of particular interest to you people at the Federal level. You are, I know, aware of the extreme shortage of personnel in this area. This can be readily determined by a glance at national

statistics.

I thought, however, that we should provide you with some regional data which would supplement and bolster the evidence that you already have. For instance, in 9 of the States represented at this workshop, there were an estimated 350 vacancies in speech correction or speech therapy, whichever you wish to call it. These were actual jobs that are available immediately, either because people have left the job and it has not been filled, or because it has been budgeted and personnel could not be found.

In clinical audiology there are 78 vacancies estimated from the people present. You have already heard of the shortage of teachers for the deaf. I would like to present a little different slant on this.

From 20 to 50 percent of the present teachers in the schools represented have not completed certification in this field, so they are relatively untrained. From 10 to 12 percent will retire or reach retirement age within the next 5 years.

The hard of hearing present another area, and it is estimated that 1 percent of school age and possibly the same number of adults need this help. There are very, very few teachers or therapists of this

kind in the whole region.

In the area of training programs, it appears that the problems here are threefold. First, we have a problem of utilizing the present programs to full capacity. This involves the need for a great deal of recruitment.

A second problem is the broadening of the training and improving the remedial services in relation to the training programs. We need to include in the training both speech and hearing. Many of our training programs concentrate entirely in the field of speech.

We need to provide more comprehensive and complete diagnostic and therapeutic services by the faculty themselves in order to meet the needs of the severely handicapped and to demonstrate for training purposes. We need to train more personnel at the advanced levels in speech and hearing as well as at the basic levels.

We need to insure that all staff members in training institutions

have advance certification and/or doctoral training.

In the area of the deaf there is a need for more adequately staffed facilities which are situated better geographically. We feel this would be a strong point for recruiting more people and being able to

keep them near their homes.

A third area within the training program is that of creating programs which can train teachers at the college level. There are only three doctoral programs in speech and hearing in the region. So we need to expand the present ones, and create new doctoral programs by building up the master's level programs that we have. We are not now training enough people in the South to staff the programs that are already in existence at the college level.

Under the facilities needed for more adequate services, I will just go down through and list some of the types of things without discussing the details or the evidence for these. To a large extent, however, there is little or none of the kind of thing that we are referring to.

We need comprehensive centers for diagnosis and intensive treatment of severe problems of speech, hearing, deafness, language disability, and the associated problems. There is a need for short-term

residential centers for those with severe problems.

We could make very good use of mobile clinics for screening, case finding, and preliminary diagnosis. The purposes of this kind of mobile clinic would cover many areas of need. For instance, it could inform the public more adequately through giving them information and demonstration locally. It could aid in the recruitment through this local demonstration. It could help in incidence studies, determine how many of all types of communication disorders we have. It could assist the communities and school systems in setting up programs for the speech and hearing handicapped, and it could provide some needed services for rural areas.

There was a stated need for more vocational centers which could accept deaf for training. There is also a need for preschool clinic centers, for early detection, parent counseling and prevention.

In the area of public information, a great deal needs to be done. One of the most serious weakness in the field is that so few people understand the nature of communicative problems, how they can be helped, where they can get this help, what kinds of help should be sought, and what opportunities this area offers for rewarding careers.

Furthermore, children and adults with problems could be helped substantially more with present facilities and personnel if parents

and teachers could assist more and if a concentrated, coordinated effort from all needed professions could be made. Therefore, we felt that it would be appropriate for the Federal Government to support two kinds of conferences or intensive workshops—those that would be used for informing parents and other professions about what can be done in this field, and another kind for developing procedures for coordination of professional and therapeutic services in localities and regions.

I will not dwell in detail on the area of research, but this is a primary area for lasting and important contributions on both a longand short-term basis. Principal support is needed to pay especially trained personnel, travel funds to get into the field over a wide geo-

graphic area, clerical assistance and statistical services.

There are three facts in our report that point up the importance of additional support for children and adults who have oral com-

munication handicaps;

(1) Speech disorders affect all aspects of a person's life, from early childhood to old age, while he is learning, earning a living, or engaging in social contacts. Serious problems can cause real personal tragedy.

(2) The numbers of those needing help exceed all other types of

handicaps.

(3) Most of these people can be helped significantly but are prevented from receiving this help because of insufficient and inadequately trained personnel, scattered facilities, and ignorance concerning the

All of us in the workshop session wish to express our appreciation to the subcommittee for your interest in helping the speech and hear-

ing handicapped.

Workshop Report on Speech and Hearing Disabilities: Chairman, Stanley AINSWORTH; COCHAIRMAN, MRS. MARGARET L. WASHINGTON; RECORDER, FREEMAN McConnell; Key Members, Lloyd Graunke, Mina Thurman

The section on speech and hearing disabilities met in its first session at 10 a.m. on Monday, January 25, 1960, in the Henry Grady Hotel in Atlanta. Mrs. Margaret Washington opened the first session and asked for self-introductions of all participants present. Dr. Ainsworth spoke next on the purpose of the workshop. He stated that it was the duty of this section to formulate a statement of the needs in the field of speech and hearing in order to give Congress a clearer picture of ways in which Federal assistance can alleviate the current problems. The group is asked to define specific needs and to indicate those which it is felt the Federal Government can reasonably undertake to help solve. Dr. Ainsworth pointed out that for our discussion persons with speech and hearing disabilities would include the deaf, the hard of hearing, and the speech handicapped. He reemphasized that service for this group of the population is needed at all age levels from birth to death.

The first session was used in order for each participant to express specific needs as seen by him. The areas of discussion fell into the several major divisions listed below, followed by a summary of the general statements of needs

expressed:

I. Case finding.

II. Training of personnel.

III. Coordination of services. IV. Financial problems.

A total of 29 persons registered during the 2-day workshop.

I. CASE FINDING

Although there are educational facilities in each of the States for education of deaf children, the deaf children themselves are often not discovered at an early age nor even by the age of six. Educators in the State schools find it difficult to meet their needs because many are not reported to the schools.

The decisions concerning hearing screening programs often lack uniformity from State to State, as well as from one section of a State to another when not coordinated by a State agency. Different estimates of incidence are obtained because of variations of techniques for screening from one section to another. The need for adequate and effective hearing conservation programs is one of the big needs in the field and perhaps can be met only through much better coordination of State agencies.

Preschool children are seldom included in any of the existing hearing conservation programs. Since this age period is one when the most effective habilitation can be done from the standpoint of preparatory education, speech and language development, and prevention of later permanent hearing damage in the case of hard of hearing children, much more attention should be focused on

means of finding preschool children with speech and hearing handicaps.

Programs for case finding are often segmentally approached. Few States have testing programs in speech and hearing at the high school level, yet findings from some surveys show that a large number of adults with hearing impairment date the onset prior to 15 years of age. It was reported that the mean age at which hearing impaired clients were served by vocational rehabilitation is in the late thirties.

One participant who attended the May 1959 Washington Conference sponsored by the Public Health Service and OVR stated that the emphasis on beginning impairment of hearing was strongly reenforced at that Conference. Present programs often find those who already have noticeable problems, but beginning problems of hearing loss are seldom discovered, particularly at the high

school level.

Public education of all persons concerned—teachers, medical and rehabilitation personnel—is needed in order to call attention to the number of cases needing help and what can be done for them.

There is a need for investigating the possibility of self-administered tests in this area to circumvent the problems of cost in personnel and time now required.

II. TRAINING OF PERSONNEL

There is a need for assistance from Government agencies in recruiting personnel to take training in speech and hearing. It was suggested that actual promotional activities in each State would greatly enhance the obtaining of students to go into this field. Persons trained in speech and hearing to work chiefly in public relations, and public education and orientation would be very valuable.

Another problem is that many present clinical workers in this field are quite lacking in competence because the pressure for personnel is so great that poor standards are being established in many programs through employment of inadequately trained persons. This conclusion was quoted from the report of the Governors' Conference on the Handicapped in Texas. Dr. Bangs also pointed out that the same report indicated that in this field greater recognition of the need for training of personnel to work with preschool children is drastically needed.

Few vocational counselors have been adequately trained or have had sufficient experience with clients who lack ordinary communication ability. Therefore, the deaf clients and those with language deficit, such as the aphasic, are often not served adequately through present vocational rehabilitation facilities. was suggested that each region within a State should have at least one vocational counselor who is able to use the manual language in communicating with the deaf, and that such a person also have specific training in dealing with those who have other language handicaps.

Psychologists whose skills are needed in the evaluation of persons having these disabilities are frequently inexperienced with such problems. Very few States represented reported having access to psychologists with adequate experience in working with the deaf to accomplish a thorough appraisal of a client's potentialities-intellectual, vocational, social, and personality. There is a need for Federal grants, therefore, to support residency training in speech and hearing to help educate psychologists as well as Ph. D. level speech and hearing personnel.

Undergraduate training in speech and hearing needs also to be strengthened. Federal legislation presently bars a number of smaller institutions from receiving assistance in this field because such institutions do not have graduate

programs.

Many teachers of the deaf are presently inadequately trained. The number of trained teachers in each State is in the minority. However, the present training centers, although few in number in this region, are not training the maximum number they could. This fact emphasizes that recruiting of people into the field of educating the deaf is a major need. It was pointed out that the critical shortage of teachers of the deaf and the great difficulties in recruiting students might indicate that we should have Federal assistance to support institutions who train teachers of the deaf at the undergraduate level, although Federal assistance is generally reserved for programs at the graduate level where greater quality programs can be assured.

III. COORDINATION OF SERVICES

No one single agency can handle all problems of the speech and hearing disabled since the handicap pervades all age levels, from the nursery-age child to the aged adult. The problem is one, therefore, which transcends any one group or organization. It becomes more important for us to coordinate existing facilities so that all age levels can be adequately served. There is a need for coordinating personnel at both State and regional levels within each State.

In many States trained personnel is the main lack. Even if the cases are found there is still no way to take care of them. Training centers are in-

adequately staffed.

More emphasis needs to be placed on prevocational training, which can only be accomplished through better coordination of educational and vocational rehabilitation agencies. The needs of the child from 12 to 16 are frequently handled entirely through an educational or clinical type rehabilitative placement. It is in this period of a child's life that he and his family need excellent counseling with careful planning for his vocational future.

Throughout the southern region services tend to be spotty, with quite adequate services in certain sections and very inadequate services in others. Rural

areas suffer from the lack of available facilities.

IV. FINANCIAL PROBLEMS

In many instances State support is not obtainable because of restrictive limitations in school regulations and legislative acts. The average daily attendance law of school systems sometimes prohibits the employment of speech and hearing specialists in the schools. There is a great need for legislative uniformity and a better appreciation for the kinds of services needed so that children and adults are not excluded from a service because of a technicality in the regulations.

Funds are greatly needed for physical facilities, treatment centers, and resi-

dential centers throughout the South.

SUMMARY OF PRELIMINARY DISCUSSION

The chairman summarized the first morning session to focus on the several areas of discussion.

1. Services

Screening and diagonstic services at all age levels is one of the important needs in this field. These services must include the preschool child as well as the aged adult and the teenager. There is a need for coordination of existing services and addition of provisions or revision of certain regulations now which tend to exclude persons from assistance. The appropriate medical, educational, therapeutic, social, and vocational adjustment followup is necessary for all age levels.

2. Personnel

Recruitment of personnel is an important need for the southern region. Personnel are needed to test, treat, consult, and coordinate. Training of personnel is an urgent need also. The field needs many levels of workers work-

ing within many frames of reference and in many types of positions. The speech and hearing worker is not exclusively a public school worker no more than he is a public health worker, or a university clinic worker, but first of all he is a specialist in the field of speech and hearing and deafness. need to be training centers in all States, and particularly more training for preschool workers. We have a need to recruit personnel to fill to their maximum the training centers that are now in existence. We need to expand present programs of training and stimulate new programs to supply more and better trained indviduals at all levels. Federal assistance is needed to stimulate undergraduate training in teaching of the deaf and training at the master's level, the Ph. D. level, and the post-Ph. D. level in speech pathology and audiology. Residency training programs in medicine and for other allied disciplines is urged to enable these workers to make their major contribution to this disability field through a better understanding of these problems and how they are handled.

3. Physical facilities

Clinical facilities should be expanded and Federal help may be needed for both equipment and construction of plants as well as for mobile clinics. Early detection and prevention through improved facilities is an important need.

4. Research

There should be studies between States and within States supported by the Federal Government to see how existing services can be coordinated to help those with speech and hearing handicap. There is a great need for a study of the variations in State support and a need to clarify differences between different types of workers in our field. There is a need for broadly conceived leigslation which meets the needs of those in speech and hearing, including the multiple handicapped who have speech and hearing problems. There is a great need for research of many types to enable us to understand better the nature of communicative disorders and their management.

NEEDS OF THE DEAF

The chairman and cochairman opened the second session with the statement that it would be best to explore together the needs in the field of the deaf first, followed by the needs in the fields of speech defects and hearing impairment. For purposes of clarification an orienting statement was compiled as follows:

The deaf.—The deaf are those who because of hearing impairment require the special recognized techniques and services for their educational, social, and vocational adjustment. The use of the term "deaf" will be construed to mean those in whom the sense of hearing is so severely impaired that the acquisition of speech and language in the normal manner is not possible; hence, adjustment to their environment must be by utilization of faculties other than the sense of hearing. The deaf, therefore, are those in whom the sense of hearing for all practical purposes is nonfunctional in life, with or without a hearing aid. The great handicap of deafness is one of language, since their ability to communicate is highly restricted and for most, oral communication is impossible without the aid of lip reading. Many are unable to communicate at all except in the manual language, and a considerable number of untrained deaf are seriously limited in any form of language communication.

The experience of the group in this field indicated that most are agreed that the incidence of deafness in children is about 0.3 percent of the school-age population. This is the group whose hearing impairment is so severe as to preclude the acquisition of speech and language in the normal manner, and for whom special educational placement is necessary throughout the major portion of school life to permit full development of their capabilities and their maximum personal and social adjustment.

I. PROBLEMS IN PROVIDING SERVICES FOR THE DEAF

A. Acute shortage of trained personnel

The handicap of severe deafness requires specialized services from birth throughout life. Present services are frequently structured so that wide gaps in the age span of services to the deaf person prevail, leaving him without assistance from any existing Federal, State, and local resources during specific periods of his life. For the deaf child, early detection in the first year of life is of paramount importance in beginning the long-range program to enable him to participate maximally in society as an adult. Thus, diagnostic personnel whose efforts and evaluations are closely integrated with the fields of otology, pediatrics, neurology, speech pathology, and psychology are sorely needed in the South. Such specially trained personnel in the speech and hearing field are-

1. Audiologists, who must provide thorough appraisal of the auditory status and potential of a child or of a given individual. Periodic evaluation of the hearing status throughout life is required for the deaf child whose growing use of residual hearing influences the type of education, vocational,

and other services required.

The audiologist is an acutely needed specialist throughout the southern region. Each school for the deaf should have at least one audiologist on its staff. At present, none of the State schools in the southern region have such a person, but each of the superintendents of schools for the deaf present indicated that he needed such a person. An immediate need for schools of the deaf was 20.

Present vacancies in university clinics and in community and hospital speech and hearing clinics were estimated as follows: 6 each in Tennessee, Virginia, Georgia, South Carolina, and Alabama, and 20 in Texas, or a total

of 50.

- 2. Preschool teachers of deaf children to develop communicative skills essential to learning and social participation during the period in life when the child is most receptive to language formation and development through oral means. It was previously mentioned that most of our present training centers for teachers of the deaf do not give experience with preschool children, and this specialist is now one of the most acutely needed in order to handle effectively the deaf child's problem. Only three institutions in the southern region offer training experience to teachers of preschool children. A maximum of 10 at any one time are being trained in the South, and most of these are being employed in the places where they are trained. Such training is given at the University of Oklahoma, at the Bill Wilkerson Hearing and Speech Center affiliated with Peabody College and Vanderbilt University, Nashville, Tenn., and the Houston Speech and Hearing Center in Texas.
- 3. Teachers of the deaf for school age children are needed to provide the educational services plus the speech, language, and auditory habilitation that go hand in hand with the special teaching of academic subjects, and which must be taught by a specially trained and skilled teacher. The teachers of the deaf at present fall far short of the demand. Most superintendents present reported that they must now employ teachers who do not meet the existing requirements. A number of schools are staffed with older teachers now facing compulsory retirement and there is no one to supply their vacancies. It was estimated that from 25 to 50 percent of teachers in the residential schools for the deaf are not certified by the Conference of American Executives of Schools for the Deaf. Superintendents from Alabama, Tennessee, North Carolina, and Georgia reported that from 10 to 12 percent of their teachers are ready to retire in 5 years. Presently not more than 8 to 10 teachers of the deaf a year are being trained in the South.
- 4. Vocational counselors who have special training, in-service or otherwise, with language deficiency are needed. Consultants in speech and hearing services to include deafness, with a minimum of one consultant of each State office, would help solve the problem. Such a person could train other counselors, but there should be an emphasis on training counselors to handle language disabled clients, both those who are deaf and those who are aphasic or have other receptive difficulties in communication. present situation is one in which many deaf adults feel they cannot be served. One participant pointed out that many deaf believe they can get no help from vocational rehabilitation.

5. Psychologists. At least 55 psychologists who have had training with deaf persons are needed in the South. At present there are less than 10. An estimate from 1 source indicated that only 50 psychologists in the United States are trained to test deaf persons. It was estimated that at least 6 psychologists are needed in Georgia for adults, 6 in Tennessee, 3 in South Carolina, 3 in Oklahoma, 4 in Alabama, 4 in North Carolina, 3 in Louisiana, 5 in Alabama, 10 in Texas, and 5 in Virginia. Psychologists who have specific training with the deaf to enable more adequate evaluation of intellectual and personality characteristics of the deaf person are greatly needed.

both in schools and in adult rehabilitation programs.

6. Social workers, medical and psychiatric, to assist in the planning for families of deaf children and deaf adults are also specialists greatly needed in this field. Not more than five social workers are now known to be working with deaf persons in the southern region. At least 20 are needed immediately in agencies such as Crippled Children's Service, schools for the deaf, and clinics.

B. Services for the deaf

1. Mobile clinics.—It was recommended with case finding activities mentioned earlier that Federal funds are needed to support mobile clinics in establishing uniform screening and hearing conservation programs in all States. The mobile clinic would serve for screening, case finding, and preliminary diagnosis, as well as a public education device in the problems of speech, hearing, and deafness. They would provide information for incidence studies in sparsely settled areas, furthermore, and would clarify many unanswered questions on incidence

by regions and States.

2. Preschool facilities.—There are no more than 10 to 15 preschool facilities in the South at present which purport to train deaf children. States generally do not provide public education funds for preschoolers. Since the deaf child's education must begin as early as possible, from 18 months to 2 years of age if no other handicaps exist in addition to the deafness, it appears that adequate public educational opportunity is often denied the preschool deaf child. A greater number of well staffed preschool programs would do much to reduce the number of children needing full-time educational placement later on. It is important to point out that many young deaf children are functionally deaf, and with special training they may be able to transfer to the category of the hard-ofhearing child. A 55- to 60-decibel loss at birth may result in a condition of functional deafness in a child, who if given special training through nursery and kindergarten programs taught by a well-trained teacher of the deaf may by the age of 6 to 8 be able to become a hard-of-hearing child making more nearly maximum use of his residual hearing. Had he had no training in the early years, however, by the time he was 6 when most residential schools are able to take him, he would have functionally lost the use of his hearing so that he might well function the rest of his life as a severely deaf person with perhaps very limited oral language.

3. Other types of services.—Uniform laws at the school-age level and at the preschool level are needed to provide opportunities for day-class programs in a far greater number of cities. Vocational schools which will accept deaf children are also greatly needed throughout the South and a larger number of opportunities for employment. The deaf person can become an independent, contributing member of society. Too many deaf persons are not given adequate opportunity for an education and become wards of society because such opportunity.

tunities are either not open or are not known to their families.

C. Coordination of services

1. Continuing support of facilities is greatly needed. It is the experience of many participants in the workshop that establishment of programs are often possible with Federal funds but, because a means of supporting personnel cannot be assured, it is very difficult to staff a program. Thus continuing support is needed to assure quality services in personnel. While this may not be a responsibility of the Federal Government, there should be a study of how continuing support can be assured to those clinics and services now existing so that they can meet the needs they are capable of meeting if they could have staff.

2. Coordination of facilities.—A great need is the transition between education and vocational rehabilitation. Even when satisfactory educational placement is obtained, there is often no vocational advice prior to the child's leaving school. There is a great need for trained personnel in the trades areas to work with the deaf, both at State and National levels. The 12- to 16-year age span is crucial for making the transition between education and vocation for the deaf child and families need assistance with this planning. There is a need for studies to see how this can be better coordinated than it is at present. This is the age when the educational placement becomes inadequate and when vocations are the second of the planning of the plann

ional planning is often not possible. However, a greater exploration of opportunities and potentialities of young deaf people entering their teens would do much to alleviate present inadequacies in this program.

II. TRAINING OF PERSONNEL

A. Recruitment

One of the biggest problems in training personnel to work with the deaf is recruitment. Present programs for training teachers of the deaf are not working to full capacity. It is much easier to attract young people into the allied fields of speech pathology and audiology than into teaching the deaf. Six of the training centers in the southern region which are credited by the Conference of American Executives of American Schools for the deaf have no students. North Carolina has 6 students and could train 20. Tennessee trains from 5 to 10 persons a year. Texas has none at present.

B. Trainecships

Traineeships to encourage young people to go into this field are needed. Because of the critical shortage of teachers of the deaf, it is the opinion of this group that funds for teachers of the deaf are needed at the undergraduate level. The present need for teachers of the deaf cannot be filled unless we draw upon undergraduate workers. The teaching of the deaf curriculum leads itself to undergraduate levels, and the bachelor's degree represents a sufficient academic proficiency level, since in this field diagnostic skills are not as important as teaching skills.

C. Training emphasis

Training centers today much more than in the past should emphasize in their training programs the utilization of hearing potential in children.

D. Training grants

There is a need for grants to institutions to finance education of the deaf programs. It is recognized that it is difficult to train large classes of teachers of the deaf, and thus this type of training will always be expensive and may require subsidization. Additional centers, other than the three approved by the Southern Regional Education Board, are felt to be needed if we meet the critical need for teachers of the deaf. Institutions need funds to staff them with continuing support assured if we are to meet this great need. It is recommended that the preliminary work done by the Southern Regional Education Board be utilized and their recommendations on programs for teachers of the deaf be implemented.

III. FACILITIES

A. Audiologic facilities

Audiologic facilities in residental schools for the deaf are needed, as well as in many more community, university, and hospital clinics, for the diagnosis and appraisal of deaf persons. Such units, working with preschool special classes, school age day classes, residential schools, and vocational and psychological services in a community, are potentially of great value in alleviating the problems of deafness.

B. Residential facilities for the adult deaf

A report from the recent Fort Monroe Vocational Rehabilitation Conference concluded that deaf adults are not able to fit into existing rehabilitation centers, which are often more specially designed for the orthopedic and other motor handicaps. It was suggested that special rehabilitation centers for the adult deaf be established on a regional basis, with both outpatient and inpatient facilities. Such centers could be appended to those which are already existing or could be a separate facility. The important point to the stressed is the uniqueness of the adult deaf person who cannot communicate readily through hearing, making his communication problem so great that the regular type rehabilitation center program is not able to meet his needs. We are not meeting the needs of this segment of the adult population and must make greater efforts to do so.

IV. PUBLIC AND PARENT INFORMATION

There is need for financial assistance in the preparation of public education material, including brochures and exhibit materials.

Federal assistance for regional workshops were recommended to train personnel to conduct local workshops. These should include nurses, psychologists,

and community agency workers.

There should be more emphasis on speech and hearing and teaching of the deaf on high-school carrer days. There is need for exhibits, films, brochures, posters, and photographs, all of which are expensive and often not possible in in the ordinary budgets of training institutions.

NEEDS OF THE SPEECH AND HEARING HANDICAPPED

The needs of the population with speech problems and with hearing problems less severe than those implied by the term "deafness" will be considered simultaneously in the discussion below.

ORIENTING STATEMENT

For purposes of the discussion below, "speech problems" will imply expressive problems of communication resulting from such organic disorders as cerebral palsy, laryngectomy, cleft palate, and voice pathologies, or from functional problems such as delayed speech reflected in infantile speech patterns and production, from articulation errors of substitution, omission, and distortion of speech sounds, and from stuttering. Hearing impairment here includes all those who have a handicapping hearing loss for speech, but whose residual level of hearing is sufficient to be utilized effectively in communication, if specially trained and if special aids such as hearing aids, lip reading, and auditory training are made available and utilized effectively.

INCIDENCE

Incidence of speech problems at the preschool level are not known and this group questioned the reliability of available estimates. The participants agreed that incidence of speech problems in the 5- to 19-year-age group is about 5 percent in the southern region and over 19 about 3 percent. The incidence of hearing handicap, in addition to the deaf mentioned earlier, was agreed to be about 1 percent of the school-age population.

A report on a special study in the State of Virginia in 1953 revealed that of an estimated incidence of 10.565 hard-of-hearing children, only 1.139 were actually revealed through school and health records. This estimate was based on incidence studies on a national level and can be relied upon as being reasonably accurate. Therefore, local, State, and community agencies failed to reveal the

existence of these nearly 9,000 children in 1 State.

Estimates of incidence among the preschool-age group were not felt to be reliable. Estimates of adult incidence vary widely, dependent on where we define the level of bandicap to begin. The group thought that about 3 percent of the

adult population would need audiologic services.

The handicap of hearing loss is importantly related to age of onset. A mild hearing problem may be quite severe in its effects on a young child, although not nearly as apparent in an adult who has well-established speech and language proficiency. Beginning hearing impairment, mild, moderate, and severe levels, are all included in incidence. A large group of the adult population acquire bearing impairment not only from causes such as otosclerosis and other types of ear disease, but also from such sources as industrial and military noise exposure. Incidence of hearing impairment is quite great in infancy and early childhood when ear infections and middle-ear diseases are quite prevalent, resulting often times in permanent hearing impairment. Incidence of hearing loss tends to decrease at puberty, but rises again in the late teens and through the twenties and thirties, as a result of otosclerosis, a disease of the middle ear causing a bony growth formation impeding sound passage, and affecting about 0.1 percent of the population. The incidence of hearing impairment beyond the thirties decreases until after 50, after which time it becomes markedly on the increase with each year of increasing age. The causes of hearing impairment resulting in damage to the hearing nerve are legion and may result from sinus, colds, flu, or any disease in which there is high temperature or from any condition of toxicity in the body. These types of hearing problems are not confined to any one age group.

I. PROBLEMS IN PROVIDING SERVICES FOR THOSE WITH SPEECH DISORDERS AND HEAR-ING IMPAIRMENT

A. Personnel necds

1. Estmate of present shortage.—Needs for specially trained personnel in speech and hearing were estimated by the various persons present. A conservative estimate of vacancies for positions which are now budgeted was 390 in the States represented. The State of Florida has a need for as many as 75 persons at present, North Carolina 50, South Carolina 10, Virginia 20, Alabama 10, Tennessee 50, Mississippi 15, Georgia 30; in the State of Texas last year 220 units in school sytsems were set up but only 90 were filled. These vacancies represent positions for which budgets have been established or would readily be established if a trained person became available, and do not include anticipated future needs. In Atlanta, Ga., the speech clinician-student ratio was estimated to be 1 per 11,200, in Fulton County 1 per 12,600, and in DeKalb County 1 per 21,000. Obviously, these school systems are inadequately staffed at present. Many areas of the South are completely without services of any kind. South Carolina has 1 speech specialist to every 30,000 schoolchildren.

The need for audiologists who specialize in the diagnosis and rehabilitation of the hearing impaired has been discussed above under personnel needed in the area of the deaf. It was the opinion of the participants in this section that as services in these special fields are made available, the need for personnel increases. Therefore, present estimates are minimal and in no way are considered

representative of future needs which will be much greater.

2. Need for advanced level personnel.—This group wishes to emphasize that personnel at advanced levels are needed in the South where those with advanced training, particularly, are in critical shortage. Speech pathologists and audiologists with advanced certification are needed in medical centers, where it is important that the profession be represented with capable persons highly trained, who can work independently and integrate their skills effectively with those of other disciplines, rather than under the direction of and supervision of other disciplines.

3. Staffing mobile clinics.—It was further pointed out that with the recommendation that mobile clinics be established throughout the region to assist in incidence studies, public education, and bringing speeach and hearing services and specialists to outlying communities, additional personnel would be needed to staff such clinics. Existing clinics and centers could not spare their personnel to do such work, which would require setting up full-time positions under one of

the State agencies, probably.

4. Electronic and acoustic technicians.—A generally unmet need in all schools for the deaf and university and community clinics is for electronic and acoustic technicians. This type of personnel is greatly needed in the proper administration of clinical and educational programs utilizing modern and highly specialized electronic and technical equipment, from the standpoint of services as well as in research and training of students to work in this professional field. Federal assistance here would be helpful in establishing such a precedent since many budgets do not support this type of staff person.

B. Services for those with speech disorders and hearing impairment

1. Needs of the hard of hearing child.—While in most cases education in the regular classes for the speech defective child is possible, the child with a hearing loss more often needs special educational placement. The plight of the hard of hearing child was felt by some participipants to be extremely serious. He is said to be the forgotten child, since many school systems and State departments fail to recognize his problem. Hard of hearing children often grow up as deaf children because of inadequate programs for their education. There is a need for special classes in the public schools for this group in almost every county. This provision would relieve much of the load on residential schools for the deaf, which could then direct their efforts for the more specific purposes for which they were established—the severely deaf. It would be assumed that the improvement in the education of the hard of hearing individual would tend to reduce the need for intensive rehabilitative services later. While many of the hearing impaired children are able to attend the public schools, they will frequently and most often need special classes in the early years of their school life until language is well established. There is much research evidence which substantiates that the child with even a mild to moderate hearing loss is often deficient in language development. Therefore, the schools need persons especially trained in hearing to work with this segment of the population, whose need is language habilitation.

It was estimated that at present there are not more than five to six programs in the southern region for public school special classes for the hard of hearing child. The four known ones are located in Nashville, Baton Rouge, New Orleans,

and Memphis.

2. Need for more and better diagnostic and treatment centers for speech and hearing disorders.—There is a great need for more comprehensive diagnostic and intensive treatment centers, which are now widely scattered, and many are inadequately staffed to evaluate thoroughly the various speech and hearing disabilities. Cooperative efforts between education and vocational rehabilitation to integrate their planning for speech and hearing handicapped individuals is also of paramount importance in helping these persons make their maximal adjustment to society upon reaching adulthood, as well as assisting those who acquire problems of communication as adunts.

C. Coordination of services

It is important to coordinate services now existing so that close cooperation with medicine and other disciplines is maintained. Adequately coordinated and effective case finding and program planning require an increased number of well trained persons placed in education and health services and agencies in each of the States. Appropriately trained speech and hearing personnel in the departments of education and health, for example, would assist in training and orienting other disciplines to these problems. A large number of persons with speech and hearing disabilities are now not being referred to existing facilities, and many referral sources are not taking advantage of early assistance. The aphasic, the postlaryngectomy patient, as well as young children with deafness and organic speech difficulties, all can make the most gains if detected immediately and if programs of habilitation and rehabilitation are begun at the earliest possible time, as judged by competent speech and hearing personnel.

II. TRAINING OF PERSONNEL

A. Introductory statement

There is a basic core of knowledge which permeates the training of all persons working in any of the three areas of communicative disorders—speech pathology, audiology, and education of the deaf. Whether a position is held in public schools, clinics, hospitals, health and voluntary agencies, or community centers, there is a common core of information for all workers.

B. Explaining and broadening staffs of training departments

Training programs need to be expanded in several dimensions. There should be broadening of the training staff to include faculty members well trained in both the speech and hearing fields. Every training program should be staffed with personnel holding advanced clinical certification in the American Speech and Hearing Association and/or training at the doctoral level.

Every training program should be able to offer a curriculum preparing students

for advanced certification in one or both areas-speech and hearing.

Training institutions with one or two faculty members who represent all areas in communicative disorders are inadequate. Faculties should be increased both to provide a higher level of clinical competence in graduates and to anticipate results of improved recruitment methods bringing larger enrollments. Departments should be graduating more persons competent to staff other training programs.

It is specifically recommended that each training institution broaden their training to include more work in hearing and that we develop hearing specialists in the training programs. Comprehensive training centers, which include work in education of the deaf, speech pathology, and audiology in one department

dealing with communicative disorders, are highly recommended.

C. Provision of advanced graduate training

Federal assistance is urgently needed which would (1) improve present programs offering graduate instruction and (2) make possible the establishment of new programs of graduate study. There is particularly a great need for more doctoral programs in the Southern region. It is noted that only three institu-

tions in the Southern States represented are now giving a doctoral program in speech pathology and none in audiology. These programs cannot possibly fill present needs for advanced level personnel.

III. FACILITIES

A. Residential programs

There is a need for short-term residential facilities for persons with severe speech handicaps where intensive training may be obtained. Such facilities might well be part of such a similar facility recommended for the deaf. One director of a hearing and speech center estimated that 90 percent of adults seen cannot be handled adequately without residential treatment, and that 30 percent of children cannot be adequately handled. In other words, the severer problems require more intensive treatment than present out-patient treatment facilities Regional residential centers would also provide more complete and adequate rehabilitation for individuals in outlying areas. The success of the few facilities available (summer camps for children) testify to the value in terms of conservation of human resources.

B. Mobile clinics

The need for mobile clinics has been previously discussed. This type facility would enable any citizen of any age to bring his problem to a trained person, from whom he would receive preliminary diagnostic service and counseling on what he might anticipate in the way of assistance with his problem. Furthermore, such mobile clinics would contribute to accurate studies of incidence of speech and hearing problems which at present are vague. Mobile clinic staff personnel could assist in setting up new programs in communities and public schools

C. Continuing support

It was recommended that supporting grants be made to clinics newly built for the first year to take care of the resulting additional case load. In construction of new facilities or expansion of existing physical facilities, provision needs to be made for assistance similar to that through the Hill-Burton Act. Federal assistance is also needed for equipment to provide proper diagnostic and intensive treatment, since the equipment needed is both highly specialized and expensive.

IV. PARENT INFORMATION AND PUBLIC EDUCATION

Here the same recommendations as were made for the deaf would apply.

SUMMARY-AREAS IN WHICH FEDERAL ASSISTANCE IS RECOMMENDED

I. Training of personnel

A. Student traineeships.—It is recommended that traineeships be made available to students who wish to prepare in this professional field.

1. In the area of the education of the deaf a critical need for special classroom

teachers exists. It is the opinion of this section that the shortage is so critical as to require the support of students at the undergraduate level. In addition, graduate scholarships and fellowships are also needed.

2. In the fields of speech pathology and audiology substantial scholarships should be made available which would attract students into this field for gradu-

ate study at both the master's and Ph. D levels.

3. Funds are needed for the continuing professional advancement of, and increased competence in, personnel who deal with speech and hearing disabilities, through programs of postdoctoral residency study in qualified training centers.

B. Training grants to institutions.—The critical shortage of personnel, together with the great cost of training specialists in the fields of deafness and speech and hearing disorders requires some form of Federal assistance in the ways of training grants to institutions themselves. Grants are needed for faculty, for specialized and highly technical equipment used in evaluation of speech and hearing problems and for graduate research, and for improved or new physical facilities. In addition, funds for recruitment endeavors are needed. This support should include funds for exhibit materials and brochures for which budgeting is often impossible through regular channels. These training grants should allow for-

1. The improvement of training centers now in existence, and

2. The creation of new centers.

II. Problems of increased services

A. Mobile clinics.—It is requested that there be some form of Federal legislation to employ such facilities as mobile clinics which could be used in screening, case finding, and preliminary diagnosis of speech and hearing problems. The purpose would be threefold: (1) To educate the general public regarding speech and hearing problems and what can be done to remedy them through bringing the specialized personnel into outlying communities, (2) to gather data for incidence studies which could be more accurately gathered throughout a State or region to determine the true proportion of speech and hearing handicaps, and (3) to assist in recruitment of personnel to the professional fields of speech and hearing.

B. Diagnostic and treatment centers.—Federal assistance is also recommended to assist in the establishment of more comprehensive diagnostic and intensive treatment centers, to include physical plant construction, equipment, and temporary support of staff. Further, it is recommended that short-term residential facilities be established for those persons with speech and hearing impairment for whom the ordinary rehabilitation center is not appropriate. a few such short-term programs demonstrates the value to rehabilitation, and while the initial cost is great, the economic returns to the community and to society outweigh these costs. Present clinics working on an outpatient basis cannot serve this rehabilitation need. Such facilities provide group therapeutic values which can only come from the supportive opportunities provided.

In addition, it is recommended that there be special adult rehabilitation facilities for the severely deaf not presently rehabilitable to provide training in social acceptance, emotional, vocational adjustment, and communicative skills. These persons with this type of communication handicap do not fit into the ordinary

concept of the comprehensive rehabilitation centers.

C. Continuing support.—Federal funds for contractual grants to assist smaller clinics during an initial period of 3 to 5 years to enable them to enlarge staff to provide the much needed services which present facilities do not permit.

III. Coordination of services

A. Conferences.—Regional conferences should be stimulated through Federal assistance, the purpose of which would be to support interdisciplinary efforts for better coordination of facilities now in existence. Such regional conferences supported federally should train speech and hearing personnel to hold such conferences on a local or State basis.

IV. Research

A. Incidence.—Present estimates of the incidence of speech and hearing problems vary widely from report to report. A more valid study of incidence to include both urban and nonurban populations regionally is recommended for a national federally supported project.

B. Area.—Basic research in audition, speech, and linguistics.

C. Research studies.—1. To demonstrate the value of better coordination of education and vocational planning in consideration of the long-term needs of an individual.

2. To determine the value of comprehensive regional facilities for the adult deaf who have had little or no previous assistance.

3. To determine the language and vocational prognosis for brain injured, aphasic, and other seriously handicapped who need long-term treatment. D. Development of diagnostic tools.—1. Psychologic instruments suited to

those without language.

2. Self-testing devices to make mass screening programs more economical of time and specialized personnel.

Mr. Fleiott. Thank you, Dr. Ainsworth, for a fine report.

Mr. Geer. The cochairmen of the section on chronic disabilities were Mr. E. B. Bowman, executive director of the Mobile Rehabilitation Association, Inc., Mobile, Ala., and Mr. W. R. Burris, supervisor of the department of education, Jackson, Miss.

The spokesman will be Mr. Burris, a very capable supervisor, from

Mississippi.

Mr. Elliott. We are happy to have you, Mr. Burris, and look forward to your report.

STATEMENT OF WAITUS R. BURRIS, SUPERVISOR OF SPECIAL EDU-CATION, STATE DEPARTMENT OF EDUCATION, JACKSON, MISS.

Mr. Burris. Mr. Chairman and members of the committee, it is pretty obvious that at the midway point of these reports there is quite a bit of duplication and probably overlapping. I assure you it was not intended that way, as not one of us in the different committees knew what was transpiring in the others. For the sake of emphasis, perhaps, I will go ahead with the summary of the items as they were discussed and unanimously agreed upon in our group.

This report deals with a realtively large number of persons who are handicapped by disabilities of such severity and length or duration that they require special assistance to be raised or restored to a condition of independent living, vocational and social adjustments,

or educational competence.

It might be noted that although there is some overlapping, this is

not designed to be that way.

Enthusiastic agreement and support were given to the following observations and recommendations: It was recommended that there be developed in Federal legislation or by expressed intent provisions for advisory groups on the National, State, and local level to coordinate public and private agencies, organizations and individuals concerned with the problems of chronic disabilities.

No. 2. That there be provided by Federal assistance on a pilot basis comprehensive evaluation, appraisal or diagnostic clinics for persons of all ages, to explore their physical, psychological, social, emotional, and educational characteristics, not to identify weakenesses or abnor-

malities, but to evaluate their full potential.

In addition to the usual community resources, this would require well-staffed facilities where the clients could spend several days and nights as needed to get the required studies, tests, or examinations. After these pilot projects have demonstrated their value in effecting this, further consideration could be given to the expansion of such clinics.

No. 3. That Federal funds on a State matching basis be provided for the construction and equipment of needed education and rehabilitation facilities and sheltered workshops: also, that appropriations be made for the maximum use, support, and extension of such existing facilities.

No. 4. That Federal grants, fellowships, and scholarships be made for the training and teaching of the professional personnel required to adequately staff a comprehensive evaluation or rehabilitation and education facility.

Some of these would be therapists, teachers, psychologists, psychiatrists, nurses, social workers, counselors, administrators, researchers,

and various medical specialists.

No. 5. That laws in the field of social security, public assistance, and workmen's compensation be made to encourage the disabled individual to take advantage of rehabilitation services.

No. 6. That there be a continuation and extension of support for research on the chronically disabled. This might well be done in evaluating the effectiveness of the existing or recommended evaluation of clinics and rehabilitation facilities, and also some definite plan of cataloging and disseminating results of research should be devised.

No. 7. That note be taken and support given to the principle of designing public housing, of public schools and other public build-

ings to accommodate the chronically disabled.

No. 8. That overall Federal legislation be enacted to deal with all types of handicapped persons rather than piecemeal legislation limited

to specific areas of exceptionality or handicap.

No. 9. The section on exceptional children and youth of the U.S. Office of Education is worfully understaffed. It is recommended that the staff be expanded to include specialists in all the various areas of exceptionality so that better service can be given to the special educational programs in the various States.

No. 10. And lastly, to give better service to the chronically disabled and to establish better standards for sheltered workshops there should be an evaluation of existing workshops and a consolidation of com-

munity workshops.

This would provide more economical administration, sharing of professional personnel, and more thorough exploration of contracts, including Federal contracts.

This completes our prepared report. On behalf of the workshop group, I would like to thank you for the opportunity to present it.

Workshop Report on Chronic Disabilities

Your cochairman of the workshop group on chronic disabilities are keenly aware of the grave responsibility placed upon them in conveying to you a report of their deliberations, conclusions, and decisions. This group was composed of very able, sincere, and conscientious men and women representing various areas of care, education, and rehabilitation of handicapped children and adults and acutely sensitive to the needs of such persons. Although the items were thoroughly and intelligently discussed from various points of view the decisions reached were by complete unanimity.

This report deals with a relatively large number of persons who are handicapped by disabilities of such severity and duration that they require special assistance to be elevated or restored to a condition of independent living, vocational and social adjustment or educational competence. Although no figures on a nationwide scientific study of the incidence of persons classified as chronically disabled are available, it is obvious that there is an appreciable and increasing number of them. Educators and rehabilitation counselors, because of the unavailability of personnel and facilities, are constantly faced with the momentous problem of these unfortunate citizens.

The workshop group respectfully invites your attention to the following recom-

mendations and observations:

1. Advisory coordinating groups

There obviously is overlap and duplication in services to the chronically disabled in view of the various independent programs designed to serve them. It is therefore recommended that there be developed by legislation or policy provisions advisory groups on the national. State, and local levels to coordinate public and private agencies and organizations concerned with the problems of the chronically disabled.

2. Evaluation, appraisal, or diagnostic clinics

Before any worthwhile and lasting assistance can be given the handicapped it is necessary to explore their physical, psychological, social, emotional, and educational characteristics, not to identify weaknesses or abnormalities, but to evaluate their full potential. This requires, in addition to the usual commun-

ity resources, well-staffed facilities where the person can spend several days and nights, as needed to make the required studies, tests, and examinations. It is recomended that Federal assistance be given the States on a pilot or demonstration basis to establish, staff, and maintain comprehensive evaluation, appraisal, or diagnostic clinics for persons of all ages.

3. Rehabilitation and education (acilities

There would be little value in evaluation and diagnosis with the present dearth of rehabilitation and education facilities. It is recommended that Federal funds, on a State matching basis, be provided for the construction and equipment of needed rehabilitation and education facilities and sheltered workshops. It is also recommended that appropriations be made to provide for the maximum use, support, and extension of such existing facilities.

4. Grants, fellowships and scholarships

There is a real paucity of trained therapists, teachers, psychologists, nurses, social workers, counselors, researchers, administrators and various medical specialists to staff rehabilitation and education facilities when they are provided. Because of the length and cost of such training few can afford it without financial assistance. It is therefore recommended that Federal grants, fellowships and scholarships be made for the training and preparation of the professional personnel required to adequately staff comprehensive evaluation, rehabilitation and education facilities.

5. Liberalization of laws and regulations

It is often found that handicapped persons are reluctant to enter a vocational rehabilitation program for fear of losing their social security, public assistance or other income, either their own or members of their facilies. It is also found in some instances that second injury clauses in workmen's compensation laws prohibit the handicapped person's securing employment. It is recommended that liberalization of laws and regulations in the fields of social security, public assistance, and workmen's compensation be made to encourage the disabled individual to take advantage of rehabilitation services.

6. Support for research

We are living in an age of increasing emphasis on research to find out the what, why, and how of doing things. More and more the need or justification for action is based on scientific research. There is a great need for study of the problems of the handicapped. There also appears to be a need for cataloging and disseminating results of research so it can be more widely utilized. It is recommended that there be a continuation and extension of support for research on the chronically disabled. Some of this might well be done in evaluating the effectiveness of existing or recommended evaluation clinics and education and rehabilitation facilities.

7. Design and construction of buildings

Note might be taken of the fact that there have been some buildings designed and constructed with the needs of the handicapped in mind. There is no real advantage of steps over ramps except possibly conservation of space in some specific situations, while there is a great advantage to the handicapped of ramps over steps. Also, elevator doors and other apertures should be made large enough to adequately take care of wheel chairs. It is recommended that support be given the principle of designing public housing, public schools and other public buildings to accommodate the chronically disabled.

8. Comprehensive legislation

There is always the danger of having legislation enacted for the benefit of small segments of the handicapped population because of the influence of pressure groups with narrow interests. It is recommended that Federal legislation be enacted to deal with all types of handicapped persons alike rather than piecemeal legislation limited to specific areas of exceptionality or handicap.

9. Strengthening the staff of the U.S. Office of Education

The Section on Exceptional Children and Youth of the United States Office of Education is woefully understaffed. There are few, if any, of its personnel with the time or special preparation to give advice, information or special assistance to the various States. With a full staff of consultants much assistance could be given in collecting and disseminating data from over the Nation, doing

or promoting research, advising with new State programs, and other related services. It is recommended that the staff of the Exceptional Children and Youth Section of the U.S. Office of Education be expanded to include specialists in all the various areas of exceptionality.

10. Standards for sheltered workshops

To give better service to the chronically disabled and to establish better standards for sheltered workshops, there should be an evaluation of existing workshops and a consolidation of community workshops. This would provide more economical administration, sharing of professional personnel, and more thorough exploration of contracts, including Federal contracts.

We deeply appreciate the opportunity of presenting this report and trust it will be of value to you in planning legislation on special education and rehabilitation. We are grateful for your interest and efforts on behalf of the handicapped. If at any time we can be of further assistance feel free to call on us.

Mr. Elliott. It has been a real pleasure to have you, Mr. Burris. Mr. Geer, before you make your next announcement, I see that the probate judge of this county has come into our audience, the Honorable Graf Hart.

Judge Hart, may I thank you for the coffee and refreshments that

you sent up during our recess.

Mr. Geer. Our next section will be the section on the mentally ill and emotionally disturbed. Chairing this group were Dr. Nicholas Hobbs, chairman of the division of human development, the Peabody College in Nashville, and Mr. John W. Forrest, supervisor of special disability services in the division of vocational rehabilitation, in the Georgia Department of Education.

Neither of these chairmen were able to be present today, and so they designated Dr. Warren Findley, a member of that group, assistant superintendent of pupil personnel services of the Atlanta public schools. Dr. Findley has wide experience working with guidance and personnel work of the type that is represented by his group and

will make that report.

Mr. Elliott. We are happy to have you, Dr. Findley. You may proceed in any manner you see fit.

STATEMENT OF DR. WARREN FINDLEY, ASSISTANT SUPERINTEND-ENT. PUPIL PERSONNEL SERVICES, PUBLIC SCHOOLS, ATLANTA,

Dr. Findley. Thank you, sir.

Mr. Chairman and members of the committee, this section on special education and rehabilitation of emotionally disturbed children began its work by seeking a definition of emotionally disturbed children, since this is an area that is in some ways new, and in which this term is used variously. We were fortunate to find and to be able to adopt a rather simple and straightforward definition given by Dr. Lois Murphy, of the Menninger Foundation, at a meeting of the North Carolina Conference on Handicapped Children in 1958, which was devoted to the emotionally disturbed child.

She states:

By an emotionally disturbed child, we ordinarily mean a child whose emotional responses to the stresses of his life are disrupting to his growth and his relationships with his environment.

The report from this group falls naturally into two parts, one having to with special education provisions in the schools, and the second

having to do with rehabilitation.

Turning first, then, to the area of special education, it was the experience of all of us that emotionally disturbed children present a great problem to themselves, their teachers, their classmates, and society as a whole. Moreover, it is clear that these children can and should be identified early, before their personal lives are deeply affected.

We feel that the present status of know-how in the education of emotionally disturbed children is such that much can be done immediately if shortages of personnel can be met. Meanwhile, we should encourage pilot projects to explore intensively the most promising new approaches now emerging, promote a survey of the scope of the problem in terms of numbers of children nationwide who are in varying degrees disturbed and in need of help, and support basic research in child development and other relevant areas of behavioral science.

To accomplish these goals, we propose the following "package" of

four recommendations:

(1) To bring immediate help to those working with emotionally

disturbed children:

(a) Make allocations through State agencies of Federal funds perhaps to be matched as under title V of the National Defense Education Act of 1958—for support of the services of school psychiatrists, school psychologists, school social workers, guidance counselors, and remedial teachers. These allocations should be usable to provide facilities, equipment, materials, and clerical assistance, as well as for salaries of professional personnel.

(b) Make grants to individuals and training institutions to provide training opportunities to help decrease the shortage of quali-

fied—

school psychiatrists;

school psychologists; (3) school social workers;

(4) guidance counselors, particularly at the elementary school

(5) remedial specialists.

(c) Make grants to individuals and institutions to furnish background training to teachers and school administrators, who must continue to be the first line of defense against developing emotional difficulties. This should include not only direct grants for instruction in principles and practices of good mental health, but grants to train "professors of mental health in education" to provide this instruction.

(2) To encourage pilot studies of new approaches:

(a) Grants to support citywide and/or countywide demonstrations of new procedures on a scale sufficient to show that can be done when these procedures are applied intensively. For example, a combination of day care centers and residential treatment in addition to special teachers in school and social work with whole families.

(b) Grants to support smaller-scale efforts to study and evaluate what specific new practices can mean if added to typical school arrangements.

(3) To determine the scope of need nationally in order to give better direction to the direct applications already recommended:

(a) Grants to a central agency, to work through States, to determine the numbers and proportions of children at each age level and type of community who need various types of help, such as—

(1) help by teachers;

(2) help within the school setting guided by professional specialists:

(3) day care at special centers;

(4) short-term residential treatment for observation and diagnosis;

(5) long-term residential treatment for reeducation.

(4) To provide for development of new techniques and understanding:

(a) Grants in support of child-development studies.

(b) Grants in support of studies of physiological and psychologi-

cal factors.

Rehabilitation aspects: We recognize that the emotionally disturbed, if they are to make an adequate adjustment, must be returned to the community as employable persons. Since there are such great numbers of these people currently in the population, and since the numbers are increasing rapidly with improved diagnostic treatment techniques which make it possible to return these people to the community instead of leaving them in mental institutions, the need for increased effort in the area of rehabilitation becomes even more acute.

This committee proposes recommendations in four broad areas to deal with these problems: (1) Improved facilities: (2) training of personnel; (3) program to develop and expand employer acceptance:

and (4) research.

(1) Facilities:
(a) We want to go on record as recommending extension and continuation of existing programs for establishment of evaluation and reeducation programs such as—

(1) Workshops for evaluation, job orientation, and work

adjustment;

(2) Training centers in key population and/or geographic areas where psychotherapy, domiciliary care, and vocational guidance is provided;

(3) Halfway houses to assist hospitalized or other emotionally disturbed people who need such a service to bridge the gap between sickness and total adjustment to community living;

(4) Intermediate facilities between hospital and local commu-

nities to which these disturbed people can return.

(2) Training of personnel:

(a) Outright Federal grants to States so as to provide training

for persons to work with the emotionally disturbed—

(1) To provide upgrading of skills of vocational rehabilitation counselors who are currently employed in vocational rehabilitation programs through graduate training. We suggest something like three-quarters base salary plus tuition and supplies. Give them leaves of absence for this training. (2) To train employment counselors.

(3) To develop group therapy, group counseling, and group work skills in ministers, school counselors, vocational rehabilitation counselors, social workers, welfare workers, psychologists, general duty nurses, public health nurses, parole and probation officers, and physicians, so that a minimum number of professionals in the community may reach a maximum number of emotionally disturbed people and augment services already given by psychiatrists.

(4) To provide orientation into the problems of the emotionally disturbed for personnel men in industry, police officers, union officials, community health and welfare organizations,

jurists, and the like.

(5) To provide upgrading of skills of personnel working in correctional schools so as to improve their skills in working with the disturbed inmates.

(3) Program to develop and expand employer acceptance:

(a) Give industry encouragement, through tax exemption or other financial incentive, to develop jobs for emotionally disturbed in industry. This might include development of job orientation and adjustment programs for emotionally disturbed new employees, clinical personnel to give supportive help to new employees during early employment adjustment period, et cetera.

(4) Research: Give grants to promote—

(a) Research into the rehabilitative counseling process to ascer-

tain what is good practice;

(b) Research to help develop new methods for rehabilitation

of the emotionally disturbed;

(c) Evaluation of jobs to determine the emotional stresses involved and personality characteristics essential for good job per-

formance in various types of employment.

In no instance have we attempted to specify the costs involved in carrying out these programs. It is felt that such estimates can be made more adequately and realistically by a central body that has before it the recommendations emanating from the six regional conferences.

WORKSHOP REPORT ON THE MENTALLY ILL AND EMOTIONALLY DISTURBED

The section on Mental Illness and Emotional Disturbance was composed of the cochairmen, representing rehabilitation and special education, twenty (20) delegates of varying professional orientation and background (including psychiatry, psychology, rehabilitation, social work and education), and two (2) observers.

It was immediately decided that the group would concern itself with the problem of mental illness and emotional disturbance as it affected the whole age range from childhood through adulthood. However, for practical purposes, it was decided that we should divide our discussion into two parts—special education and rehabilitation—and discuss each separately so that the entire group could focus its attention without distraction on the particular problems and unmet needs of each of these two groups. This procedure worked well.

The problem of the definition of mental illness and emotional disturbance came up early in the discussion. It was decided that the group would be planning programs for "any person whose emotional responses to the stresses of his life are disruptive to his growth and his relationship to his environment." Thus, the group would concern itself with all mentally ill and emotionally disturbed persons whether hospitalized or not, whether children or adults.

Since it was decided to explore the needs in special education first, the discussions on Monday, January 25, 1960, were focused on this particular area of interest and need. The following seven (7) points summarize this particular discussion:

1. Teachers have become more alert to emotional problems in children but they very much need the help of guidance people, school social workers, and school psychologists to assist them in finding solutions for the children they

have identified.

2. While mental health clinics are available in larger communities, they are not sufficient to meet demands for service. There is an urgent need of finding ways of serving children in smaller communities and rural areas, either by bringing the children to the centers or by taking the services to the children, possibly through traveling, diagnostic, and treatment teams.

3. Classroom teachers need more instruction and better supervision in supportive and understanding relationships with disturbed children in the regular

classroom.

4. College professors particularly need to be alerted to their responsibility

for identifying students in need of mental health services.

5. One of the most critical areas of personnel shortage is that of remedial education. The problems of emotionally disturbed children are reflected in an exacerbated by deficiencies in reading, spelling, arithmetic, and other skills. Personnel trained in remedial education are sorely needed.

6. Utilization of techniques that are less traditional for school programs, such as group therapy, must be employed to extend the effectiveness of mental

health specialists.

7. There should be a study of the school as a source of emotional disorders in children with a view toward revision of school programs to make them supportive of the total development of children, affective as well as intellectual.

The discussions on Tuesday, January 26, 1960, were focused on the needs of rehabilitation with an attempt being made to tie the programs of special education and rehabilitation more closely together. This closer tie seemed desirable so as to give more continuity of service to the emotionally disturbed and mentally ill. The following seven (7) points seem to summarize this particular day's discussion:

1. In order to increase the scope and effectiveness of both programs and especially to take care of the needs of the late adolescent who gets lost between the two programs, there is a need for better articulation between special education and rehabilitation. Some means of fostering greater understanding and closer cooperation between the two groups, such as joint institutes, is necessary.

2. Concern was expressed for the child who is marginal in intelligence (too high for special education and too low for regular classroom) since he is a school problem and later may become a social problem. Also the adolescent who has been treated for emotional disorder and who now is too young to take part in vocational rehabilitation. States differ in their rehabilitation practice with some doing pre-vocational counseling in the high school, but the greater number reaching the student only after he leaves school. Definition of vocational rehabilitation in terms of employability enters in here. There was some discussion of the need to take the word "vocational" out of "vocational rehabilitation" so as to permit State agencies to work at all levels of need.

3. It was pointed out that the school is not meeting the needs of the slow learner and is probably hence contributing to his maladjustment. Workshops in the community may be partly an answer along with other rehabilitation activities. A revision of the legal definition of mental disturbance is needed to make rehabilitation efforts more reaching and to obviate the current gap in continua-

tion of services.

4. Concerning rehabilitation of mental patients, after discharge from hospitals and treatment centers more specifically, differing kinds of approaches were brought up and described. The foster care program, the rehabilitation center, the half way house were discussed, and the need for cooperative effort on the part of the State mental health and rehabilitation facilities was emphasized. The programs should also offer their facilities to patients of private psychiatrists to be of the greatest service to the community.

5. Shortage of personnel was noted and a suggestion for redefinition of roles

as a possible solution to the shortage was made.

6. Education of the community is needed in order that former mental patients may be accepted into productive employment.

7. Although the idea was expressed that much more could be done under existing laws if tradition and custom were broken or changed, the idea of legislation for Federal support of some of the above ideas was brought up and reacted to favorably by the group, particularly for post-hospital programs and for in-service training of various professions.

From these discussions, the group reached the following conclusions and recommendations regarding needs in the area of special education and rehabilita-

tion of the mentally ill and emotionally disturbed:

SPECIAL EDUCATION ASPECTS

The experience of all of us is that emotionally disturbed children present a great problem to themselves, their teachers, their classmates, and society as a Moreover, it is clear that these children can and should be identified early before their personal lives are deeply affected. We feel that the present status of know-how in the education of emotionally disturbed children is such that much can be done immediately if shortages of personnel can be met. Meanwhile, we should encourage pilot projects to explore intensively the most promising new approaches now emerging, promote a survey of the scope of the problem in terms of numbers of children nationwide who are in varying degrees disturbed and in need of help, and support basic research in child development and other relevant areas of behavioral science.

To accomplish these goals we propose the following "package" of four

recommendations.

1. To bring immediate help to those working with emotionally disturbed children

(a) Make allocations through State agencies of Federal funds (perhaps to be matched as under title V of the National Defense Education Act of 1958) for support of the services of school psychiatrists, school psychologists, school social workers, guidance counselors, and remedial teachers. These allocations should be usable to provide facilities, equipment, materials, and clerical assistance, as well as for salaries of professional personnel.

(b) Make grants to individuals and training institutions to provide training

opportunities to help decrease the shortage of qualified-

(1) School psychiatrists.

(2) School psychologists. (3) School social workers.

(4) Guidance counselors (particularly at the elementary school level).

(5) Remedial specialists.

(c) Make grants to individuals and institutions to furnish background training to teachers and school administrators, who must continue to be the first line of "defense" against developing emotional difficulties. This should include not only direct grants for instruction in principles and practices of good mental health, but grants to train "professors of mental health in education" to provide this instruction.

To encourage pilot studies of new approaches.

(a) Grants to support citywide and/or countrywide demonstrations of new procedures on a scale sufficient to show what can be done when these procedures are applied intensively. (For example, a combination of day care centers and residential treatment in addition to special teachers in school and social work with whole families.)

(b) Grants to support smaller scale efforts to study and evaluate what spe-

cific new practices can mean if added to typical school arrangements.

(See appendix "A" for a description of one possible approach to problem.)

3. To determine the scope of need nationally in order to give better direction to the direct applications already recommended.

(a) Grants to a central agency, to work through States, to determine the numbers and proportions of children at each age level and type of community who need various types of help, such as-

(1) Help by teachers.

(2) Help within the school settting guided by professional specialists.

(3) Day care at special centers.

(4) Short-term residential treatment for observation and diagnosis.

(5) Long-term residential treatment for reeducation.

 To provide for development of new techniques and understanding. (a) Grants in support of child development studies.

(b) Grants in support of studies of physiological and psychological factors.

REHABILITATION ASPECTS

We recognize that the emotionally disturbed, if they are to make an adequate adjustment in society, must be returned to the community as employable persons. Since there are such great numbers of these people currently in the population and since the numbers are increasing rapidly with improved diagnostic treatment techniques which make it possible to return these people to the community instead of leaving them in mental institutions, the need for increased effort in the area of rehabilitation becomes even more acute.

This committee proposes recommendations in four broad areas to deal with these problems: (1) improved facilities, (2) training of personnel, (3) program

to develop and expand employer acceptance, and (4) research.

Facilities

(a) We want to go on records as recommending extension and continuation of existing programs for establishment of evaluation and reeducation programs such as— $\,$

(1) Workshops for evaluation, job orientation, and work adjustment

training.
 (a) These facilities would be designed as an interim experience between hospital or clinic and a return to remunerative employment.

(2) Training centers in key population and/or geographic areas where psychotherapy, domiciliary care, vocational guidance and actual vocational

training is provided.

(a) These facilities would be designed to provide treatment and training at the same time. This program would approximate the services now available in some physical medicine rehabilitation centers.

(3) Halfway Houses to assist hospitalized or other emotionally disturbed people who need such a service to bridge the gap between sickness and total

adjustment to community living.

(a) We would suggest that this concept be broadened so as to provide more vocational orientation and not just social adjustment counseling.

(4) Intermediate facilities between hospital and local communities to which these disturbed people can return. (Such as foster homes or other facilities that later research may demonstrate as being desirable.)

2. Training of personnel

It is recognized that personnel shortages in the area of mental health may never be overcome. Therefore, it would seem desirable to improve and increase the skills of other professions so that they might contribute to this area of need. This might be done through—

(a) Outright Federal grants to States so as to provide training for per-

sons to work with the emotionally disturbed.

(1) To provide upgrading of skills of Vocational Rehabilitation Counselors who are currently employed in vocational rehabilitation programs through additional graduate and internship training programs. (We suggest something like ¾ base salary plus tuition and supplies. Give them leaves of absence from their work so that they may take advantage of this training.)

(2) To train Employment Counselors, perhaps through some approach similar to that used for vocational rehabilitation counselors so as to in-

crease their skill in placing the emotionally disturbed.

(3) To develop group therapy, group counseling and group work skills in ministers, school counselors, vocational rehabilitation counselors, soccial workers, welfare workers, psychologists, general duty nurses, public health nurses, parole and probation officers, and physicians, so that a minimum number of professionals in the community may reach a maximum number of emotionally disturbed people and augment services already given by psychiatrists.

(4) To provide orientation into the problems of the emotionally disturbed for personnel men in industry, police officers, union officials, community health and welfare organizations, jurists and the like. (5) To provide upgrading of skills of personnel working in correctional schools so as to improve their skills in working with the disturbed immates.

3. Program to develop and expand employer acceptance

(a) Give industry encouragement, through tax exemption or other financial incentive, to develop jobs in industry for persons who have a history of emotionally disturbance. This might include development of job orientation and adjustment programs for new employees who have a history of mental illness, clinical personnel to give supportive help to these new employees during early employment adjustment period, etc.

4. Research

Give grants to promote-

(a) Research into the rehabilitative counseling process to ascertain what IS good practice.

(b) Research to help develop new methods for the successful rehabilita-

tion of the emotionally disturbed.

(e) Evaluation of jobs to determine the emotional stresses involved and personality characteristics essential for good job performance in various

types of employment.

In no instance have we attempted to specify the costs involved in carrying out these programs. It is felt that such estimates can be made more adequately and realistically by a central body that has before it the recommendations emanating from the six regional conferences.

APPENDIX A

Programs for the Reeducation of Disturbed Children

There is perhaps no segment of the mental health effort where facilities are more inadequate than in the care of the seriously disturbed child. There are a number of States in this region (as in other regions) where there is not a single bed for the residential care of the disturbed child. Children needing help are often put in an institution for the mentally deficient, mixed with psychotic adults, or put in a penal facility.

Society will not and should not long tolerate this situation. Yet there is no prospect of a solution within current conceptions of how facilities for disturbed children should be staffed. Manpower studies (also: Mental Health Manpower Trends) indicate that we are not going to have enough psychiatrists, psychologists, social workers, and nurses to man needed facilities in traditional patterns. We can solve the problem only by developing new conceptions.

In working with disturbed children it is possible that effectiveness depends more on the adult's personal attributes than on the extent of his training. It is believed that there are adults who are "naturals" in working with children and that these adults can be identified by careful selection. It is thus proposed that the manpower impasse be surmounted by developing around such people various

programs for the care of disturbed children.

Specifically, it is proposed that we develop a matrix of services for disturbed children that will be staffed by carefully selected teachers who are given a brief period of initial special training followed by an in-service training program and who are then backed up in their daily work by consultant help from psychiatrists, social workers, nurses, pediatricians, psychologists, and other top

level mental health personnel.

Two types of teachers would be needed: special educators for classroom work with the child and counselors who would serve as surrogate parents in residential facilities. In all facilities, school would keep. The school experience would be designed for remediation of learning deficiencies often seen in emotionally disturbed children, as well as for therapeutic benefit. In fact, it is anticipated that formal psychotherapy would be rarely used. Instead, every interaction of the adult with the child would be viewed as an opportunity for emotional reeducation.

In many ways, the success of the program will depend on the ability of top level and expensive mental health specialists to reconceptionalize their role in mental health programs. By working through other less extensively trained

people and thus making themselves more effective, the specialist can multiply his

influence and thus justify his cost.

The teachers and counselors who are selected and trained for work with emotionally disturbed children would staff a wide range of services including special classes in public schools, day care programs, residential diagnostic centers (with psychiatrists, psychologists, and other specialists doing the diagnostic work), and longer term residential centers for the reeducation of disturbed children.

Mr. Elliott. We thank you very much for your report.

Mr. Geer. The cochairmen of the neuromuscular and orthopedic groups could not be present. They were Charles S. Eskridge, director, division of special education, Texas Education Agency, in Austin; and Mr. Charles H. Warren, State director of the division of vocational rehabilitation, the department of public instruction. Raleigh, N.C.

Representing that group will be Dr. Perry Botwin, who is associate professor of special education at Texas Women's University in Den-

ton, Tex.

STATEMENT OF DR. PERRY BOTWIN, ASSOCIATE PROFESSOR, SPECIAL EDUCATION, TEXAS WOMEN'S UNIVERSITY, DENTON, TEX.

Dr. Botwin. Mr. Chairman, distinguished members of the subcommittee, our concern is with those children and adults who, because of loss and/or defects of bone, muscle, joint or nerve, are unable to function properly for the purpose of education, work, and other general demands of living.

In a group broadly representative of the very professional and program interests in the related fields of special education and rehabilitation, there was emphatic agreement on the fact that in carrying out our responsibilities to these disabled persons, it is a case of too little.

too late.

Quantitatively, we are serving only a small fraction of those who could profit materially by such services. Qualitatively, only the fortunate few get the broad scope of services that would help them achieve their highest potential.

In the matter of timing, all too few children or adults receive the educational and other rehabilitative services at this point of optimum readiness. Then the preventive and developmental values of such

services as are rendered are largely discounted by this delay.

Most urgent needs: Our group felt that special education and rehabilitation should have parallel development. They are ocmplementary services, each thriving best when supported by the strengths of the other two.

In our statement of most urgent needs, we recognize the mutuality of interests: namely, appropriate service to disabled children and

adults.

With some sense of priority, the following needs are considered to be most urgent: First, program resources. The greatest single limiting factor in expanding services or in improving the effectiveness of present efforts is in the unavailability of professional personnel.

There is no professional field in which the supply even remotely approaches this level of need. Special education teachers, physical therapists, occupational therapists, nurses, physicians, rehabilitation

counselors, social workers, and psychologists must be recruited and given special training in large numbers if we are to approach this

problem realistically.

Our Government, Federal, State, and local, must recognize this need and with imagination and a sense of urgency, create funds and resources for professional training of the needed specialists in the form of training grants, traineeships, and other forms of subsidy.

Concerning special facilities: While many of our moderately disabled can be educated and rehabilitated in facilities designed principally for the normal child, our experience is clear that those with serious, complex problems must have special facilities for diagnosis

and treatment.

Special provision for the crippled child in the regular school, special classrooms or even special resident and day centers are indicated, as are rehabilitation centers, diagnostic facilities, and sheltered work-

shops for older youth and adults.

Insofar as possible, these facilities should be community based, but the need for regional provisions for special cases is well established. Such regional facilities would be especially appropriate to those who live in remote, rural areas. In this area, the Federal and State Governments should provide major assistance to the localities, not only in advice on standards and design, but with funds for construction and program establishment as well.

Funds for financing rehabilitation and education treatment are sorely needed. Agencies providing these services must adopt standards which virtually eliminate a long-term case in their need to reach a defensible number of persons. The economics of this situation clearly indicate that long-term training and rehabilitation are more

in the public interest than is permanent long-term care.

Concerning program administration, even at our present level of limited service, we lose much of our effectiveness through lack of proper coordination and articulation of services. The multiplicity of public and private service agencies serving the disabled serves to magnify this problem.

Service program administrators of these Federal agencies should have an increased concern about the timing and continuance of services to the individual and to the prevention of wasteful duplication,

overlapping, and competition.

Another factor, improved case finding, identification and statistics would do much to facilitate the realization of the above objectives. Administrators must make better provisions for these functions. The establishment of workable administrative mechanisms for joint planning and for liaison between the various services at Federal, State, and local levels remains a challenge to administration.

Concerning legislation to broaden program coverage, independent living rehabilitation legislation is strongly endorsed in principle with the present State-Federal rehabilitation program structure being the

recommended avenue of administration.

Lowering the age limit in rehabilitation, to permit working seriously with lower teenage children in collaboration with public school personnel, and in special education and crippled children services, works to promote appropriate services to pre-school-age children.

There should be the revision of present allotment provisions concerning Federal grants-in-aid to States in vocational rehabilitation to permit allotment to other States, the unused portion of a State's allotment and to remove the provisions of the present act that exerts

negative effect on a State's effort toward program expansion.

Concerning research, it is believed that much improvement in the administration of present funds for research could be realized to prevent wasteful duplication and the support of weak, ill-conceived projects. A national clearinghouse of research activities and grants should be established to cover all Government-sponsored research in relating services to the disabled.

Also, medical research in the field of rehabilitation should be administered by the National Institutes of Health to insure better

medical supervision and management.

There should be a greater expenditure for research and service demonstrations to facilitate the developments of new knowledge, new techniques, and new patterns for rendering service within the com-

nunity.

In closing, I would like to state the committee expressed its appreciation for being asked to appear, and to make one statement: The time for planning and thinking has arrived. They feel strongly the time for action is now.

WORKSHOP REPORT ON ORTHOPEDIC AND NEURO-MUSCULAR DISABILITIES

Charles H. Warren, Cochairman Charles E. Eskridge, Cochairman Corbett Reedy, Recorder Perry Botwin, Workship Reporter to the Committee

Our concern is with those children and adults who because of loss and/or defects of bone, muscle, joint or nerve, are unable to function properly for the

purpose of education, work and other general demands of living.

In a group broadly representative of the varied professional and program interests in the related fields of special education and rehabilitation, there was emphatic agreement on the fact that in carrying out our responsibilities to these disabled persons it's a case of "too little, too late." Quantitatively, we are serving only a small fraction of those who could profit materially by such services. Qualitatively, only the fortunate few get the broad scope of services that would help them achieve their highest potential. In the matter of timing, all too few children or adults receive the educational and other rehabilitation services at their point of optimum readiness. Then the preventive and developmental values of such services as are rendered are largely discounted by this delay.

Most urgent needs.—Our group feels that special education and rehabilitation should have parallel development. They are complimentary services, each thriving best when supported by the strengths of the other. In our statement of most urgent needs, we recognize the "Commonness" or mutuality of interest, namely—

appropriate service to disabled children and adults.

With some sense of priority the following needs are considered to be most urgent:

A. Program resources

(1) The greatest single limiting factor in expanding services or in improving the effectiveness of present efforts is the unavailability of professional personnel. There is no professional field in which the supply even remotely approaches this level of need. Special education teachers, physical therapists and occupational therapists, nurses, physicians, rehabilitation counselors, social workers, psychologists, prosthetists, must be recruited and given special training in large numbers if we are to approach this problem realistically. Our government, Federal, State, and local, must recognize this need and with magination and a sense of urgency create funds and resources for professional training of the needed specialists in the form of training grants, traineeships, and other forms of subsidy.

(2) Special Facilities—While many of our moderately disabled can be educated and rehabilitated in facilities designed principally for the normal child,

our experience is clear that those with serious complex problems must have special facilities for diagnosis and treatment. Special provision for the crippled child in the regular school, special classrooms, or even special resident and day centers are indicated, as are rehabilitation centers, diagnostic facilities, and sheltered workshops for older youths and adults. Insofar as possible, these facilities should be community based, but the need for regional provisions for special cases is well established. Such regional facilities would be especially appropriate to those who live in remote, rural areas. In this area, the Federal and State governments should provide major assistance to the localities, not only in advice on standards and design, but with funds for construction and program establishment as well.

(3) Funds for financing long term rehabilitation and educational treatment are sorely needed. Agencies now providing these services must adopt standards which virtually eliminate the long term case in their need to reach a defensible number of persons. The economics of the situation clearly indicate that long term training and rehabilitation are more in the public interest than is permanent long term care.

B. Program administration

(1) Even at our present level of limited service, we lose much of our effectiveness through lack of proper coordination and articulation of services. The multiplicity of public and private service agencies serving the disabled serves to magnify this problem. Service program administrators of these Federal agencies should have increased concern about the timing and continuance of services to the individual and to the prevention of wasteful duplication, overlappings, and competition.

(2) Improved case finding, identification, and statistics would do much to facilitate the realization of the above objectives. Administrators must make

better provisions for these functions.

(3) Establishment of workable administrative mechanisms for joint planning and for llaison between the various services at Federal, State, and local levels remain a challenge to administration.

C. Legislation

(1) To broaden program coverage.

(a) Independent living rehabilitation legislation is strongly endorsed in principle, with the present State-Federal rehabilitation program structure being the recommended avenue of administration.

(2) Lower the age limit-

(a) In rehabilitation to permit working seriously with lower teenage children in collaboration with public school personnel;

(b) In special education and crippled children's services, work to promote

appropriate services to pre-school-age children.

(3) Revision of present allotment provisions governing Federal grants-in-aid to States in vocational rehabilitation to:
 (a) Permit allotment to other States the unused portion of a State's allot-

ment.
(b) To remove the provisions of the present act that exert negative effects

(b) To remove the provisions of the present act that exert negative effects on a State's effort toward program expansion.

D. Research

(1) It is believed that much improvement in the administration of present funds for research could be realized to prevent wasteful duplication and the support of weak, ill-conceived projects. A national clearinghouse of research activities and grants should be established to cover all Government sponsored research in relation to services to the disabled.

(2) Medical research in the field of rehabilitation should be administered by

NIH to insure better medical supervision and management.

(3) A greater expenditure for research and service demonstrations to facilitate the development of new knowledge, new techniques, and new patterns for rendering services within the community.

WORKSHOP PARTICIPANTS

Dr. John W. Kemble, Department of Neurology, Medical College of Georgia, Augusta, Ga.

Mrs. Harold M. Seymour, administrator, Cerebral Palsy School Clinic of Atlanta, Atlanta, Ga.

Mrs. Thelma Godfrey, supervisor, exceptional child education, Jacksonville.

Dr. Florence V. Essery, Department of Special Education, University of Ten-

nessee, College of Education, Knoxville, Tenn.

Miss Helen Carr, supervisor, Crippled Children's Service, Atlanta, Ga.

Dr. Edward M. Krusen, director, Department of Physical Medicine and Rehabilitation, Baylor University Medical Center, Dallas, Tex. Mr. F. E. McGahan, director of special education, Galena Park Public Schools.

Galena Park, Tex.

Dr. Perry Botwin, associate professor of special education, Texas Women's University, Denton, Tex.

Mrs. Dorothy B. Poythres, director, program for exceptional children, Macon.

Mr. Shelley V. Smith, executive director, West Texas Rehabilitation Center, Abilene, Tex.

Dr. William G. Wolfe, professor, educational psychology; director, program of special education, University of Texas, Austin, Tex.

Mr. Don Partridge, director of special education, Corpus Christi Public Schools,

Corpus Christi, Tex. Dr. Floyd Bliven, associate professor of orthopedics, Medical College of Georgia, Augusta, Ga.

Mr. L. J. Waller, supervisor of physical restoration, division of vocational

rehabilitation, Birmingham, Ala.

Dr. Stanley Graham, neurosurgeon, consultant, division of vocational rehabilitation, Birmingham, Ala.

Mr. Corbett Reedy, Regional Representative, Region III, Office of Vocational

Rehabilitation, Charlottesville, Va. Miss Betty Nichols, program director, Georgia Society for Crippled Children

and Adults, Atlanta, Ga.

Dr. Joseph H. Patterson, associate professor of pediatrics, Emory University, Atlanta, Ga.

Mr. Еглотт. Thank you very much, Dr. Botwin.

Mr. Geer. Our last section of the day will be the section on gifted children. Before I introduce the report of that section, I would like to say again that the people in the workshop appreciated the opportunity to get together, and I am sure that if they were all here and could see you folks laboring so patiently and diligently, and listening to so much for so long, that they would certainly appreciate their representatives.

Our last speaker will be Dr. Virgil Ward, who was chairman of the section on the gifted, carrying the load by himself, and he now

will report to us on the findings of that group.

Dr. Ward is from the University of Virginia, at Charlottesville, and has been a consultant on the boards of various projects concerning gifted children and will soon begin to direct a yearlong project pertaining to the State department of education personnel concerning the education of the gifted.

STATEMENT OF DR. VIRGIL WARD, COLLEGE OF EDUCATION, UNIVERSITY OF VIRGINIA

Dr. Ward. Mr. Chairman, Mrs. Green, gentlemen of the subcommittee, I, too, would like to express the appreciation of the workshop group on the gifted for this opportunity to present some of our deliberations to you this afternoon.

It has been remarked that the gifted child who is generally conceded to be the most educable child is quite often found to be the most retarded child in terms of grade placement in the American school. I am sure that the committee would accept this opening remark of mine in the good spirit that it is intended, if I suggest that we find ourselves here this afternoon at the tail end of these deliberations in the historic position that the gifted child has been in terms of consideration by American society.

We are quite happy, indeed, I might say, to find a changing and a changed climate of opinion in this regard, which will make your work in our behalf much easier, and it certainly makes our concerns more

readily worked with.

I should like to say just a word for the group concerning the logic of special education for the gifted. It is not that you subcommittee members would at all need to have this logic presented, but that many of the people with whom you must discuss the problem will need a

presentation of the logic.

We consider it to be exactly the same as it is for children who are mentally retarded, namely, that at some point on either end of the scale of intelligence there arrives a position in which the normal grade school experience for children must be adapted to meet the differential abilities represented by children who fall at the extremes of the scale. This is a well understood concept and there has been much admirable and worthwhile activity in the direction of meeting the special needs of children who fall at the lower end of the intelligence continuum and we feel that it is for exactly the same logic that we need a study, a differentiation of educational experience, to parallel the superior capacities, abilities, and particular needs of the child who falls at the upper extreme of the intelligence continuum.

An analogy which I found useful in this connection comes from athletics, suggesting that the good runner will perhaps win the race or track meet even though the track upon which he is running is not an especially well prepared one. But I think we would all concede that he is scarcely likely to set a record or to do his best running on a

poor track.

We suggest that it is possible for us to devise a better track upon which the gifted child may run, by way of an educational curriculum. We would suggest also that in this connection of arriving at differential experiences for differentially endowed children, that this concept, far from being opposed to the democratic ideal, is really quite

necessary to it.

We feel that we are in a particular position in the field of special education. We are most happy, of course, to be included in this grouping. But on the other hand, by virtue of this historical position which we have occupied, in which the attention of the Nation has centered first upon the handicapped child, we find ourselves in a position not simply of being shorthanded in terms of personnel, or shorthanded in terms of a developed science, but almost at the zero position in terms of personnel and concepts that are peculiarly and particularly adapted to the needs of the gifted child.

We have enough evidence to indicate quite clearly that there is a need here, but several of our particular recommendations will be contingent upon the fact that we face honestly, as professionals in this area, that we do not have a developed body of science or a developed body of technology or practices which support the clearly

recognized need for special education of the gifted child.

I would like to offer for your consideration four major areas of need, isolated by the workshop group within the past 2 days, and

these will be presented only in a very brief résumé by virtue of the

fact that the full report will follow.

We feel first that there is a vast need for pulling together such bits of science, research, knowledge, reliable opinion, as have accumulated through the years in this particular field. We are more diversely spread, we are more heterogeneous in our knowledge in this area unquestionably, from the very definition of what a gifted child is, than are some of the other areas with a well established history and a great body of practices specifically in those given areas.

So we would suggest first that a very admirable expenditure of funds supplied from the Federal level, most realistically, would be a series of conferences, similar to the Utah conferences on creativity which were established by the National Science Foundation in the years 1955, 1957, and 1959, to bring together a relatively small group of highly qualified persons for a rather lengthy period, running more than 3 or 4 days, into a couple of weeks or more, to blend their minds, their knowledge, together to clarify and codify the real positions that exist in terms of present knowledge.

We feel that only through such a medium can we establish working definitions and conceptions which will furnish guidelines for the continuing research, the search for knowledge that will go on in this area. We face honestly the fact that we are unable now to tell how great are our needs in many specifics because those specifics have not

yet been isolated and identified at the conceptual level.

Secondly, we suggest that there is a near vacuum at the level of leadership training. Again this, we think, is a tribute to the default of long experience with supportive community attitudes and financial undergirding. We have few persons, not enough to put in terms of percentages, but few persons on an absolute scale in State departments of education throughout the Nation who are qualified to speak specifically of the particular needs of the gifted child, even at the college level, the college and university level, where you will find quite well trained people to deal with the various levels of handicap, various areas of special need of other categories of exceptional children.

We find a small handful of people who are trained to speak reliably and authoritatively with respect to the particular needs of gifted children. Of course, it would go without saying that a near vacuum at those two levels would, of course, leave us with a very near vacuum, again, of classroom teachers who are specifically trained to deal adequately with such children and also vocational rehabilitation

personnel.

I think we might take a reading from the fact that we were unable to locate readily a single vocational rehabilitation person to sit with our group in these deliberations to indicate to you the void of concrete, particular practices in the area of vocational rehabilitation with re-

spect to the gifted child.

Third, we suggest that predicated upon the idea, the faith, that there is a better educational curriculum than we have yet devised for the gifted child, we honestly admit that we do not know exactly the form, the content, the organization, of such curriculum, and we suggest this as a third major area of need.

We are concerned that legislation existent presently provides for a rather radical reconception and reformulation of certain subject matter areas, specifically natural sciences, foreign languages, but that there are other subject matter areas equally as vital to the citizenshipeducation of the gifted child, to the liberal education of the citizen, which are equally as important in terms of their being reconceptualized for the advanced intellectual perceptions of the gifted child.

Fourthly and finally, in terms of the immediate needs that we were able to carve out is our old friend that I have scarcely heard not mentioned by any group this afternoon—research. Out of some 13 details that we isolated here for urgent need for research, I should like to suggest only I, leaving the others for your attention in the report.

We have a very fine, one of the finest and most exemplary studies in American psychology, accomplished by Louis Turmond, in the interest of the gifted child, his genetic studies of genius, in which he followed some 1,000 children from the State of California for a period of 35 years, beginning at age 10, and the latest report concerned them at

approximately age 45.

No studies since the time that Turmond has started his reports have served to refute any of his major findings. Therefore, we have a backlog of quite reliable scientific information concerning the nature, the learning characteristics and processes of these children, and we suggest to you as a group that we need a similarly well conceived, imaginative body of research on the curriculum content and organization conceived over a longitudinal period that parallels these fine abilities of the children.

Mr. Chairman, I brought my watch with me, but I am afraid I failed to look at it. I have concluding remarks. Could I have one moment on those?

Mr. Elliott. Yes.

Dr. Ward. As we began to speak to you on the logic of special education for the gifted, I should like to close with a suggestion toward the promise, the social gains that stand to result from special education for the gifted youth.

Dr. Thorndike, some years ago, raised a most imaginative and provocative question pertaining to this point. He asked what could the world afford to pay for the cure to cancer some 10 years

earlier than it will otherwise come to be?

We would suggest to you not at all with a slight degree of derogation of the admirable efforts that have been put into the effort of the mentally retarded child, we suggest to you and urge you to apply just this logic: that if we consider that the special education of the mentally retarded will bring such a child up to a level where he may be self-subsistent and make a minimal contribution to society beyond self-subsistence, that on the other hand, special, improved, compacted, excellent education for the gifted child stands fair to yield to society a return more nearly in the character of 100 to 1, 1,000 to 1, if indeed not 10,000 to 1 upon the investment.

This is the bright promise of special education for the gifted. By way of figures, we suggest that even if you start with the top 1 percent of the intelligence scale and take the figure of 37 million school children in America, that would leave 370,000 children who are capable of taking an infinitely more difficult and improved education

than they are presently engaging in.

I thank you and the committee for the privilege of being heard.

Mr. Elliott. Thank you, Dr. Ward. Where are you from, Doctor?

Dr. WARD. The University of Virginia.

Mr. Elliott. Thank you very much. You have given us a stimulating challenge.

WORKSHOP REPORT ON THE GIFTED

Chairman: Dr. Virgil S. Ward, University of Virginia

Recorder: Mrs. Carolyn Fleming, DeKalb County (Georgia) Public Schools

I. Purpose of the Study.
II. Rationale of Special Education for the Gifted.
III. Nature of the Need.
A. To Establish a "Science" of Special Education for the Gifted.

A. To Establish a "Science" of Special Education for the Gifted.
B. To Train Personnel in All Categories.
C. To Advance Knowledge of the Nature of Giftedness.
D. To Develop Multiple Curricula.
E. To Discover Appropriate Patterns of Educational Organization.
IV. Implementation of Aid Through Federal Resources.

I. PURPOSE OF THE STUDY

A. To determine adequacy of existing Federal legislation in meeting needs. B. To identify needs not being met.

C. To recommend useful additional Federal support.

II, RATIONALE OF SPECIAL EDUCATION FOR THE GIFTED

The logic of special education for the gifted.—The members of this section consider that special educational needs exist for gifted children by virtue of exactly the same reason that they are recognized for other types of exceptionality. Differential natural endowments and developed characteristics, in the case of the gifted these being fortunate in nature, are such that educational processes which satisfactorily develop persons within the usual range of behavioral potential, fail exactly and fully to bring to fruition exceptional learning capacities. Educational experiences which parallel and satisfy those deviant qualities through which persons of superior intelligence and aptitude are identified, may be thought of as unique to the gifted. It is the quest of special education to develop both reliable means for detecting giftedness of all kinds, and for improving educational content and methods for the optimum development of persons so endowed.

The justification of special education for the gifted.—The efforts to meet satisfactorily the differential needs of bright and talented youth are justifiable on two principal counts. First, the democratic social ideology rests upon opportunity for the individual, whatever his nature and needs, to realize himself as a The fullest development of persons of extraordinary endowment demands that special endeavors be made to seek out, to satisfy, the personal needs

dictated by the nature of their individual capacities.

Second, society gains from the effort. If education affects behavior at all, serving to develop the individual's potential for performing productive services, the search for improved techniques through which to develop in a superior manner the superior endowments of the gifted, promises magnified benefits to society in return for the investment. Even a slight improvement in the ability and productivity of a person of great capacity for thought, or learning, or creativity, yields disproportionately more than does equivalent improvement in the education or training of persons of moderate endowment. Gifted children typically become productive adults, advancing human culture on all fronts, including the sciences, the progressions, the arts, and social and governmental services. To discover such persons early in the school years, to improve upon their school experience, and to compact their formal education into a shorter number of years, therefore, promises all the benefits to mankind represented collectively by continuing advances in the arts and technologies that comprise human culture. E. L. Thorndike's early question: What could the world afford to pay for the cure for cancer ten years earlier than it will otherwise come to be? is a realistic charge to responsible officials and educators on the contemporary scene.

Differences in history and background of this effort.—The American nation has arrived late at a clear realization of the significance of special education for persons of superior ability. In contrast to the field of mental retardation, there is a paucity of organized lay and professional promotion of the cause of the gifted, there is an incomparably smaller body of research and study devoted to learning activities and the development of educational materials, and a near dearth of tested administrative practices in schools which modify regular procedures better to accommodate the gifted. While there have been single scholars here and there, notably Lewis M. Terman and Leta S. Hollingworth, who have envisioned clearly the significance of special education for the gifted, public opinion as a whole has not until the present decade supported the various fronts upon which advancement of this cause must now proceed. It is from this fact of differences in the history of the movement of education for the gifted in America which stems several of the recommendations that occur subsequently in this report. It is a happy turn of affairs, indeed, that the public mind today has moved toward demanding the very special attention for the gifted youngster, which would have been considered unwise and undemocratic but a scant number of years ago.

Preamble to the recommendations.—The study group based its deliberations

upon the following articles of faith:

1. That there is a body of definable characteristics which distinguish individuals such that they can be designated by some term like "gifted," and that these differentiating characteristics demand differential education. (For purposes of these deliberations an arbitrary delineation setting off the top three percent of persons on scales of either general intelligence or specific aptitudes was accepted. It was felt that the more extremely deviant the group, the more justifiable their inclusion in the field of special education.)

2. That pointed and sustained effort, supported by facilities and resources, can discover patterns of educational organization, curricular content, and teaching methods which will serve better to develop the gifted than do the curricula.

which serve the generality of children and youth.

3. That a search for successful education for the gifted no less intense and comprehensive than that for other types of exceptional children is not opposed to the democratic concept, but rather essential to it.

III, NATURE OF THE NEED

A. To establish a "science" of special education for the gifted.—Such knowledge as has been accumulated concerning the nature of giftedness and its proper development through education has been accomplished so diversely, and under such varying frames of reference that a need exists to pull together what exists into an orderly collection of facts and principles that may be said to comprise a "science." Concepts should be clarified, definitions distinguished and contradictions therein resolved, and miscellaneous terminology reduced to economical and functional classifications. Such concentration at the level of theory promises to yield guidelines for future research and educational practice, such that duplication may be minimized, trivia abhorred, and the repetition of unfruitful efforts avoided. Even reliable quantitative estimates of needed personnel, financial support, facilities and equipment must await such clarification of concepts and classification of existing knowledge.

Part of such a "science" would be the particularization of objectives for special education of the gifted, assuming that particular objectives do pertain. And, so the members of the group thought, the concepts of rehabilitation, largely undeveloped with respect to the gifted, needs to be imaginatively explored as a means of restoring wasted human resource in especially promising areas.

To meet these needs:

1. Conferences of selected, qualified scholars, similar to the National Science Foundation Conferences on Creativity (the Utah Conferences of 1955, 1957, and 1959), running for a sufficient length of time to permit reflection and deliberate thought.

2. Grants in support of critical reviews, analyses, and attempts at syn-

theses of thought leading toward comprehensive theory.

 Dissemination of reports of such progressive advances in theory and science by appropriate governmental agencies in manner similar to distribution of health literature, etc.

4. Systematic endeavors to establish techniques and procedures for the utilization of emerging machine processes for codifying and processing information and data for resourch analysis. Modern data processing methods and machinery permit large-scale investigations impossible, if not inconceivable, but a few years back,

B. To train personnel in all categories.—Whereas those especially concerned with other areas of exceptionality among children speak of personnel "shortages," the field of the gifted manifests a near vacuum of persons specifically prepared in related professional competencies. College and university teachers, State department of education officials, school psychologists and counselors, curriculum supervisors, special education teachers, and vocational rehabilitation personnel—in scarcely any of these categories are specific concerns for the gifted explicitly recognized in professional training and professional practice. contrast with the degree of emphasis among all such specialists on the problems of the retarded and handicapped serves but to suggest how much remains to be done for the fortunately endowed.

To meet these needs:

1. Grants for leaves of absence on the part of college and university personnel to study successful programs of education for the gifted, and theory that might lead to still more appropriate practices.

2. Institutes, long term and short term, similar to guidance institutes under the National Defense Education Act, geared to the applications char-

acteristic of each level of personnel noted above.

3. Scholarships for teachers in academic year institutes, as well as encouragement of this emphasis in undergraduate teacher training programs. Question: What would be the effects of 250 leaves of absence for college personnel, of 1 academic year institute in each state, and of 1,000 summer scholarships for teachers, yearly over a period of 5 years time, in the massive upgrading of American education to meet this critical area of

neglect?

C. To advance knowledge of nature of giftedness.—The basic characteristics of intellectually superior performance are reasonably well known. Terman's major researches have been paralleled by dozens of minor studies in which measured intelligence was the experimental factor. And the instruments for the detection of intellectual superiority even in early childhood are far and above the most reliable psychological instruments which have been devised. On the other hand, almost as incomplete as this body of facts is full, are similar facts and similar instruments for detecting specific forms of behavioral efficiency which we call aptitudes or talents. We need knowledge of the origin of such singular traits, of the manner in which they develop through childhood, and of modes of schooling which support and contribute to their optimum fulfillment.

Also similarly void is an extracting knowledge of the emotional and motivational substructures which lie imbedded within the personality of the gifted individual, and which make the difference between whether his general or specific intellective functions shall become suitably operative. What are the differential dynamics among people who are constructive, productive, and creative, as distinct from passively efficient and merely adjustive. What causes one gifted person to achieve commensurately with his ability, and another to assume no more responsibility in life, or to produce no more than persons with modest biological endowment? And what is possible by way of rehabilitation of persons whose early careers run counter to expectation, as their adult years unfold? These are questions vital to the wisest utilization of human talent as a natural

resource.

To meet these needs:

1. Generous continuing support of scientific research in the manners ac-

knowledged and referred to in section IV of this report.

D. To develop multiple curriculums.—Paralleling in importance the need to know much more fully the nature of gifted persons, is the need to know what kinds of experience—integrated at what age levels, and administered in what particular contexts-will serve most appropriately to foster and develop the priceless biological deposits of superior intelligence and aptitude. tion has been aptly raised. What would we do with a young Robert Frost if we were in fact able to identify him surely at the age of 10? As observed previously, if education in general is good for the generality of persons, then it must be possible (and special educators believe it is) to discover patterns of special education for the gifted which differ, and which improve upon the common curriculum.

In particular, there appears to be a limited concept of the range of significant knowledge enjoying support in existing legislation. If it is useful to know how persons of foreign extraction speak, is it not even more basic to know the cultures out of which their minds, their funded behavior emerges? And if it is important that research proceed in physical science, is it not even more important that there be advances in knowledge of the desires and impulses which lead man to apply technological skills and machinery to certain uses over others? The participants in this section of the workshop believe that both the humanities and the social sciences should be covered as adequately in specific legislation supporting research as are mathematics, the natural sciences, and foreign languages.

Beyond this, it appears strikingly true that the school curriculum has changed its character during the past half century in no manner at all parallel to the magnitude of change in social problems and scientific advances. Hence, there is a need to restudy school experience from imaginative and fresh perspectives, with an attempt to arrive at what Walter Lippmann has termed a necessary

"breakthrough" in educational processes.

There will be a need for increased support for the purchase and maintenance of facilities, equipment, and material, if educational techniques are to reflect properly the differences between the complicated technological and social world of yesterday and today.

To meet these needs:

I. Grants for curriculum reformulation in areas other than mathematics and natural science. As mathematicians are developing exciting new approaches toward mathematics education, so there needs to be a similar inquiry into the humanities and the social sciences. The National Science Foundation, with all of its subordinate activities, could and should be paralleled in other academic disciplines.

2. Support through State departments of education and college, and university departments for action research on various types of reformed cur-

ricula, instructional methods, etc.

3. Aid in the purchase of expensive equipment for the schools in a manner somewhat commensurate with the repeated gestures toward aid in school

building construction.

E. To discover appropriate patterns of educational organization.—The impact of education upon human development is of a whole cloth; pieces and threads, no matter how strong or how beautiful, do not comprise useful or pleasing fabrics until woven into a whole. So it is that optimally effective combinations of educational practices must be sought for, patterns of overall school organization that combine in various forms special classes, and special instructional materials and methods—and these applied at different age-grade levels, and for different periods of time—if the total and enduring effects of education in bringing to fruition the talents of exceptional persons are to be reliably known. Do we have the best entry and terminal points for schooling the bright, or would successive returns to advanced institutes for thought and research during the mature years of adulthood be profitable in conducting toward the highest development and utilization of the minds of men and women of great ability? In every level of attack upon the problem of educating the gifted, the manner is fragmentary and piecemeal: in research, in curriculum revision, and in administrative adaptations of the school program.

And very little is known beyond surface level generalities about the nature of the teaching personality which is most conducive to proper development among creative and productive young people. Do such children need "supportive" persons around them, or those who firmly expect independence? Is meticulous explanation, or inspiration and challenge the better communicative climate? Should there be differing types of teaching personalities at the primary, intermediate, and secondary levels of school? These and many other problems remain with respect to the personality of the teacher as an organic part

To meet these needs:

of the total educative influence.

1. Support for well-conceived, longitudinal experiments covering one to five decades, under institutional auspices, in pilot centers of varying designs; again, combinations of special classes, special schools, reorganized school terms, early admission and early graduation, etc. Only through longitudinal studies can the full impact of educational provisions upon the person in his total lifespan become known.

IV. IMPLEMENTATION OF AID THROUGH FEDERAL RESOURCES

The participants in the section on the gifted believe that there is much to be commended in present Federal aids to special education and rehabilitation.

Many sound features characterize the administrative machinery through which these aids are channeled, as in the regular functioning of the U.S. Office of Education, the National Defense Education Act, the National Science Foundation programs, the Cooperative Research Program, and the other forms of aid at higher or lower categorical levels. The incorporation of professional advisory councils to weigh the value of proposed projects is viewed as a desirable feature in several respects. Expressed with the strength of an article of faith was the desirability that all Federal aid should be exercised with freedom in usage at the State and local levels. It was expressed as a matter of concern, in fact, that the States had shown possibly too little vigor in taking advantage of such support as is presently available in diverse forms, and too little imagination in applying these resources to their most vital needs.

There was general recognition that waste through duplication of effort was inevitable in piecemeal legislation; at the same time, however, no particular advantages were seen to the needs of the gifted in single acts designated therefor, which could not be obtained through clearly delineated, permissive uses in omnibus bills geared to the advancement of all types of exceptionality among

children and improperly functioning adults.

On the more adverse side, it was noted by the group that no specific Federal legislation in the interest of the gifted was actually in operation, similar to those provisions well established for other areas of special education. The National Defense Education Act, intended in the majority to perform this function, was worded in such a way that general uses were allowable, and accordingly general uses have been made. Also, it was regretted that the coverage of the NDEA was such as to exclude the elementary school levels, and to place em-

phasis upon selective subject matter as noted herein.

A variety of methods of Federal support appeared appropriate to this group of professionals, many of which have been indicated in the preceding statements of need: Research grants, traineeships, top-level conferences, complete facilitation of higher education for those able to profit from it, funds for facilities and equipment, etc. The importance of varied forms of support was recognized, and of varied forms of research, such as experimental and action. By virtue of the peculiar state of incomplete development as a science which characterizes special education and rehabilitation for the gifted, especial usefulness of deliberative efforts of qualified scholars bent toward the development of comprehensive theories, and the devisement of productive experimental methodologies was emphasized.

And, finally, it was considered especially important from a long-range point of view that the most promising methods now available for data processing and the codification of knowledge for dissemination and further research, replace the near obsolescent procedures upon which science and scholarship are now dependent. This need was foreseen as becoming increasingly important.

Even in the post-War II period, 1945–60, characterized by such vital international realinements and shifts in status and power, and by near-unbelievable scientific and technological changes, there have been but slow forward movements in special education for the gifted. Scattered, unsystematic, often superficial and usually inadequate gestures have prevailed. America, even in these critical times has been hampered by a public mentality that reluctantly tolerated, and deliberately withheld sanction for special educational efforts in behalf of persons incontestably better prepared to return in social gains more than those who received the more generous support in a rightful but narrow interpretation of the democratic principle of equalitarianism. The Subcommittee on Special Education and Rehabilitation is to be commended for including in its efforts, now that the climate of opinion has changed, generous and imaginative support for investment in the top strata of human abilities.

Mr. Elliott. We have one other witness, Mr. Otto H. Nebrig, from Decatur, Ala.

STATEMENT OF OTTO H. NEBRIG, INTERESTED PARENT, DECATUR, ALA.

Mr. Nebrig. We have heard quite a few good speeches here today. I have been here all day and I haven't heard any from a parent. I am a father of a mentally retarded child. He is 6 years old. He

cannot talk yet.

The doctors tell us he will. I have carried him to Birmingham and to Nashville. We have just recently started a unit in Decatur for the mentally retarded, trying to get something done. Mrs. Beasley, with the State board, helped us get it started.

However, I am not speaking for that body. In fact, I came down here without any intention of saying anything, but just to listen.

I have three normal children, one 25, one 24, and one 12. Then I have this child who is 6. The three older children are getting their education from the public schools in the city of Decatur. I think the other child should have an equal opportunity. I do not think, in other words, any additional expense other than what the child is normally entitled to expect would be had.

I think the parents would be willing to kick in. But the main thing I am interested in is a center for the evaluation of these children so we will know what they can do, what we can expect, how much of an education they can absorb, if they are educable or whether they are trainable or what can be expected. That is one thing I

know we need.

Then if the child can be educated, it ought to be afforded some place in the public schools or some facility where it can have whatever education it can absorb, or if it is not educable, if it is trainable, then a workshop should be available where it can get the training

it can take for what it is best fitted for.

But the main thing is the center they are trying to get set up in Birmingham now, to evaluate these children so we can tell what to expect and what they can do. Of course, our boy, he is 6 years old and he is healthy, except mentally. He cannot talk. The doctors tell us he will talk, but I do not know when and they do not know when. We love him and we are proud of him. We are not ashamed of him.

Any questions of this committee I would like to answer.

Mr. Elliott. Mr. Nebrig, you brought us a very down-to-earth and practical approach to the problem and have made a contribution to our hearing. We appreciate it very much.

Mr. Nebrig. Thank you.

(The following material was submitted for the record:)

TESTIMONY OF Dr. T. MUNFORD BOYD, PROFESSOR OF LAW, UNIVERSITY OF VIRGINIA LAW SCHOOL

My name is Munford Boyd. I am a member of the board of directors of the National Federation of the Blind and professor of law at the University of Virginia. I am, of course, familiar with the activities of the National Federation of the Blind and of the 46 statewide organizations of blind men and women of which it is composed. I wish to discuss briefly two needs or problems which are important to the Southern States, but no less to the Nation as a whole.

THE NEED FOR CONSULTATION

On behalf of the organized blind, I wish to commend this committee for the extensive and highly productive consultations which it is presently conducting through the utilization of the workshop approach with the blind and other groups of our handicapped population. Not only the unprecedented range and depth of these regional conferences, but the serious concern which they reflect on the part of Congress for the views and interests of the citizen groups most directly affected, constitute a model of the democratic principle of consultation as it finds expression in the political process.

With your permission, I should like to address my brief remarks to that same principle of consultation—which has been aptly defined as "the right to be heard." I need not waste the valuable time of this committee in nunnecessary explanations, for I know of no other institution in our public life which so clearly and consistently recognizes the importance of consultation as the committee system of Congress itself, with its regularized public hearings on matters of pending legislation in which all interested citizens may give expression to their views in

full confidence that they will be respectfully heard.

Unfortunately, not all public agencies engaged in executing the laws and administering the policies laid down by Congress have displayed an equal awareness of this vital principle of government. Indeed, it is in the particular area of policy administration with which this committee is directly concerned that the procedures of consultation with affected citizen groups are perhaps

least operative and least effective.

It goes without saying that the very meaning of the principle of consultation, as embodied in both the legislative and administrative branches of government, is that individuals and groups affected by public programs have the right to be heard in the formulation and execution of those programs. Thus, it is not only our legislators who are to be regarded as representatives of the people, although their democratic election makes them preeminent in that respect. Representative government extends as well to the executive and administrative agencies responsible for the performance of the programs approved by Congress. It is especially within the field of public administration that the representative device of consultation finds its most direct and forceful application, just as it is here that problems of democratic responsibility and control are most evident.

The multiple values of consultation in the administrative process have, of course, long been recognized by the Federal Government. For a typical example, the 1941 report of the Attorney General's Committee on Administrative Procedure (77th Cong., 1st sess., Doc. No. 8) contains a detailed account of the development and function of consultative practices: "As economic and other groups in the community became organized and vocal," the report stated, "and as legislation affecting them came more and more into existence, administrators, in contact with those upon whom their authority bore, turned to them for information and their point of view. Participation by these groups in the rulemaking process ls essential in order to permit administrative agencies to inform themselves and to afford adequate safeguards to private interests." It would require more time than I have at my disposal to itemize either the number of Federal agencies which institutionalized the principle of consultation or the wide variety of methods which they have employed for this purpose. It is perhaps sufficient to observe that professional and scholarly authorities in the fields of law and public administration are unanimously agreed that there are few features of democratic government more nearly indispensable than that of active participation by interested citizen groups through systematic procedures of consulta-By way of illustration, I might cite the conclusion of one such authority, Prof. Avery Leiserson, that "it is perfectly clear that in the sense of the right to be heard, to be consulted, and to be informed in advance of the tentative basis of emerging policy declaration, group participation is a fundamental feature of democratic legislation and administration."

All this may seem to be only a demonstration of the obvious. Unfortunately, in the administration of public programs of vocational rehabilitation (including sheltered workshops) as well as those of public assistance, the principle of consultation has in the past been honored more often in the breach than in the observance. Particularly with reference to programs directly addressed to our blind population, the need for the clients to be heard and consulted has been for the most part ignored by administrators both of Federal agencies and of State agencies participating in the use of Federal funds. In fact, spokesmen for some

agencies for the blind have gone so far as to deny, not only the need and desirability of such consultation on the part of blind clients, but even their right as citizens to be consulted. Thus, a national association of agency workers for the blind has declared publicly that any legislation aimed at protecting the consultative right of blind groups "is not only unnecessary and unjustified but * * embodies a completely unsound and retrogressive concept of the responsibilities and privileges of blind persons as citizens."

In view of this and similar denials of the right of our blind people to be heard on the policies governing their welfare, it is pertinent to note that only if blind persons are regarded as less than citizens and less even than alien residents—only if they are to be classifified together with convicted criminals and the mentally ill—can such a constitutional deprivation be upheld. For the right of all others to be heard and consulted on matters affecting them is embodied no less plainly within the guarantees of the first amendment than their right to speak upon public issues. The right of free speech has always been recognized as carrying with it the corollary right to be heard: it is for this reason that the first amendment explicitly protects not only the freedom of speech and assembly but the freedom of petition as well.

However, even where the constitutional right of consultation is granted to the blind, there are those who assert that they are "professionally unqualified" to exercise that right. The most frequent argument against consultation with organizations of the blind is that such groups are unprofessional and, hence, incompetent to make a meaningful contribution to the development of public policy. Aside from the simple untruth of this contention, there can be little doubt that the original source of the attitude which it expresses is the crumbling tradition of custodialism and dependency in which the blind have been held for centuries by charitable institutions entrusted with their welfare. Nor is it only private institutions and agencies which continue to maintain this view; public officials at the State and National levels are still largely recruited from such institutions and tend to share their assumptions concerning the capacities of their blind clients. Given the historic relationship between public welfare agencies and their private (or semprivate) counterparts, it is scarcely surprising that consultative procedures between the two should today be as close and highly developed as they are casual and underdeveloped with respect to organizations of the blind themselves.

It is a simple matter to demonstrate the concrete values of direct consultation by and with the blind in the conduct of their public programs. There are three distinct areas of governmental policy to which such consultation is especially applicable, each of them administered under the authority of the Department of Health, Education, and Welfare. The three are: (1) The public assistance program for the blind (42 U.S.C.A. 1201–1206); (2) the vocational rehabilitation programs (29 U.S.C.A. 31–42); and (3) the vending stand program (20 U.S.C.A. 107–107f).

In public assistance, the potential contribution to be made by the blind through their own organizations has been greatly augmented by the new and constructive approach which since 1956 has concentrated upon the objective of assisting blind persons "to attain the maximum economic and personal independence of which they are capable." The significance of this feature of the blind aid program cannot be overemphasized; every force that is capable of supporting the rehabilitative goals of self-support and self-care must now be brought to bear upon its administration. Among the most effective of such forces are, of course, the voluntary associations of blind people themselves, who for decades have been dedicated to the achievements of such a reorientation of the philosophy and objectives of public aid. If the new spirit of the laws is to find genuine expression in practice, the principle of consultation with the self-organized blind must be given full scope and recognition.

In the programs of vocational rehabilitation and employment, including those of workshops and vending stands, the broad goal of restoring the productive powers of blind men and women—together with the specific tasks of training, counseling, guidance, and placement—can obviously be facilitated through the active participation of organizations of the blind themselves. Without such consultation, indeed, there is little to counterbalance the regressive tendency of program administrators to limit the preparation of blind clients to those routine and stereotyped occupational channels which represent the path of least resistance. The modern objective of full integration of the blind within society on a basis of normality and essential equality is not likely to reach fruition until the blind themselves are permitted to contribute their accumulated experience

and insight through systematic participation—which is to say, through regularly established methods of consultation by officials with representatives of the

organized blind.

Although the custodial attitudes of condescension and contempt toward the blind still operate on various levels of administration to hamper effective consultation on a basis of mutual confidence and trust, I do not wish to give the impression that such attitudes are universal. On the contrary, in many States the close working relationships between agency administrators and organizations of the blind are highly productive and rewarding to both sides. It is no coincidence that these are also the States in which public programs of aid and rehabilitation for the blind are most enlightened and successful. No one who has watched, as I have, the development of these State programs through harmonious cooperation between the organized blind and their agencies of government can continue to doubt the vital importance of the principal of consultation or to question the right of blind men and women to speak for themselves and to be heard in the public conduct of their affairs.

INDEPENDENT-LIVING REHABILITATION

The objective which is sought by the enactment of independent-living legislation is extremely worthwhile; however, if legislation of the type proposedespecially legislation of the type now pending before this committee (H.R. 3465) should be enacted without proper safeguards, the disadvantages of such legislation would probably outweight any gains which might be realized from it. For more than a year the controversy concerning the independent-living bill has raged throughout the country. Blind persons have more to gain or lose by the enactment of this legislation than perhaps almost any other group. Independent-living legislation as a part of the Vocational Rehabilitation Act would not only affect the unemployable blind person, it would affect almost every vocational rehabilitation client in one way or another. Many services to the blind are not now considered as coming within the scope of vocational rehabilitation. This means that home teachers, for example, must be paid entirely from State funds, except in those instances where the home teacher works with a vocational rehabilitation client. The time spent in such work can be charged against vocational rehabilitation case service funds, but the redtape and recordkeeping involved are so cumberson that many States do not take the trouble to claim the Federal reimbursement. The result is that salaries and standards in the field of home teaching are far below those in rehabilitation. It is not difficult to see why this is so. If a State gets two Federal dollars for every State dollar that it puts into the salary of a vocational rehabilitation counselor, it can pay that counselor \$5,100 for a total investment of \$1,700 of State money. Thus, it will cost the State more to hire a home teacher at \$3,000 than a vocational rehabilitation counselor at \$6,000. If the independent-living bill were enacted, home teaching salaries would undoubtedly come within the scope of the legislation. salaries and standards would improve, and a broader program of services would be made available to the blind. This would be a clear gain and much to be desired.

On the other hand, the independent-living bill as it now stands would further complicate and confuse vocational rehabilitation services for the blind. It would likely mean that fewer blind persons would be placed in competitive

employment.

The "independent living" bill is a logical outgrowth of the 1954 amendments to the Vocational Rehabilitation Act. Before 1954 the emphasis in rehabilitation was on vocational training and job placement. The Federal regulations were so drawn that considerable incentive was given to the States to place disabled persons in competitive employment. The 1954 amendments as passed placed the emphasis on physical restoration and what has been called "medical rehabilitation." The Federal regulations were changed to reflect this new emphasis. The term "remunerative occupation" was defined to mean (subpt. A, 401.1p) "employment in the competitive labor market; practice of a profession; self-employment; homemaking, farm or family work (including work for which payment is in kind rather than in cash); sheltered employment; and home industries or other homebound work of a remunerative nature." A State could, and still can, claim a vocational rehabilitation closure on a person making 10 cents an hour, making no salary at all, drawing more public assistance than when the State rehabilitation agency took his case, making pot holders, or returning home to sit in an armchair (a "family worker") after having been operated

on for a cataract. Since "rehabilitations" of this type are counted as "closed, remuneratively employed," as are rehabilitations involving the more difficult task of placing disabled persons in competitive employment, the incentive is to make these easier "placements."

If the "independent living" bill should be enacted without substantial changes, it would continue the trend which was begun in 1954. Agencies for the blind would probably further deemphasize their job hunting and placement activities and would spend even more time testing, giving physical restoration services, counseling doing diagnostic work, and (most especially) helping the blind client

to achieve "independent living"—but not a job.

The 1954 amendments to the Vocational Rehabilitation Act and the proposed "independent living" amendments point up the differences between vocational rehabilitation of the blind and vocational rehabilitation of other disabled persons. The blind, of course, comprise only a small fraction of the total number of disabled people in the Nation. Therefore, administrative planning and program emphasis at the Federal level and in those States having no special vocational rehabilitation agency for the blind are usually in terms of the total

group, not in terms of the special needs of the blind.

The rehabilitation of the average disabled person usually involves medical work or some type of physical therapy—learning to use prosthetic devices, learning to walk or use muscles after polio, developing motor coordination, learning to live with one's limitations after a heart attack, correcting a speech defect, or learning to use a hearing aid or brace. In short, rehabilitation for the average disabled person who is not blind usually means physical restoration in one form or another, or some related process. When rehabilitation is viewed in this light, the 1954 amendments and the present "independent living" legislation are logical next steps. Increasing stress is placed upon diagnosis, medical services, therapy and physical restoration. Vocational rehabilitation services and hospital services are beginning to be regarded as related parts of one overall process. The disabled

person is more and more thought of as a "patient."

Rehabilitation of the blind, on the other hand, is something else again. The average blind person in need of rehabilitation does not have a health problem. He is not sick. He does not need physical restoration. Lenses will not help him. He cannot be taught new techniques for using his eyes. His needs are entirely different from those of the "patient." He must have help in adjusting to his blindness. He must come to an understanding of the fact that it need not keep him from doing the things he has always done. He must have training in skills and techniques—independent travel, braille and typing, etc., above all, he must have help in finding a job. The average blind man, just as the average sighted man, is not a good salesman. He needs a vocational rehabilitation placement man to help him convince an employer that he can do a job. Considered in these terms, the 1954 amendments did not advance rehabilitation of the blind. Nor, as now drawn, would the "independent living" bill do so. Medical help and physical restoration are vitally important services. They are necessary for the blind as well as other groups. The question is not their importance, but by whom they should be administered, what emphasis they should receive, and that their relationship is to vocational rehabilitation.

In view of the foregoing comments the following specific proposals are made:

(1) Public Law 565 should be amended so as to provide for Federal matching funds as grants-in-aid to the States for home teaching programs for the blind, regardless of what department of State government administers such program. The Federal share of the cost of the home teaching program should be the same as the Federal share for the State under section 2 of Public Law 565.

(2) If the independent living bill (H.R. 3465) or any similar legislation is enacted, any agency of State government should be permitted to administer the independent living program. If the independent living program for the blind is administered by a State agency which also administers to program of vocational rehabilitation for the blind, the personnel (other than administrative) engaged in the day-to-day operation of one program should not be permitted to spend any time working in the other program.

(3) Public Law 565 should be amended to require changes in the reporting systems of the State agencies doing rehabilitation of the blind, and in the reporting system of the Federal Office of Vocational Rehabilitation a more realistic definition of "remunerative employment" should be established, and a clear dif-

ferentiation should be made between types of rehabilitation closures.

(4) The services contemplated under the independent living legislation are greatly needed to promote the general welfare of the blind, but they should be

regarded more as health, welfare, and medical services than as rehabilitation, and they should be so planned and administered as not to weaken or water down the program of helping the blind to achieve regular, competitive employment. I thank you.

STATEMENT OF WENDELL P. BUTLER, SUPERINTENDENT OF PUBLIC INSTRUCTION, KENTUKY DEPARTMENT OF EDUCATION

While both rehabilitation and special education programs are for the handicapped, they are, by the nature of their programs, quite different in their aims, approaches, and services rendered. While rehabilitation services are designed to be rendered directly to the person seeking the service, special educational services are instructional in nature and the service of the State agency is directed more toward the local school system rather than a specific child or youth. These programs should be coordinated in an attempt to provide a continuous and logical program to the handicapped of all ages.

In view of the above distinction between rehabilitation and special education, we recommend that the implementation of Federal legislation and aid for special education programs be assigned to the Federal and State personnel responsible

for these programs.

SCHOLARSHIP

We recommend that consideration be given to Federal legislation providing scholarships for teachers of all types of exceptional children. We further recommend that this legislation provide for the allocation of a proportionate number of these scholarships to each State and territory of the United States, in addition to grants-in-aid to institutions of higher learning.

In this manner, we believe Federal legislation and aid could assist materially in alleviating local shortages of qualified special education teaching per-

sonnel.

HOUSE JOINT RESOLUTION 494

Title I: We recommend that consideration be given to the expansion of title I of this resolution to include aid for the training of teachers of hard-of-hearing children.

Title II: We recommend that consideration be given to the expansion of title II to include training of speech correctionists and audiologists on the undergraduate level in order to meet the great need for speech and hearing personnel in public school systems.

STATEMENT BY Mrs. J. A. RICHARDSON, AMERICAN SOCIETY OF BLIND PERSONS, DALLAS, TEX.

As president of the American Society of Blind Persons, I have requested time to present the views of our organization concerning pending and needed legislation for the blind. We believe that the following program if adopted would

be greatly beneficial to blind persons.

(1) One of the acute problems in the South and one which creates very real difficulty for many in Texas is created by the importing of brooms. Many of our blind people are engaged in the manufacture or sale of brooms. Because of cheap labor and inferior materials, the imported brooms are sold much cheaper than our blind manufacturers and salesmen can afford to market their products. Figures which we have obtained from a Mexican broom factory place the whole-sale price of a household broom at \$3.72 per dozen. Our blind manufacturers must receive for its equivalent made in the United States \$9 per dozen. There is a corresponding difference in the prices of other types of brooms. Information which we have obtained from the U.S. Tariff Commission state that the number of imported brooms has greatly increased during the past few years. We request—

(a) That the duty on imported brooms be raised.

(b) That the quantity of imported brooms be limited.

(2) One of the most profitable businesses in which blind persons are engaged is the operation of vending stands, many of which are on Federal property. I am a stand operator's wife. I believe that our experience will, quite vividly, depict the plight of stand operators. Our business is located in the lobby of the Terminal Annex Post Office. There is, on another floor of that building, an

employees' cafeteria. We have never questioned their right to operate this cafeteria, or done anything to curtail its business. On the third floor of the building, there were two drink machines from which we received the proceeds. The Post Office Department alleged that these machines were hindering production and ordered their removal. They were not taken out of the building, but were placed in the cafeteria area. In 1957 the cafeteria was integrated. Immediatelly business fell off to such an extent that they had to close. The Post Office Department then asked the General Services Administration to order the removal of the soft drink box from the lobby stand. I protested to our Congressmen. During the next 7 months the General Services Administration and the Post Office Department furnished them with a great deal of incorrect and misleading information. It is true that in our case vending machines have been installed from which we receive half the proceeds so that our income has not been greatly reduced. Some operators have lost heavily. We request, therefore that the Congress provide for the setting up in each region a neutral arbitrations board, and that this board shall be authorized to-

(a) Conduct fair hearings for stand operators.

(b) Conduct such hearings in the city in which the operator resides.

(c) Subpena such witnesses and such records as it needs in order to ascertain the facts in a given case.

(d) Hear an appeal by the State agency for the blind when that agency has been denied the right to install a vending stand in a Federal building.
(e) Make mandatory decisions except that appeal from the decision of the

board may be made to a Federal court.

(f) Interpret departmental regulations affecting vending stand and vend-

ing machines.

We request also that the definition of the vending stand be expanded to include snack bars,

We believe that in the distribution of aid to the blind, those who are unemployable, should be dealt with most liberally. We believe that in computing the resources of a recipient of aid to the blind, the first \$1,200 of income per year should be exempt. At present this applies only to earned income.

We will very much appreciate it if your committee will recommend to organizations of and for the blind that they attempt to settle among themselves any differences they may have concerning Federal legislation. In 1957 we organized the American Society of Blind Persons. Two of the purposes set forth in our bylaws were: To promote understanding and cooperation between the agencies engaged in work for the blind and the blind people of the United States, and to promote constructive legislation for the blind. With these purposes in view we have, on two occasions, asked for a conference of representatives of these organizations to attempt to reach agreement on proposals for legislation. Both attempts were unsuccessful.

We appreciate the opportunity to present our views on the needed legislation

for the blind. Thank you.

Mr. Elliott. The subcommittee has heard 34 witnesses today, and

we are going to recess until 9:30 in the morning.

I want to express the appreciation of the subcommittee to everybody who has helped out in this process of our own education today. You have been very kind, helpful, and thoughtful. We appreciate it and look forward to seeing you again tomorrow morning.

(Whereupon, at 5:35 p.m., the subcommittee recessed, to reconvene

at 9:30 a.m., Thursday, January 28, 1960.)

SPECIAL EDUCATION AND REHABILITATION

THURSDAY, JANUARY 28, 1960

House of Representatives,
Subcommittee on Special Education of the
Committee on Education and Labor,
Cullman, Ala.

The subcommittee met at 10 a.m., pursuant to recess, in the county courthouse, Hon. Carl Elliott (chairman of the subcommittee) presiding.

Present: Representatives Elliott, Green, Daniels, and Giaimo.

Also present: Representative Albert H. Quie.

Staff members present: Dr. Harry V. Barnard, research director; and Dr. Merle Frampton, director, study on special education and rehabilitation.

Mr. Elliott. The Subcommittee on Special Education will come

to order.

Today we have 32 witnesses scheduled. In order to accommodate everybody and in order that our friends may catch their planes this afternoon, it will be necessary that we push right along. We will have to limit our witnesses to 10 minutes, and I will have to be more careful that the 10-minute rule is observed today, I guess, in order to see that we do finish.

We are happy to have the interest that has been exhibited in these hearings. We are happy to have our visitors and friends attend and

show their interest as well.

We are happy to have my old friend Kelley Herring today, along with Joe Corry of Oakman, Ala.; the high school class in civics from the local high school; and Mr. Blalock from the University of Ala-

bama, with all of our other visitors and friends.

It appears that our weatherman has really played a trick on us today, in spite of our announcements about our fine weather in the Southland. But I hope by midday this may improve. I am atraid we will never be able to get our friends to believe that we have the fine weather for which we are famed if it does not improve soon. Vesterday was bad enough, I thought, but today is downright embarrassing.

Our first witness today is George G. McFaden, supervisor, Services for the Blind, Vocational Rehabilitation Division, Alabama State

Department of Education, Montgomery, Ala.

STATEMENT OF GEORGE G. McFADEN, SUPERVISOR, SERVICES FOR THE BLIND, VOCATIONAL REHABILITATION, DIVISION, ALABAMA STATE DEPARTMENT OF EDUCATION, MONTGOMERY, ALA.

Mr. McFaden. Mr. Chairman, and members of the Subcommittee on Special Education, I am George G. McFaden, supervisor of Serv-

ices for the Blind, in the Alabama Division of Vocational Rehabilita-

I wish, if I may, to testify in favor of the provisions of H.R. 3465 introduced during the 86th Congress by the Honorable Representative Carl Elliott of Alabama. The addition of the three titles to our present Rehabilitation Act, as provided for by H.R. 3465, would greatly extend and strengthen rehabilitation services for the severely disabled citizens of our State.

My remarks shall be limited primarily to the establishment of

workshops and other rehabilitation facilities.

Since the enactment of Public Law 565 in 1954, one of my responsibilities has been to help develop and plan workshops and other rehabilitation facilities. The Alabama Division of Vocational Rehabilitation has worked jointly with the Alabama Institute for the Deaf and Blind, county and city boards of education, State-supported trade schools and other organizations and institutions in the establishment of some 14 workshops and rehabilitation facilities. We have worked closely with the Alabama Society for Crippled Children and Adults, Inc., in the operation of some of these workshops and facilities.

There are certain limitations imposed under the provisions of the present Rehabilitation Act, Public Law 565, which cause unjust hardships and conditions which would be overcome by the passage of H.R. 3465. I would like, if I may, to give some specific examples.

Under the present act, Federal financial participation is available only for the expansion, remodeling, or alteration of existing buildings to adapt such building to workshop or rehabilitation facility purposes or to increase their effectiveness for such purposes. No Federal financial participation is available to construct a new building or to participate in expanding, remodeling, or altering a new building if it were intended in the original plans for the construction of the building that it would be used for a workshop or a rehabilitation facility. This limitation has caused a tremendous hardship financially and otherwise in establishing a comprehensive center and workshop for the blind at Talladega, Ala.

The officials of the Alabama Institute for the Deaf and Blind were willing to join with the division of vocational rehabilitation in establishing and operating a comprehensive rehabilitation center and workshop. The need for such a center and workshop had been established. Everyone was in agreement that it should be located at Talladega as this was the present location of the State-supported

school for both deaf and blind.

The Alabama Institute for the Deaf and Blind did not have an existing building that would be suitable to expand, remodel or alter to be used for this purpose. In fact, there was a dire need for the institute to carry out an extensive building program to meet the de-

mand for the regular school program.

We did the best we could under the circumstances. The institute obtained title to three old buildings located at Brecon on the outskirts of Talladega. These were poorly constructed warehouses that were used for temporary storage of ammunition and supplies during World War II. These buildings were not suitable, by any stretch of the imagination, to be converted into an evaluation, adjustment, training, and workshop center for the blind. However, having no other alter-

native, the institute and the rehabilitation agency in a piece-meal fashion, in order to comply with existing regulations, have over a period of 4 years, developed one of the most comprehensive rehabilitation centers and workshops for the blind in the country.

It would have been much more feasible and economical to have constructed a new facility that would have been more permanent and

certainly better adapted to the purpose.

Another example illustrating how undue hardships were imposed by existing restrictions is the Mobile Association for the Blind. Here again we were forced to expand and remodel an existing building which was not suitable for this purpose instead of constructing a

suitable building to house a workshop for the blind.

The Mobile Association for the Blind has an old building which could be sold. The proceeds from the sale of this property could be used to match Federal funds in the construction of a much more adequate and suitable building for the facility if it were not for the two restrictions in the present law, namely, the use of the funds of a non-profit agency to match Federal funds and the construction of a new building. The passage of H.R. 3465 would remove these restrictions.

I do not believe it is the wish of the Congress to continue to impose such restrictions to the development of rehabilitation facilities and

workshops of this nature.

The needs for the deaf are similar to those for the blind. Specialized facilities for diagnostic evaluation and training of the deaf are necessary for successful rehabilitation. The Alabama Institute for the Deaf and Blind and the division of vocational rehabilitation are completing plans to establish a comprehensive center for the deaf similar to the one now in operation for the blind. We will encounter some of the same restrictions unless the present regulations are amended.

The establishing and operating of a specialized comprehensive rehabilitation facility is expensive. We have learned through experience that a period of several years is required before a comprehensive facility of this nature can be properly staffed and put into full operation. We feel that continued Federal participation beyond a 1-year period for staffing such a facility will greatly expedite the development of more comprehensive facilities. This, with Federal participation, in the training of key personnel, will help to overcome some of the difficulties now encountered in establishing and operating workshops and rehabilitation facilities.

Thank you, sir.

Mr. Elliott. Thank you very much, Mr. McFaden.

Are there questions of Mr. McFaden?

If not, we thank you, Mr. McFaden, for your fine testimony.

Mr. Elliott. Our next witness is Mr. John Wallace, President of the Florida State School for the Deaf and Blind at St. Augustine, Fla.

STATEMENT OF JOHN WALLACE, PRESIDENT, FLORIDA STATE SCHOOL FOR THE DEAF AND BLIND, ST. AUGUSTINE, FLA.

Mr. WALLACE. Mr. Elliott, Mrs. Green, and other members of the committee, I, too, am very happy to be here to appear before you a few minutes. However, I doubt if I could add too much to what other

members of our workshop have added. But there were a few points

that I wished to emphasize.

The Florida school is the second largest residential school in the country, having departments for both deaf and blind children, Negro and white. We have 634 students with a teaching staff of 80. In this staff, 30 of them are in our departments for the blind, and of these 30 instructors only 1 had previous training to teach blind children before coming to us. This one Negro instructor was trained by Dr. Frampton in New York.

Therefore, I want to emphasize the importance for establishing more training centers or teachers and personnel for visually handi-

capped children.

As far as I know, there are only five recognized training centers at this time: Syracuse, Peabody, Hunter College, Perkins, and San

Francisco State.

There certainly is a great need for Federal grants-in-aid or scholarships to influence worthwhile people to come into this very important work. That, of course, is true for both visually handicapped chil-

dren and hearing-handicapped children.

One of the most alarming things that we see is the children who come in with multiple handicaps. So many of our visually handicapped children have a second or even a third major handicap. Some of these children are emotionally disturbed. Some of them are prepsychotic. There are no regional diagnostic residential centers where these children can be sent for observation and treatment.

To me, that is one of the most urgent needs. In these diagnostic centers they could train various staff members to help these children. Also, we need more careful screening so that children may be more

properly placed.

Most of the recommendations will be included in Mr. Woolly's report. We were in that workshop for 2 days in Atlanta. So I will not

cover the points that will be made there.

Another important thing is the expanding need for educational equipment. Every legally blind child is allowed approximately \$30 for equipment, and there is a ceiling on that at the American Printing House. This is to be raised if each child is to be supplied with this very important and expensive educational equipment and educational aids. For instance, in Florida 400 children are registered at the American Printing House for the Blind; 175 in the residential school, and over 200 in the public schools. However, they cannot get the equipment needed, and we are unable to supply them with this.

I would like to point out the expense of just a few items. For instance, a braille writer, a Perkins writer is in the neighborhood of \$92. Braille maps and globes are around \$300. We have world history books where the volumes cost \$70 per set. We happen to have

six sets of those.

So that will give you some idea of just a few of the materials that

are needed.

A study that was made in New York State of blind children, as of October 1956, had 2,773 children under 21 years of age, and since New York has nearly one-tenth of the population of the United States, it can be estimated that there are somewhere between 30,000 and 35,000 visually handicapped children under 21 years of age in the country. Of course, many of these may not be educable.

I would like to point out the main things are scholarships to train personnel, the establishment of regional diagnostic centers, and expanding educational equipment.

Mr. Elliott. I recognize Mrs. Green.
Mrs. Green. What is the definition of a legally blind person?

Mr. Wallace. It is usually considered 20 over 200.

Mrs. Green. Is that the legal definition?

Mr. Wallace. That is the legal definition of blindness. Of course, there are many children in our schools who have more sight than that but need our special help.

Mrs. Green. How is this definition established?

Mr. Wallace. I presume medical men have established that. Mrs. Green. Is that uniform throughout the United States?

Mr. Wallace. Yes.

Mrs. Green. I was thinking it was much less than that.

Mr. Daniels. Mr. Wallace, you said there were five schools for the training of visually handicapped people. Do you know how many teachers were in training in those schools in 1959?

Mr. Wallace. No, I do not.

Mr. Daniels. You do not have any figures?

Mr. Wallace. But I know that I have been head of a residential school for 15 years, and I have never had but one application from a person who had had training with the blind prior to that.

We have employed people who have had experience in other schools. Most of us give inservice training. It is necessary, and we hold

workshops.

So most of our personnel have received on-the-job training.

Mr. Daniels. Thank you.

Mr. Wallace. One girl we sent to a training center, to Peabody, after she received her Master's degree, and then she went west.

Mr. Elliott. That is all too often the case, is it not?

Mr. Wallace. Yes.

Mr. Elliott. The gentleman from Minnesota, Mr. Quie.

Mr. Quie. You said we needed more training centers. Do you think there is a possibility that facilities are sufficient in those five to greatly expand the number of teachers they turn out each year, if some assistance, similar to what is proposed for the deaf and speech-corrective teachers, were given for the blind?

Mr. Wallace. No. I think many more centers are needed, because teachers in training must have places where they can do their prac-

tice teaching.

Many of these schools, while maybe they do not have as many trainees as they could take, they would not have the facilities to take care of large groups.

Mr. Quie. How many would be needed each year to take care of

your needs?

I imagine that, no matter what happens, a substantial number of

your teachers would be trained in your schools.

Mr. Wallace. Yes. I have no idea how many would be needed, but I know that in our day classes in Florida, I receive letters wanting me to recommend a teacher for their special classes. In most cases, they just employ a teacher.

Mr. Quie. Do the public schools of Florida have some classes for

the blind?

Mr. Wallace. Yes. Small day classes. Some of them are placed in classes with normally situated children. However, many of these small day classes, they will often have hard-of-hearing children, blind children, one with cerebral palsy, and many of the special classes have a number of different types of handicaps in one schoolroom, which is very undesirable.

Mr. Quie. It is practically impossible for a person to be well

trained in handling all of the handicaps; is that right?

Mr. Wallace. That is true.

Mr. Quie. As you went along you said that many of these 30,000-35,000 blind probably would not be educable. Is the incidence of mental retardation in the blind much greater than, we will say, in

sighted people?

Mr. Wallace. I have no figures to bear that out. I would not know except that I do know that we are beginning to see more and more visually handicapped children with additional handicaps; for instance, brain damage, cerebral palsy, epilepsy.

Mr. Quie. Is that because so many of the children are received at

childbirth?

Mr. Wallace. That is right, possibly. Many of the premature babies are received.

Mr. Elliott. Thank you very much, Mr. Wallace.

Mr. Wallace. Thank you.

Mr. Elliott. Our next witness is Dr. W. W. Wilkerson, Jr., medical director of the Bill Wilkerson Hearing and Speech Center of Nash-

ville, Tenn.

We are happy to have you, Dr. Wilkerson, and I doubt if there is a member of this committee who is not familiar with your deep and untiring devotion to this cause. We look forward to what you have to say. We regret that we must impose the time limit.

STATEMENT OF DR. W. W. WILKERSON, JR., MEDICAL DIRECTOR AND CHAIRMAN, THE BILL WILKERSON HEARING AND SPEECH CENTER, NASHVILLE, TENN.

Mr. Wilkerson. Hon. Carl Elliott, and distinguished members of the House Subcommittee on Special Education, I am grateful for the opportunity to present testimony on behalf of House Joint Resolution 494, introduced by Mr. Elliott, and companion resolutions.

I wish to congratulate you on your previous achievements. Though wholeheartedly supporting part I of this bill, I shall only discuss the need for part II, as I am more informed in that area.

In order to avoid repetition of previous testimony, I shall discuss the national needs rather than the problems of this region.

Of Tennessee, I would say that we are very proud of our hearing and speech program, of the fine centers, superbly equipped.

We need trained personnel in Tennessee as badly as any other State in the Union. As a matter of fact, we are delaying at our own center a doctoral program because of the lack of qualified personnel.

With the leadership of Representative Fogarty in 1955, for the first time, to my knowledge, Congress specifically supported a hearing and speech program. Yet, comparatively little has been done for the

largest segment of our disabled population, those persons with hear-

ing and speech defects.

The Public Health Service of the U.S. Department of Health, Education, and Welfare, published two surveys; one, compartments by types, sex and age, July 1957 to June 1958; and, two, health statistics, children and youths, selected characteristics, for the same date.

The first of these surveys deals with the handicapping disability

of all ages, and shows the following pertinent facts:

Hearing and speech defects were most frequently listed as untended with only 6-8.1 and 59.3 percent, respectively, being seen by a

physician.

There were 23,815 impairments found in this survey. Incidentally, it was a survey of 36,000 homes, involving 115,000 people. Of this number—23,000—there were 5,714 with hearing impairments, 1,098 with speech defects, total deafness in 109; visual impairments, including blindness, 3,024; mental retardation, 240; cerebral palsy, 112.

Broken down into percentages, hearing and speech impairments accounted for 29 percent in all ages. In the next largest group—

visual impairments—the percentage was only 8.7 percent.

In other words, hearing and speech impairments, percentagewise, were almost four times as large as in any other single impairment.

Based upon the population of the United States, this health survey states that there were 24 million impairments and that 7 million of these were hearing and speech impairments.

While these figures are most conservative, the survey reveals more than one-third of all impairments are due to hearing and speech

defects.

In the publication dealing with children and youth, from age 0 to 14, the percentage of visual impairment is 8 percent; orthopedic, 36 percent; hearing and speech defects, 41 percent. For ages 15 to 24 the percentage of visual impairment is 7 percent, hearing and speech impairments 23 percent, orthopedic 59 percent, These figures represent the distribution of impairments in handicapped groups.

It is generally estimated that 50 percent of those persons handicapped with hearing and speech defects have major disabilities. This means that over 20 percent of the age group of 0 to 14, and 11 percent in the age group of 15 to 24 have major disabilities compared to three-

tenths of 1 percent in the largest group, orthopedics.

The number of colleges and universities training audiologists and speech pathologists from 1953 to 1954 was 115. I do not have more recent information, but I think the facts would be virtually the same. Only 12 of these institutions granted one or more Ph. D. degrees, and only 53 granted one or more masters degrees.

According to material prepared by the Department of Education as of July 1, 1957, based on membership in the American Speech and Hearing Association, there was only an average of 128 persons graduated in hearing and speech with a master's degree, and 31 with a

doctoral degree since 1949.

The passage of this resolution is needed because, one, a program for work of this magnitude should have direct authorization by the Congress; two, it will give stature to a great humanitarian need; three, it will develop professional workers interested in all hearing and speech problems for all people regardless of age, vocation, nonvocation, education, or finances.

A major program, rather than a subdivision of some agency unde-

fined by Congress, should be developed.

The Office of Education has for many years had the Federal responsibility of the teachers of the deaf program, and has done an excellent job. Its experience in this field will augment part I of this resolution. The Office of Vocational Rehabilitation has a hearing and speech program with great merit.

Therefore, to utilize the great experience and the fine personnel versed in this graduate training program, part II of this resolution is properly placed in the Office of Vocational Rehabilitation.

A broad base is needed for the development of a program as anticipated under part II, as the field of communication covers many facets, such as geriatrics, psychiatrists, surgery, pediatrics, medicine as a whole, audiologists, speech pathologists, psychology, rehabilitation, physics, social service, and so forth.

It is easy for one such as I to urge that this resolution be placed on the agenda of the House of Representatives at this session, as I carry neither the responsibility nor the knowledge requisite for enactment of legislation. Yet, I would urge action for the following reasons:

One, based on statistics, it seems that this resolution should receive

top priority in the field of care for the handicapped.

Two, there is an urgent need each year, with an increase of population, the problem becoming more acute: deafness of individuals in the armed services, industry, and the veterans' group constantly rising.

You will be interested in knowing that I was just recently told that the aerospace development program had to discard 130,000 hearing tests because of the fact that the personnel that made the tests were not qualified.

Three, many Congressmen have manifested their interest in the

passage of this resolution.

Four, if this resolution is not passed at this session, the entire legislative procedure must necessarily be begun anew at the next session, with some change in membership in each House.

Five, the passage of this bill will establish a pattern for other needed legislation in the general field, and will in no way interfere with subsequent legislation as needed in the hearing and speech field.

It was realized by the hearing and speech division of the workshop, just held in Atlanta, that the passage of House Joint Resolution 494

would not answer all the needs.

This will not appear in your report, and that is the reason ${f I}$ am giving it to you. However, it was unanimously approved, so far as I could tell, as it was thought that the passage of this said resolution would answer our greatest needs.

As you know, many individuals and organizations unselfishly interested in this problem are urging the passage of this resolution. The fruits of its passage will strengthen our Nation socially and finan-

cially, and bring hope to many currently unhappy homes.

Mr. Chairman, if this was an organizational meeting with you as chairman, and your subcommittee as officers of said organization, I would move, sir, that we give you a rising vote of thanks for your devoted labor of 2 days. As it is, I will just say thank you. I appreciate your coming to the South.

Mr. Elliott. Thank you.

We have enjoyed your testimony, Dr. Wilkerson, and enjoyed seeing someone with devotion and the inspiration that you have for this cause.

(Dr. Wilkerson's full statement follows:)

STATEMENT BY DR. W. W. WILKERSON, JR., MEDICAL DIRECTOR AND CHAIRMAN, THE BILL WILKERSON HEARING AND SPEECH CENTER, NASHVILLE, TENN.

Mr. Chairman, members of the Subcommittee on Special Education, and guests, I am privileged to have the honor of testifying before this distinguished body in favor of these resolutions.

GENERAL DISCUSSION

Individuals who are handicapped with hearing and speech difficulties do not present a dramatic picture. One's sympathy is not automatically aroused as, for instance, it is in cases of lameness, blindness, or cerebral palsy. Hence, the hearing and speech victims frequently are objects of ridicule; often are considered stupid, even if they have normal or high I(D's; may be unjustifiably placed in homes for feebleminded; or may suffer from difficult family relationships. Can't each of us recall the teasing which a stutterer or cleft palate child received at school?

Fifteen percent of adults over 65 years of age have hearing and speech defects. More children are handicapped with hearing and speech disorders than from any other single cause. Yet neither foundations, nor wealthy individuals, nor governmental agencies have given more than token aid to those persons. Since a larger percentage of cases with hearing and speech disabilities can be restored to a productive life than in any other handicapped group, isn't it re-

prehensible that so little is being done?

Communication between individuals is a basic human need; only humans can talk. Communication is necessary for a normal religious, emotional, social, and economic life. Without hearing, one would never listen to music, or hear his mother's voice. Without ability to talk, one is a social outcast, shunned, merely watching life from the sidelines. If not also blind, he sees, but without anderstanding. He is unemployable in the true sense of the word.

CONDITIONS AND DISEASES COMPLICATED WITH COMMUNICATION PROBLEMS

What are some of the causative factors for loss of normal communication? Poliomyelitis of the paralytic type, cerebral palsy, and brain injury may cause partial or complete paralysis of the nerves controlling the voice, and also may involve the sense of hearing. While these complications are not uncommon, no actual statistics as to the percentage of cases so affected are

available.

Hereditary defects frequently produce all types of hearing and speech problems of varying intensity. Such cases frequently are considered deaf, although a small amount of hearing is usually present. They naturally have no speech, as one cannot learn to speak without having heard speech. In Nashville we have, at this time, 52 cases of this type in the special acoustic classrooms of our county school system. These severely damaged cases will learn to speak and receive at least some education. We are fortunate in having excellent hearing and speech personnel for these classes. It is remarkable that one-third of these children, who had neither hearing nor speech before coming to the hearing and speech center, will enter a regular grammar school and receive a normal education.

Some speech impediments are due to environment. Parents, through overeagerness, or impatience, may induce children of certain types to stutter.

Mental health and social adjustment problems are the rule in persons handicapped with hearing and speech defects. Dr. Arthur J. Lesser of the U.S. Children's Bureau has stated: "It is obvious that impairment of hearing in a child sets up a chain of disturbances in his development which affects seriously his mental, emotional, and social development." It is, therefore, understand-

able that a large category of the patients in mental hospitals and clinics are there primarily because of communication problems. To put it another way, the mental health problem will decrease in magnitude with favorable action

by the Congress on this resolution.

The Department of Medical Genetics, New York State Psychiatric Institute, Columbia University of New York City, under the sponsorship of the Office of Vocational Rehabilitation has recently collected information "on over 10,000 cases of deaf residents of New York State, including many who had neverbeen to school and were living on isolated farms or more or less anonymously in rural homes and institutions." Since this survey was necessarily incomplete, I am sure that the number of persons so situated is far in excess of 10,000. This is tragedy of the highest order.

Recently it has been estimated that 2,500 patients have their voice box removed each year because of cancer. Yet, without proper voice training, i.e., speech sounds made in an abnormal manner, none of these persons can return

to a normal activity. Without training, they remain mute.

Apoplexy, a "stroke," is a hemorrhage into the brain. Unless the hemorrhage is quite small, it usually produces a paralysis of some part of the body. Frequently speech is affected. It also may produce aphasia, i.e., failure to call objects by their correct name, or failure to associate a word or name properly.

Viral diseases may produce loss of hearing. Scarlet fever, and measles, particularly in the early months of pregnancy, may cause many disabilities

including deafness of the newborn.

Cleft palate occurs in about 1 out of 700 births. This causes both speech impairment and loss of hearing. A team of highly trained professional personnel, including physicians, speech pathologists, orthodontists, etc., is required for

the attainment of a successful result.

Industrial and occupational deafness, due to the exposure to loud noises day after day, produces a loss of hearing in many persons. An old medical term, "boilermaker's deafness" is most expressive. However, it is now recognized that such deafness occurs in all heavy industries, workers around jet planes, and in aviators flying both in the military and civilian planes. Until recently, no provisions under workmen's compensation laws recognized this disability. Fortunately, and correctly so, a few States now provide for compensation for such loss of hearing. Much more legislation is needed in this field.

NEED FOR COMPREHENSIVE FEDERAL GRADUATE TRAINING PROGRAM, CONCENTRATED IN ITS ENTIRETY TO HEARING AND SPEECH

No figures or percentages estimating the number of people affected with hearing and speech disorders are entirely accurate. Due to the lack of trained personnel, the majority of our children, workers, and adults in general have not even been tested.

I have stated on numerous occasions that 10 to 15 percent, or 20 million of our population were handicapped with hearing and speech defects. However, recently Dr. Aram Glorig, director of research, Subcommittee on Noise of the Committee on Conservation of Hearing of the American Academy of Opthalmology and Otolaryngology, stated that, based on sound statistics, approximately 20 million males between ages of 10 and 59 are estimated to have a definite loss of hearing, and of these, one-fifth, or 4 million have a severe hearing loss. Adding these figures to the number of females handicapped with hearing and speech defects, one obtains an astronomical figure. However, more males are involved than females. It is estimated that 1,700,000 males between the ages of 50 and 59 are entitled to workmen's compensation due to hearing loss.

At least 10,000 children are forced to quit school each year because of hearing or speech disability, or 100,000 every decade. Do these children not deserve

the same consideration as the dull or noncooperative students?

It is estimated that there are only 4,000 workers in the hearing and speech field, and that at least 50 percent are poorly trained. Further, it is estimated that a minimum of 25,000 additional professional qualified workers are needed now.

According to material prepared by the Department of Education as of July 1, 1957, there was only an annual average of 128 persons graduating in hearing and sneech with a master's degree, and 31 with a doctoral degree since 1949. The services of some of these persons are lost because of marriage and for other

reasons. This same publication states, "The most serious obstacles to provision of needed services for this large group of handicapped children are an acute shortage of trained personnel and lack of sufficient knowledge, etc." It also stated that only one child in five received needed care, and further that "It would seem that State departments of education, local school units, and colleges and universities, face an all but insurmountable task in meeting this enormous problem."

COMPARISON OF FREQUENCY OF HEARING AND SPEECH DEFECTS WITH OTHER HANDICAPPING DISABILITIES

Dr. A. R. Shands, Medical Director of the Alfred I. Dupont Institute states that less than 1 percent of the children are handicapped with cerebral palsy; 3.2 percent of the children are handicapped with mental retardation. American Foundation for the Blind states that one-third of 1 percent of schoolage children are handicapped with blindness.

Think how much has been done by national foundations, individuals, and governmental agencies for the above handicapped groups, and how little has even been attempted to aid the much larger group of children just as severely handicapped with hearing and speech defects. Dr. Shands further stated that he would prefer any handicap in preference to loss of communication.

COST IN DOLLARS TO THIS NATION

Since there is no way to evaluate the suffering and heartaches in any disability. I shall only discuss the cost in money. The Veterans' Administration is paying annually \$42 million in compensation for service-connected hearing loss, and additional sums for hearing aids and their upkeep. I do not know the cost of the hearing losses of the non-connected-service cases, Much of this money could be saved if methods of prevention were developed.

The potential cost to industry is enormous. It is conservatively estimated that 1.700,000 persons in the age group of 50 to 59 years have work-connected hearing losses. Under the workman's compensation laws of Wisconsin and Missouri, if the claims averaged \$1,000, the total cost in this age group alone would be \$1\% billion. This figure gives no consideration to other age groups. Most of this

money could be saved by prevention.

No one knows the cost of operating the hearing and speech centers of this country. However, we can state that the centers in Tennessee spend a minimum of \$600,000 annually, excluding any funds for depreciation or real maintenance. Over \$2 million is invested in buildings and equipment. Every center in my State is understaffed, as professional personnel simply is not available.

Based on the survey made in New York, mentioned previously, and applying these figures to the total population of the country, it is estimated that over 103,000 deaf persons are in institutions, or hidden away in homes. At a cost of \$600 for mere maintenance per year per person, the total cost to the Nation is almost \$62 million. Some of this could be saved. Costs of other groups and intangible expenses cannot be estimated.

The greatest expense to this Nation is the loss of income of many of these persons, a great horde with no income. If these people were paying their potential taxes, perhaps income taxes could be reduced. To say the least, it would be an

enormous sum.

ENACTMENT OF RESOLUTION

Results: Many additional speech pathologists, audiologists, teachers of the deaf, and other paramedical specialists will be added to the present short supply; existing teaching institutions will be stimulated and augmented by new ones; standards in these fields will be elevated; programs for recruiting students into these professions will be augmented; research workers will learn new methods for control of noise in heavy industry, better methods of testing hearing, means for prevention of hearing and speech disabilities, and more effective courses for habilitating and rehabilitating those individuals already affected. Teachers will be trained for teaching other students on the graduate and undergraduate level. With an increased corps, additional centers for rehabilitation, teaching, and research will develop throughout the Nation. Shortage of personnel definitely retards the development of these needed centers at the present time.

With an advisory committee of outstanding men and women representing many facets of the hearing and speech field, a comprehensive and coordinated program will be developed. It will obviously require time to plan the basis for

such a program

A working conference on health aspects of hearing conservation, initiated by the departments of public health and vocational rehabilitation in May 1959, was: attended by a large number of persons representing many professions involved in hearing and speech work. Both civilians and representatives of government: were present. The following resolution was passed unanimously: "This conference recommends increased financial support of existing programs and creation of additional programs of support for the training of all shortage category personnel concerned with medical, audiological, educational, and research problems of hearing impairment."

There are precedents for legislation, such as is proposed in this resolution, to be found in certain training programs of the Department of Health, Education, and Welfare, and the National Defense Education Act of 1958. These governmental agencies are interested in the hearing and speech problem and are doing excellent work, despite the fact that their authorizations lie in a larger field, with graduate training in hearing and speech as only a small subdivision of their total interest. The number of persons handicapped with hearing and speech defects makes it imperative that units or subunits of government be given full responsibility for this important program. Also, there is no Federal law enabling

a program to develop as specified in this proposed legislation.

Teaching institutions have been, and are, utilizing every known method toraise additional funds for teaching hearing and speech personnel, yet, year after year, because of lack of funds, relatively few persons are trained.

Some may say that local and State agencies should support all teaching programs in this field. State and local governments simply cannot cope with the problem, particularly in view of the fact that a great percentage of graduates in hearing and speech do not remain in their local areas. Graduates from my center, which has been teaching students for only 7 years, are now located in approximately 22 States. Truly, then, this is a Federal responsibility. Teaching institutions are pleading for the opportunity to serve. The handicapped persons are praying for help. For these handicapped people, I beg for your approval of this resolution. Humanity truly needs your help.

Mr. Elliott. Our next witness is Miss Roberta Morgan, Jefferson County Coordinating Council of Social Forces, Birmingham, Ala-

Is Miss Morgan here?

If Miss Morgan is not here, may I say that our next witness is Mr. J. J. Benford, past president of the Alabama Rehabilitation Association, Albertville, Ala.

STATEMENT OF J. J. BENFORD, PAST PRESIDENT, ALABAMA REHABILITATION ASSOCIATION, ALBERTVILLE, ALA.

Mr. Elliott. Mr. Benford, we are happy to have you. We recognize also the fact that you are a member of the Alabama State Board of Education.

I regret that we must limit you to 10 minutes of testimony. But, with that understanding, you may proceed.

Mr. Benford. It is a pleasure to be here, Mr. Chairman, and members of the committee.

I come here as a private citizen, not as an expert in any of these fields. My remarks will be rather limited, but I would like to point out two or three facts, and, in two departments that your committee has under consideration, the special education problems of the mentally retarded, and I will follow that with a few remarks regarding rehabilitation needs in our State.

Thirty out of every thousand persons in the United States are classed as mentally retarded. This, therefore, represents a considerable segment of our population.

Who is a mentally retarded child?

He is a child with an impaired intellectual development, incapable of being educated properly and effectively through ordinary classroom

facilities with normal children.

Out of this 30 mentally retarded children, 25 of them are classed as educable, and 4 out of that 30 are classed as trainable; that is, who might be taught to look after themselves and their own personal needs at home. And 1 out of the 30 is classed as totally helpless, and will probably need custodial care throughout his life.

The group that I am interested in is the 25 who are educable. They may profit from special educational facilities to make them economically useful and socially adjusted. His mental development is ap-

proximately one-half to three-fourths that of the average child.

The educable retarded can usually learn enough reading, arithmetic, and things like that to meet his daily needs. He will require special help for vocational placement, but may become self-supporting and capable of handling his own affairs throughout his life with some coun-

The greatest problem of dealing with children in this class, then, is

a lack of trained teachers to handle these groups.

If some incentive could be offered to interested teachers to take training in this field and other fields of exceptional education, we would have gone a long way toward a solution to the problem of exceptional education, particularly regarding these mentally retarded boys and girls.

Now I would like to go directly into the field of rehabilitation.

I believe the main emphasis in our State over the years has been placed upon vocational rehabilitation, and during the years I have

had some rather close association with the program.

Figures which I am about to give you—and I assure you there will not be many of them—are taken from the records of the State rehabilitation service, and I have taken the liberty to round them out instead of giving the exact figures.

Since 1956 in Alabama the clients of the rehabilitation service—cases which have been closed as employed—in 1956 numbered about

1,950; 1957, 2,070; 1958, 2,240; and last year, 2,360.

This does not represent all the people in Alabama who had physical impairments and needed vocational rehabilitation. The current

backlog is around 10,500 people who need this service.

The limitations of training are the staff, money, and facilities for handling. During the past 12 years this backlog of people needing vocational rehabilitation has increased in spite of additional staff and more facilities and increased budget. This backlog is due largely to the fact that we have about 5,000 people in Alabama suffering some disabling accidents or becoming disabled for some reason each year.

In 1956 we had 2,600 in round figures accepted for vocational rehabilitation; that is, actively on the list. In 1959 we had 3,080.

Alabama today has 14 facilities designed to help serve the more severely disabled who could not be served in the regular facilities available, such as hospitals, trade schools, and institutions of higher learning. The average daily capacity of these facilities, excluding the one in Mobile, is approximately 200. So you can see that 200 does not nearly meet the needs for rehabilitation in our State.

The number closed from the department of welfare rolls in 1959

was 430.

I might say that the average payment by the welfare department—the department of pensions and security, it is called in our State—the average payment per year in 1958 was \$456. The average cost of rehabilitation of clients is only \$435. That is a one-time expenditure whereas the welfare payments continue on and on year after year as long as they are on the rolls.

So, just from the standpoint of pure economy, it would pay us to

look after rehabilitation of these people who need it.

I would like to give you a bit of personal experience in the field of vocational rehabilitation. For 23 years I owned and operated a printing business and a weekly newspaper. My first employee was a rehabilitation client who had started his training on the job in a shop down the street. He continued the training after coming with me.

I was so impressed with his work that I contacted the State rehabilitation service, and some of those gentlemen are here in the house today whom I contacted, and requested other trainees. They supplied my

needs throughout the 23 years.

All these fellows were handicapped physically, and were eager

to learn in order to become self-supporting citizens.

Only two shop employees during the 23 years that I operated this business were not physically handicapped. All the others were handicapped and trained on the job in the shop. Some of these men might well have been beggars on the streets, or clients of public welfare, or wards of some charity. Each has become a respected citizen and a self-supporting taxpayer in the community. Each of them has paid back in taxes many times over the cost of his rehabilitation.

As I see it, the great need now is for more facilities, for training, and for additional personnel to service the program of rehabilitation.

I thank you for the privilege of appearing. Mr. Elliott. Thank you, Mr. Benford.

Our next witness is Mr. R. B. Bagley, supervisor, Crippled Children's Service, State Department of Education, Montgomery, Ala.

STATEMENT OF R. B. BAGLEY, SUPERVISOR, CRIPPLED CHILDREN'S SERVICE, STATE DEPARTMENT OF EDUCATION, MONTGOMERY, ALA.

Mr. Bagley, Mr. Chairman and members of the committee, I am R. B. Bagley, supervisor, State Crippled Children's Service, State Department of Education, Montgomery, Ala.

The State crippled children's service is a section of the division of

rehabilitation and crippled children's service.

This service is closely coordinated with the vocational rehabilitation service and the program of education for exceptional children. The crippled children's service accepts responsibility of bringing about maximum physical improvement in crippled children in order that they can take full advantage of educational opportunities as well as social and emotional growth. All of these factors are directed toward the ultimate vocational rehabilitation of these children.

I would like to bring to your attention some of the problems confronting this service in the State of Alabama. I am sure these same

problems would be applicable to the crippled children's services in the other Southeastern States.

The first problem is the need for more Federal funds in serving

these children.

The Congress has authorized a \$20 million appropriation to the Children's Bureau for the crippled children's program. The President has recommended to the Congress in the budget of the United States Government for the fiscal year ending June 30, 1961, \$16,667,000 for services to crippled children. It is our belief that the full \$20 million authorized by the Congress should be budgeted. Our belief is based on the following facts:

(1) The per diem cost of hospitalization has more than doubled in the last 8 years in this area. At the present, the crippled children's service is paying less than half of the audited reimbursable cost at cooperating hospitals. These hospitals cannot

continue on this basis indefinitely.

(2) Prosthetic devices, which are artificial limbs, braces, cor-

rective shoes, have more than doubled in price also.

(3) Adequately trained personnel is at a premium and only comparable salaries paid in business and industry will attract and hold these people in positions rendering services to the handicapped.

(4) The cost of travel for professional personnel, both in lodging and operation and maintenance of automobiles, has in-

creased markedly.

All of these needs mentioned are necessary to maintain the program already in existence. It does not include any need for expansion of personnel or additional services to crippled children. I am sure that each of you will recognize that the more nearly normal a crippled child can be made in its childhood, the less burden he will be in later life on other public agencies, namely, vocational rehabilitation, public assistance, and public health.

At the present time there are over 400 children on the waiting list for hospitalization in this State for whom surgery has been recommended by the doctors on the staff of the crippled children's service. These are not children who have been selected for elective surgery, but these are children for whom the doctors feel that only surgery will

correct or alleviate the existing crippling conditions.

We all recognize further that it is almost impossible for the badly handicapped child to attend regular classes in school. We also recognize that an enlightened and educated citizen is a better citizen.

The State of Alabama recognizes the need of education for these severely crippled children, and a special education program has been established. The crippled children's service, cooperating with the school authorities, has attempted to screen all of the crippled children for the public schools and to furnish therapy for the children in the special classes. Because of the shortage of staff, it has been impossible to be of much help to the schools in this program.

Bear in mind that this help has been directed only to those children with physical disabilities, and no attempt has been made to assist those

with mental disabilities.

There is another group of severely handicapped children that has not been recognized in the Federal program, nor in many States.

That is the custodial-type child. There are a great many of these children who are so severely handicapped, both physically and men-

tally, that they can never compete in society.

In the State of Alabama there are several private groups who have established custodial homes. In these homes they not only care for the children, but they give as much therapy and training as the child

is capable of absorbing.

Several years ago the legislature in Alabama appropriated a small amount to serve these children. The crippled children's service has worked in cooperation with these privately owned homes, and has kept about 15 to 25 children in there at all times, rotating these children every 3, 6 months. The reason for this rotation is shortage of funds and the number of children needing this service. Around 750 children have been served in this program since this first allocation was made by the legislature.

The Spastic Aid of Alabama, in Birmingham, has cared for about 600 children. They have cooperated with the State service by bearing

part of the cost of a great number of these children.

It is our belief that this program should be recognized by the Federal Government and this service be considered along with other crippling conditions, and that sufficient Federal funds be allocated to care for this extra group of crippled children. Parents who have a custodial-type child need relief from the constant 24-hours-a-day care that is necessary. Where the family cannot afford to pay for the care, resources must be sought elsewhere. If a child can be placed in an institution, even on a temporary basis, he is given training to his fullest capacity in caring for his personal needs. This in itself relieves the family somewhat when he returns home.

We appreciate the opportunity of appearing before this subcommittee, and we hope that you will consider these problems seriously

and sympathetically.

Mr. Elliott. Thank you very much.

Are there any questions?

If not, at this juncture I want to recognize some of our friends who are visiting here today. I note Mr. Clyde Blackwood, superintendent of education of Blount County, is here.

Mr. Blackwood, would you stand?

Thank you, sir.

I note that Mr. Dwight Murfree, the principal of the Appalachian High School, is here.

We are happy to have you.

Mrs. Jewell Davis, the tax assessor in this county, is in our audience.

Former State Senator Allen is also present.

I also note Clarence Franklin and Benny Fine of Cordova, Ala. Let me say to all of you that we are happy to have you visit with us this morning.

Mr. Elliott. Our next witness is Mr. O. F. Wise, director, Rehabilitation and Crippled Children Division, Alabama State Depart-

ment of Education, Montgomery, Ala.

Mr. Wise is a long-time, able, and wise head of the vocational forces in this State, the vocational rehabilitation professional people. Just a year or two ago he was president of the American Vocational Association.

We are happy to have you, Mr. Wise, and look forward to your testimony.

I have noted that anything Mr. Wise does is always very thoroughly done. We are happy to have this privilege of hearing you.

STATEMENT OF O. F. WISE, DIRECTOR, DIVISION OF VOCATIONAL REHABLITATION AND CRIPPLED CHILDREN SERVICES, STATE OF ALABAMA, MONTGOMERY, ALA.

Mr. Wise. Thank you, Mr. Chairman.

Congressmen, needless to say, I am delighted not only to be here but to know that these hearings are going on in our State, in our Southland.

I believe historically our Southland has been rather vigorous in its efforts to promote the vocational rehabilitation of our disabled people.

I am pleased to have this opportunity to testify relating to rehabilitation aspects. As you mentioned, I am the director of the service for children and adults, and, therefore, we concern ourselves with the rehabilitation of children, even though it may not be vocational in nature but primarily physical restoration, as you just heard Mr. Bagley mention.

Today it is my purpose to speak primarily on the provisions of pending legislation as it relates to aspects of the program in Alabama. We have not only concerned ourselves with the physical rehabilitation of crippled children but the vocational rehabilitation program of

adults, including the blind.

I am here with the approval of the executive office of our State board, the State superintendent of education, and whatever I say

he has reviewed with me and is in accord.

We want to call particular attention to your bill H.R. 3465. We think that this bill and its Senate counterpart have been reviewed fairly well by lay leaders in our State who are interested in the rehabilitation of the disabled, top personnel of government and private agencies concerned with disabled people, as well as those of us who are within our own rehabilitation department.

I certainly approve the entire provisions of the bill H.R. 3465. We think that it rounds out the program of service to our State rehabilitation program, if enacted, in meeting the responsibility and providing service to all types of disabled people, including the severely disabled.

You will remember Mr. Benford's testimony relating to numbers. Not only did we have a backlog of known names of some 10,500 people on our rolls, but there are many others that are in a sense cataloged that we know of that we have not had the opportunity yet to see, and that group, as well as the 10,000 backlog, is what we are concerned with.

We have, as you may be aware, the responsibility for making the disability determination under agreement with the Bureau of Old Age Survivors Insurance. The section of the Social Security Act that made this provision provided that such applicants for disability deter-

mination would be referred for rehabilitation.

There are many thousands of those people that we have not been able to look into from the standpoint of evaluation to determine whether they could be vocationally rehabilitated or not. We have

agreements with our State welfare department whereby applicants for permanent and total disability benefits will be reviewed by vocational rehabilitation personnel for pensions during their application period. There are more than 12,000 recipients of this type under this

category of public assistance in Alabama.

We are not proposing what number could be rehabilitated out of this group, because we have no facilities whereby we could make the evaluation and determination. I am sure, if we did have those, without other additional facilities, we would be rendering whatever service we could render. I must say that many of them would be greatly improved to a point, and they may be able to take care of themselves. However, they would not be able to be fully vocationally rehabilitated as we refer to the clients of today, following services whereby they returned to remunerative employment.

Vocational rehabilitation and the State hospital for the mentally ill have worked out an agreement which provides for the patients of the hospital who may possibly be returned to society will be placed in foster homes, as patients of the hospital, on furlough. This is for

trial rehabilitation.

Procedures have been established to carry out the agreement, but

facilities are not available to meet the needs.

Our experience has indicated that community rehabilitation facilities can contribute greatly to the rehabilitation of these people. The State educational program has a fairly new, essential education program. Teacher allotments made by the department of education to local school systems are made for special classes. Working arrangements between the exceptional education and vocational rehabilitation provides for the upper-age group in these classes to be evaluated for possible rehabilitation potential. These classes are made up largely of mentally retarded, and reference has been made earlier to the large numbers that we have in this category.

The amount of active training that so many of these benefit from are soon exhausted. The next steps are adjustments to work and so forth, similar services which can best be furnished in established facilities

for that purpose.

There are vast numbers that we have actually had no inroads into, nor do we know what the number is. We have no normal agreements with groups relating to the cardiac, the arthritic, and others. We have formal arrangements or possibilities with hospitals for the tuberculars whereby those people can be returned.

But the answer is not a few more vocational rehabilitation counselors. We think that specialized facilities must be established with personnel capable of carrying out evaluation services at the first step.

So far in this State we have had some experience, as has been referred to earlier, with establishing some types of facilities. You heard of the establishment of the facility for the blind.

I could not resist it here, Mr. Elliott, giving or illustrating something with reference to the establishment of a workshop in your own hometown.

We had known for many years that rehabilitation facilities were needed which would include a rehabilitation workshop in Jasper or in that vicinity. This city is in the heart of the coal mining district, and the problems of rehabilitating large numbers of disabled miners

that we had known had been impossible.

In 1958 the local chapter of the Alabama Society for Crippled Children and Adults, along with another private organization, Industrial Missions, Inc., offered the first floor of a downtown building rent free for 5 years. The space was remodeled to meet the minimum requirements, and the rehabilitation center was opened about January 1, 1959. Some 10 or 12 severely disabled people can be served in this little facility at one time. The emphasis is on evaluation and training, However, some articles could be produced there by those who could work.

As fine as the gesture was on the part of the owner of the building, and as successful as is the small program that is being carried on at this time, it by no means meets the needs of the disabled in that area. Instead of making plans based on needs of the disabled, we were forced to plan for the best program possible with the space that was

available.

Under the provisions of the bills under consideration now, a district committee could have been set up, operating a program offered to the people, and no doubt a building could have been constructed to meet the needs of the severely disabled in the area. There is a strong possibility in my opinion yet that this will come about in the event that

the provisions of H.R. 3465 are met.

Another instance is in Montgomery. The local chapter of crippled children and adults and vocational rehabilitation joined together to form a workshop in an old warehouse building about 4 years ago. The facility today is in a very unsatisfactory location and in very poorly adapted space. The need for a larger workshop and facility for evaluation is urgent. The scope of the program could be increased to include the need of both physical and vocational evaluation service. This is a point where I feel that the three provisions of this proposed bill would have a common meeting ground: Your evaluation, facilities to carry out the evaluation as well as services, and at such times as those people will come before us that cannot be fully rehabilitated from the vocational standpoint, they can be returned to active, socially well-adjusted living, and people who can take care of their demands for daily living.

There are so many scopes of the program of dealing with disabilities that we could go into many aspects. However, I am sure that we will

have a wrap-up of this before the day is over.

I would like to close by saying that we certainly feel that your efforts are pointed in the right direction. We think that by removing some of the restrictions as to the people that we can accept for vocational evaluation, some of the restrictions that can be removed for community participation in making these facilities possible, will be a long step forward in our total problem, in our meeting the total problem of the disabled, as we view it, from a rehabilitation standpoint.

Thank you very much, sir.

Mr. Elliott. Thank you very much, Mr. Wise.

Are there any questions?

If not, let me say that I feel certain that your testimony will be very helpful to us in formulating legislation that this committee will soon consider.

(Mr. Wise's prepared statement follows:)

STATEMENT OF O. F. WISE, DIBECTOR, DIVISION OF VOCATIONAL REHABILITATION AND CRIPPLED CHILDREN SERVICES, STATE OF ALABAMA

Mr. Chairman and members of the committee, my name is O. F. Wise. I am pleased to have the opportunity to appear before this committee to give testimony relating to rehabilitation. I am director of vocational rehabilitation in the State Department of Education of Alabama. We have vocational rehabilitation services and services to crippled children within my division in Alabama. This provides for a concern for the rehabilitation of children, as well as adults. However, today my purpose is to speak of the vocational rehabilitation aspects of the program in Alabama, which, as you know, deals with adults who have physical and mental disabilities, including the blind. I am here with the approval of the executive officer of the board of education and will present the attitude of our State administration in connection with certain aspects of legislation under consideration. My statements are directed primarily to the provisions of H.R. 3465.

This bill and its Senate counterpart have been reviewed by lay leaders interested in the rehabilitation of the disabled, top personnel of some private and public agencies, other professional people, and those of us primarily concerned with rehabilitation in my own department. I certainly approve the entire provisions of the proposed legislation and I do not know of anyone who is in disagreement with me. It appears to us in Alabama that all provisions of H.R. 3465 are necessary to round out the program of services of the State vocational rehabilitation program in meeting its responsibilities in providing services to

all types of disabled people, including severely disabled individuals.

While I fully endorse all titles of these bills, it is my purpose first to talk specifically about title III, which relates to workshops and other rehabilitation facilities. The provisions of this title clearly relate to the provisions of title II relating to independent living services and title IV, which relates to improved evaluation services. We have had some experience in Alabama in developing rehabilitation workshops and facilities under a cooperative effort with public agencies and institutions and private nonprofit organizations. I think we know what these facilities can mean to severely disabled individuals, both for a proper evaluation of their condition and in providing effective treatment of their disabilities. In addition to this, we also use rehabilitation workshops as a means of employment while a disabled individual is in the process of preparation for competitive work or working for pay under a supervised situation on a continuing basis. We have worked with public trade schools in developing vocational evaluation facilities, with the university medical center and Mobile General Hospital in providing physical evaluation and treatment facilities, with the State institution for the deaf and blind in setting up adjustment and vocational training facilities and with local chapters of the Alabama Society for Crippled Children and Adults in establishing training and productive work centers. There is a cooperative development in Birmingham where a special workshop committee was set up. These developments have been on a very small scale with great limitations under present provisions of the law and in no way meet the total needs in providing rehabilitation services to severely handicapped individuals.

To best illustrate what title III of these bills will mean to Alabama, I will describe some specific workshap and facility developments and how they are failing to meet the need under Public Law 565, but with the provisions of these bills. I feel definitely that these workshops and facilities can make a greater

contribution to the needs of the disabled.

About 7 years ago our State rehabilitation program became very much concerned with some special disability groups that had been previously neglected in our rehabilitation effort; included in this group was epileptics. Our prime effort being to return these disabled people to employment, we soon found that all seizures could not be completely controlled for all epileptics. The epileptic league did not have extensive financing; therefore, we looked for an existing building that could be secured to carry on the program that had been jointly

outlined. There was an unused part of a building which was owned by the cripled children's clinic and hospital in which the local rehabilitation and crippled children's service offices were located. With the cooperation of the owners, some renovation was made and equipment installed. We were able to provide rehabilitation services in the facility to six or eight clients with epilepsy at any one time. Soon thereafter other disability groups were applying for services offered by this facility. A local committee was set up composed of interested citizens who helped in getting more adequate space to carry on the activities. We could not consider a new building no matter how desirable it might have been because of restrictions contained in Public Law 565, which state in brief that Federal funds are not available for construction of a building. Neither could the local group finance the construction of the building.

The only thing that saved us in this situation was the availability of an abandoned workshop for the blind that was under the trusteeship of the community chest in Birmingham. The workshop board, the coordinating council of social agencies, the community chest, as well as vocational rehabilitation personnel, joined together in renovating and adapting the space for workshop and facility purposes. It is proving a wonderful asset toward the rehabilitation of the blind and severely disabled in this community. However, it is inadequate and if provisions of these bills become law, there is every reason to believe that the additional facilities that are so urgently needed in Birmingham can be developed.

In Montgomery the local chapters of the society for crippled children and adults and the vocational rehabilitation program joined together in establishing a small workshop in an old warehouse building about 4 years ago. The facility today is in its third unsatisfactory location and in poorly adapted space. It is a spendid program, but it is in a position to serve only a few people. The need for a large workshop facility and work evaluation program is urgent. The scope of the program should be increased to include the need for both physical and vocational evaluation services. This is a point whereby provisions of titles III and IV of H.R. 3465 would become closely related. The local society and other community group interests can be pooled to provide matching funds under the provisions of these bills and make possible much needed services to the disabled in this area. It is impossible to expect that the community will be able to take the responsibility for the entire cost of constructing a building.

The State society for crippled children and adults has established a Montgomery Area Rehabilitation Committee looking toward the possibility of establishing a physical and vocational rehabilitation facility in Montgomery. This private agency has been given 3 acres of land adjoining a proposed Baptist Hospital site. At this time about \$100,000 has been raised. The schematic drawings of their facility indicates a \$600,000 investment. Provisions of these bills will make it possible for this much needed rehabilitation facility to become a reality at an early date. Without these provisions, we can expect to wait many

years before such development becomes possible, if at all,

In Jasper, Ala., we have known for many years that a rehabilitation facility was needed which would include a rehabilitation workshop. This city is in the heart of the coal mining district and the problem of rehabilitating the large number of disabled miners that we know has been impossible. In 1958 the local chapter of the society for crippled children and adults along with another private organization, Industrial Missions, Inc., offered the first floor of a downtown building rent free for 5 years. The space was remodeled to meet the minimum requirements and the rehabilitation center was opened about January 1, 1959. Some 10 or 12 severely disabled people can be served at one time. The emphasis is on evaluation and training; however, some articles are produced for which the disabled workers are paid.

As fine as the gesture was on the part of the owner of the building and as successful as is the small program that is being carried on at this time, it by no means meets the needs of the disabled in the Jasper area. Instead of making plans based on needs of the disabled, we were forced to plan for the best program possible with the space available. Under the provisions of these bills, a district committee could have been set up, a capital outlay program offered to the people, and a building could have been constructed to meet the needs of the severely disabled in this area. There is a strong possibility that this can yet come about if these bills are enacted with the workship and rehabilitation provi-

sions set forth in title III.

We have joined with many community groups in developing workshops and other facilities and have found that securing space and equipment have presented problems, but the greatest problem we have had to face has been providing initial staff. I, therefore, feel that provisions should be made for payment of initial staff as these bills would do. We have tried out initial staffing on a 1-year basis as provided for in Public Law 565, in establishing facilities, and found it inadequate. Certainly vocational rehabilitation funds for initial staffing should be available over a longer period of time; the 2-year provision of these bills should meet the need.

In order to provide rehabilitation services to the vast number of disabled people who are known to our vocational rehabilitation agency, many more rehabilitation facilities are needed. The types of rehabilitation facilities needed include comprehensive centers, sheltered workshops, halfway houses, occupational centers for the mentally retarded and emotionally disturbed, and a number of variations

of all of these.

In Alabama we have had thousands of referrals from the Bureau of Old-Age and Survivors Insurance as a result of amendments to the Social Security Act. These referrals, made in connection with the disability determinations program carried out by the State vocational rehibilitation agency, are required by law.

We have an agreement with our State welfare agency whereby applicants for permanent and total disability benefits will be reviewed for vocational rehabilitation potential in connection with their application for public assistance. There are more than 12,000 recipients under this category of public assistance in Ala-

bama at the present time.

Vocational rehabilitation and the State hospital for the mentally ill have a working agreement which provides for patients of the hospital who may possibly be returned to society through vocational rehabilitation, to be placed in foster homes as patients of the hospital on furlough, for trial in rehabilitation. Procedures have been established to carry out the agreement; facilities are not available to meet these needs. Our experience indicates that community rehabilitation facilities and workshops can contribute greatly to the rehabilitation of these mentally ill people.

The State educational program has a fairly new exceptional education program. Teacher unit allotments are made by the department of education to the local school system for special classes. A working arrangement between the exceptional education unit and vocational rehabilitation provides for the upper aged youth of these classes to be evaluated for possibly rehabilitation potential. The classes are made up largely of the mentally retarded. The amount of academic training from which they can benefit is soon exhausted. The next step is occupational tryouts, adjustment to work situations, and similar services which

can be best furnished in rehabilitation workshops and facilities.

There are vast numbers of disabled groups for whom we have no formal procedure in handling. This includes the large number of people who have cardiac conditions and those with arthritis.

A more formal working arrangement should be established with the hospitals for the tuberculous whereby rehabilitation facilities could be established for the patient to regain work tolerance and habits as he regains his health.

I would like to conclude my statement by saying that the establishment of a rehabilitation workshop and other facilities is a necessary adjunct in carrying out good vocational diagnostic procedures with large numbers of disabled people with extraordinary problems. Rehabilitation facilities should be developed to provide clinical findings and the therapies required in returning chronically ill patients to an independent living status. They should further be developed as a reasonable way in which vocational adjustment, prevocational and vocational training can be offered and to provide limited work for pay to those who might be expected to require supervised and sheltered conditions for their livelihood.

Mr. Elliott. I notice that Dr. M. S. Whiteside, of Cullman, is in our audience.

Thank you for coming, Dr. Whiteside.

Our next witness this morning is Mrs. Alpha Brown, consultant, program for exceptional children, Alabama State Department of Education, Montgomery, Ala.

STATEMENT OF MRS. ALPHA BROWN, CONSULTANT, PROGRAM FOR EXCEPTIONAL CHILDREN, ALABAMA STATE DEPARTMENT OF EDUCATION, MONTGOMERY, ALA.

Mrs. Brown. Mr. Chairman and members of the committee, I certainly appreciate your interest in this program and the opportunity

to present our needs to you.

I wish, first of all, to say that I am interested in the education of all children, but I do feel that we should provide the specialized additional program which is needed to aid pupils to become selfrespecting, self-supporting, socially responsible, and informed adult

citizens despite a handicap or exceptional condition.

The State superintendent of education, the State board of education, and the State Committee on the Education of Exceptional Children are very interested in this program and are giving time and energy in helping to promote, plan, and develop a good program of special education in our State. Many organizations and groups have worked cooperatively toward this goal. A variety of problems and

needs have been encountered.

Let us consider, first, the number of exceptional children. Most estimates give 10-12 children out of every 100 in need of some special service and special educational program. In Alabama, services are being provided in a limited way for roughly 6 percent of the estimated exceptional children. Therefore, one of our long-range needs is to provide services to these exceptional children who are not receiving any. Many additional classes will be needed to provide services, facilities, and educational programs for the exceptional children

To meet the needs of these children in this program now and in the future, adequately trained personnel is needed. This trained personnel should include classroom teachers; principals; superintendents with inservice training; supervisors in the various areas of disability; physical, occupational, and speech therapists: nurses; medical social workers; guidance personnel; and vocational rehabilitation counselors. There is a critical shortage of personnel in all of these categories.

The teacher shortage is critical in all areas of special education. In Alabama, some of our teachers working in special classes have no special training. The extent of training with the other teachers ranges from 2 hours to a master's degree in special education, with

very few teachers in the upper level of training.

A chart is attached giving hours of training.

Mrs. Brown. Through training we feel that the teacher will better understand (1) the child's problem; (2) what his educational program should be; (3) how to guide and present the program; and (4) the expected outcomes of each specific program for each special type of handicapping and exceptional condition. A particular effort must be made to provide an appropriate program for each pupil enrolled in each class. It is realized by all that specialized services cannot be provided with nonspecialized personnel.

We must not permit these special classes to become places where children who do not fit in the regular classroom are stationed. There must be a particular reason for establishing each class, each facility, each service, each piece of equipment, and special instructional materials. Exceptional children should be placed in a program designed and equipped to cope with their specific type of dis-

ability.

The placement of a pupil in a program not planned for one in his condition might be harmful to him and also prevent all the other pupils from progressing as they should. Therefore, attention must be called to the vital need for well-trained personnel who do the screening, diagnosing, and evaluation of these pupils which determine their eligibility for special services and special classes.

Again, there is an enormous shortage of school psychologists, psychiatrists, medical social workers, and others who play an important

part in this phase of the program.

More staff is needed at the State level. With 300 units, 1 person cannot adequately meet the needs of the program. Supervisors in the various areas of exceptionality are needed at the local level to assist teachers on the job with their problems.

No school system in Alabama employs a supervisor of special education or a physical or occupational therapist. A limited number of speech therapists are employed. There are two reasons for this:

Lack of funds and lack of available personnel.

Special attention should be directed to children of high school age. Many drop out here. Some dropouts are due to severe emotional upsets which frequently occur during the adolescent years because of lack of social acceptance and limitations in the ability to participate in the activities of this age group.

Also, the program must be planned to bridge the gap between special classes and job placement. The rehabilitation and crippled children's service and special education work very closely together in Alabama. This service gives us all the help they can, but limited

personnel prevents sufficient help in these areas.

All children need guidance, and particularly do the exceptional children. Guidance, to be effective, is a continuous process that starts when the child first enters school and does not stop until the day he leaves school. In many instances it may follow for a time after he leaves school.

The function of guidance is to help the child understand himself in relation to his needs and the demands of his environment so that he may live as full and effective a life as possible today as well as

in the future.

Many people will be involved in the guidance of exceptional children. In working with these children, all of the services for normal children are needed plus services for the additional problems in-

volved in the exceptionality.

These children must be helped in accepting their limitations, to be realistic about their vocational potentials. They must be given help in securing social acceptance. The people responsible for guidance of exceptional children should provide them with necessary information concerning occupational, social, and general environmental requirements. Parents must be given help in accepting their handicapped child and the limitations involved, to be realistic about what can be done for him and what he can ultimately attain. Help should be given if the parents are overprotecting or rejecting the child. Again, trained personnel is needed in this field.

HOUSING NEEDS

Many communities attempt to operate special classes or provide special services in inadequate buildings or quarters not designed for school purposes. In addition, many communities are presently planning and building new school plants without giving consideration to facilities for the education of exceptional children. Special education needs, both present and future, should be considered before building. The facilities for special education should be neither better nor worse than those provided for the regular program. However, there are some facilities and some special equipment that must be provided if the objectives of the program are to be accomplished. What is needed will depent upon the specific type of exceptionality to be served and upon the background of the teacher, therapist, and other personnel working with the children.

Funds for transportation are needed. Numbers of exceptional children in rural areas are denied the needed training and services due to lack of transportation to bring them into centers where programs are available. More transportation is needed to take children

to and from treatment centers.

Our law has been judged as outstanding by specialists in this field throughout the country. It is liberal and flexible in every respect and makes it possible for the State board of education to work with local boards of education in providing many of the services needed by exceptional children and youth. Not enough financial support is provided at the present time to develop all of the facets of the program in a satisfactory manner. We hope that our program will be such that, through special education, most of our children will be employed instead of standing in the line of the nonemployed and the unemployable.

We feel that the Federal Government could assist in this progrant by (1) providing funds for the training of needed personnel by increasing the benefits under Public Law 85-926. Presently there are five requests on my desk. Little publicity has been given to it due to the fact that Alabama's goal is filled. In providing funds for the training of needed personnel, the Federal Government could assist:

(1) By providing a training program for all personnel working with exceptional children similar to that now being provided for teachers in the field of guidance, science, mathematics, and modern

foreign languages.

(2) By providing financial assistance to the various institutions involved in these training programs.

(3) By providing additional funds for transportation.
(4) By providing additional funds for equipment.
(5) By providing additional funds for improvement of facilities. (6) By providing additional funds for instructional materials.

With this help, I believe the program of special education would move forward soundly and effectively.

Mr. Elliott. Mrs. Green desires to ask you a question.

Mrs. Green. Mrs. Brown, for a day and a half we have heard witnesses testify as to the needs of more personnel, more adequately trained personnel, and the lack of funds. Here in Alabama, have you given real consideration to how much you would actually need if you were to undertake an adequate program, how many personnel you now have, and how many you would really need if you did the iob?

Mrs. Brown. I think that would be a longtime plan. We would have to plan a few additional units each year. We should go back and train these teachers who do not have adequate training that are work-

ing with us now.

We have 305 classes now for exceptional children, and I believe there are 170 white teachers that lack any training. I believe there are about 20 Negro teachers that lack training. The chart on my statement refers to that.

Mrs. Green. Have you made any estimate of how much money it

would take in this one State?

Mrs. Brown. No.

Mrs. Green. This is the thing that runs through my mind: We hear over and over that we must have more personnel, we must have more funds. First of all, do you have funds for the normal children?

Mrs. Brown. Yes.

Mrs. Green. Do you have a program that you consider adequate for all of the normal children in Alabama?

Mrs. Brown. Our teachers are not adequately trained in the normal field. We have many teachers working with our regular children that are not adequately trained in Alabama.

Mrs. Green. How are you going to get more teachers?

Mrs. Brown. I think we are going to have to begin a recruitment program. Probably at the last year in high school we will let the people know about these children, let them observe some of our special classes, and let them know in their early college training, to let them know about the program; do something in the way of orientation, and try to recruit more teachers to take this training.

We do have regular teachers who are interested in this field, and

we could urge them to take more training.

Mrs. Green. This sounds good.

Yesterday one gentleman testified that the maximum salary that a psychiatric social worker, which would be up on the scale, could expect after years of service was \$6,200. I believe that was the testi-

mony.

This person that is graduating from high school and going into college looks at the bricklayer, either here or in some other place, who makes more than this. How are you going to recruit the personnel to do the dedicated and inspired task of working with the exceptional children?

Mrs. Brown. There are some people who really want to do that. Sometimes there is a parental background where they encourage them

to go into teaching.

I think one way we could do it is to raise the salaries of teachers. That might bring them in. I think that is one thing. We all think of economic security, and we want that future for ourselves. But I think we are improving in that area.

I could not tell you, though, how much it would take. It is a difficult job. We are so short of teachers; but that is why. We have not been able to get them into the program. I think part of it has been

due to the lack of financial security.

Mr. Daniels. When you say financial security do you mean lack of adequate salary?

Mrs. Brown. Yes.

Mrs. Brown. Yes.
Mr. Daniels. Does the the State of Alabama have a minimum

salary for teachers?

Mrs. Brown. The State makes a salary allotment due to training,

and then each system sets up its own salary scale.

Mr. Daniels. When you say due to training do you mean having a degree?

Mrs. Brown. That is right.

Mr. Daniels. Is the ceiling placed on a salary of a teacher having

any of those degrees?

Mrs. Brown. Not with a local system. The State department allocates according to training, and each school system may set up a salary scale they feel they can support.

Mr. Daniels. Therefore, from one county or parish to another the salary may differ?

Mrs. Brown. That is right.

Mrs. Green. How much is the State allotment?

Mrs. Brown. It ranges from \$4,200, the salary for a master's degree.

Mrs. Green. That the State provides? Mrs. Brown. The State allots that much.

Mrs. Green. How much do they provide of the \$4,200?

Mrs. Brown. For a master's degree they would allocate \$4,200? Mrs. Green. And then the local district would add to that?

Mrs. Brown. They could add more if they wanted to. Some of our

cities add \$300 or \$400 a year to that.

Mr. Giaimo. You spoke of the shortage of personnel and the need for Federal funds. Is the State of Alabama or any of the States with which you are familiar doing anything to get additional funds

into this program?

Mrs. Brown. Each year there is an effort made with the legislature to do that. We did get quite an increase in appropriations this year, but there is danger of a proration because some of the money allocated for education may not come in in the amount that it was allotted for.

Mr. Giaimo. So that up until this time at least there has not been an

increase in the amount of appropriations?

Mrs. Brown. Yes, each 2 years we have had some increase.

Mr. Giaimo. Has it been adequate?

Mrs. Brown. No.

Mr. Giaimo. Is the problem, then, the shortage of local funds or

State funds?

Mrs. Brown. Well, we need both at both levels. It seems that our State provides more from the State level than other States, than many other States. So we need both more from the State level and from the local level. But that is going to be a problem of education and of getting people, the public in general, more interested in going along with better salaries for teachers.

Mr. Giamo. Along the lines of getting the public interested, I think that is one of the big problems in this whole field of the handicapped, to get more public awareness. At such time as we do I think we will

have progressed a great deal toward solving this problem.

Have you noticed any increase in Alabama in public awareness of

this problem?

Mr. Brown. In some areas I would say so. I mean in some communities. And in others I would say not. But where we have a real good teacher or teachers, they usually sell the program. They are one of the best agents we have for selling the program, a good special education class doing more to sell the program than anything else that can be done.

Mr. Giaimo. That is true, but that is usually the exceptional case,

is it not, or unusual?

Mrs. Brown. Of course, many of our teachers do not have the ability to sell the class.

Again, I think if they were trained, they would do a better job in selling the class.

Mr. Giaimo. One of the concerns that I have had in the northeastern States has been a lack, I think, of public awarness, or of sufficient public awareness.

Mrs. Brown. It is a lack of understanding of the program. I think

that is one of our major problems.

In the first place, in Alabama it is a new program. I think that is partly it. They ask me, "What are you going to do with these children when you get them in your special class? What is the ultimate

outcome?"

I think that is a good question from the lay person. We have to work towards that. I think there are many ways we could do that: Through appearing before civic clubs; through using some of the few films available, and through having newspaper publicity. That is a job that really needs to be done here, and, I think, maybe, in other States, too.

Mr. Giaimo. But has a start been made toward doing that?

Mrs. Brown. Yes. Our PTA, our State PTA is very interested in this program, and on their two regional programs they have had the program for exceptional children.

Many civic clubs are asking various people to come in and discuss this program. So I think there is an increasing awarness. But, still,

it is not at all complete.

Mr. Giaimo. You do not feel that this is unique to any one State?

Mrs. Brown. No, I do not.

Mr. Giaimo. I agree with you. I think it is universally so through-

out the country.

Mrs. Green. You mentioned some inservice training. If I understood you correctly, you suggested inservice training for principals and supervisors.

Mrs. Brown. Yes.

Mrs. Green. Is there such a program?
Mrs. Brown. There are many inservice training programs in Alabama. A few of the systems include a program dealing with the program for exceptional children. But so often it is only that we have one or two teachers in a system for this program and there are not enough for a group.

But there are some inservice programs this year where teachers have asked various people to come in and serve as consultants to a group of regular teachers on how to work with the exceptional child in their classroom, which I think is a good chance for some inservice pro-

Then I think we need really to work with superintendents and principals. I think they need an inservice type of training. After all, they

are going to provide the main leadership in this program.

If a principal is not for the program it is not very wise to put a class in his building. Too, some of the regular teachers even do not understand this program. So we have a big job of educating the public in this program in our State.

Mr. Elliott. Thank you very much.

I want to recognize the presence of Mr. Owen Williams, the chairman of the Republican Party of Cullman County. Also I recognize Mr. Newt Rains, who tells me that he will be a candidate for one of Alabama's delegates to the National Democratic Convention.

I also want to recognize G. S. Smith, a former assistant superintendent of education of this county, and a former superintendent of education of Lamar County, another county of our district.

Mr. Smith, we are happy to have you, sir.

I also recognize Mr. Thurmond Guthrie, the veterans' service officer for Cullman County. And Mr. Bryce Davis, a former member of

the legislature of this county.

I had thought by this time that we would have a recess. However, while we wait a few minutes for the time to arrive, we will ask Mr. Craig Mills, assistant director of the Division of Vocational Rehabilitation of the Florida State Department of Education, to proceed.

STATEMENT OF CRAIG MILLS, ASSISTANT DIRECTOR, DIVISION OF VOCATIONAL REHABILITATION, FLORIDA STATE DEPARTMENT OF EDUCATION, TALLAHASSEE, FLA.

Mr. Mills. I am Craig Mills, assistant director of vocational administration in the State of Florida. I represent Mr. Claude M. Andrews, the director of vocational rehabilitation in Florida, who was invited to appear. Unfortunately, he had previously made commitments which have kept him from being here, and he has asked me to attend in his place.

We wish to express our appreciation to you and to the committee for this opportunity. I also bring the greetings of Superintendent

Thomas N. Bailey of the department of education in Florida.

As we sat through the hearings yesterday and today, and as we enjoyed the opportunity to participate in the workshop in Atlanta on Monday and Tuesday, we heard a recurring theme of needs for personnel, facilities, training facilities, workshop facilities, and the need

for research.

I think I can echo that our needs in Florida are similar to those expressed, and it is with some awe that we realize that so many of the things brought out in the study in the workshop on Monday and Tuesday were things that had already been provided for in some measure in H.R. 3465. This brings to our attention the fact that considerable foresight went into the preparation of that bill, and we would like to join those who have already testified in endorsing the provisions of H.R. 3465.

There are a few things that I think I might add that have not previously been brought out in testimony which would be of some signifi-

cance to you.

As we have heard these accounts of needs one could almost become discouraged by the overwhelming task that seems to be before us in the field of disability, and with the relatively few resources which appear to be ours in the handling of this job. In doing this we would not want to leave the impression with you that the tools and the resources which have been given to us have not been effectively used, or that they have not been helpful. For instance, we have gained much from provisions in Public Law 565 under which we now operate in vocational rehabilitation, which are somewhat similar and are at least in harmony with many of the provisions contained in H.R. 3465. For instance, we have gained greatly by research and demonstration projects. We have gained greatly in our State by additions to facilities.

The inservice training program made possible under that law has been a substantial contribution to our staff. We have been aided greatly by orientation training, supervisory training, short-term programs on the fitting of prosthetic appliances, working with the deaf and hard of hearing. We have benefited vastly by the counselor training pro-

gram which was instituted pursuant to that law.

Here in the southeastern region we have two such regional training programs, one of which is at the University of Florida, and one of which is at Vanderbilt University. We now have our own staff in Florida, 11 men who came from the training program set up pursuant to that law. This has been a tremendous boost to us in thoroughly training competent individuals who have been able to come on our staff without having to go through long periods of intensive inservice training, without having to consume the staff time of our trained staff members, and who have been able to get into production in a relatively short time.

We feel that the success shown in this type of provision under Public Law 565 bodes well for the future of the things recommended in H.R. 3465, and we commend to you and to the Congress the passage of this law.

I feel I should tell you that we feel our greatest need is still in the

area of funds for facilities and diagnosis and evaluation.

Mr. Wise has testified to you on the impact of the working relationship that we have with social security and the Bureau of Old Age and Survivors Insurance. Through this relationship we have uncovered many thousands of disabled adults who have multiple, chronic disabling problems, who will require intensive evaluation and thorough appraisal. We have a real need in this area.

There are one or two other things in connection with provisions of H.R. 3465 which perhaps have not been emphasized in the past 2 days

which I would like to bring to your attention.

We sometimes hear disparaging remarks being made regarding Federal interference. I want to tell you that, so far as we are concerned in Florida, we feel that the working relationship between the State division of vocational rehabilitation and the Federal Office of Vocational Rehabilitation is a model. We have received every cooperation and assistance possible from the Federal Office, and we feel that it is only right and reasonable that H.R. 3465 contain a provision asking for the administration of the independent living provisions through the Federal Office of Vocational Rehabilitation.

We feel also that it might be important to tell you that there is a readiness on the part of our State and many States to get into this new phase of work. We feel that there is an expression of opinion already in our State that vocational rehabilitation should handle this work and should be permitted to do rehabilitation for independent living. I believe it was brought out to you in testimony yesterday by Mr. Miller that Florida had already passed an independent living bill

somewhat similar to H.R. 3465.

It has been reported unofficially that approximately 14 States in the country have such bills. While this would indicate a readiness on the part of the States, I think we should recognize also that there is a time lag, or will be a time lag following the passage of Federal legislation during which certain other States will have to propose amendments to their State laws, or propose the enactment of enabling State legislation to permit them to take advantage of the Federal provisions.

For this reason it seems to us that our job in the passage of H.R. 3465 is even more urgent than ever before and makes it most im-

portant that it receive consideration this year.

We want to express our appreciation to you and to your committee for these long-range studies that have been made, for the opportunity to testify in behalf of this bill, and to urge that all possible action be taken on it in the Congress this year. We would also at the same time like to pledge you our support in being of assistance in any way that we can in accomplishing this task.

Thank you very much for this opportunity to be with you today.

Mr. Elliott. Thank you, Mr. Mills.

Mrs. Green.

Mrs. Green. Do you see any advantages or disadvantages to having the rehabilitation for the blind a part of the vocational rehabilitation program in the State?

Mr. Mills. I forgot to mention that.

In Florida, of course, rehabilitation for the blind is handled by a separate division, the Florida Council for the Blind. Our regular vocational rehabilitation program does not handle vocational rehabilitation for the blind.

We feel that in our State at least this is a distinct advantage. They have specially trained people in this capacity, and they do a most ef-

fective job.

In those States were rehabilitation for the blind, as well as rehabilitation for other disabilities, have traditionally been handled by one agency, I am not so sure there would be the same advantages accruing if the separation of functions were made now.

Mrs. Green. What are the reasons for having a separate agency

for the blind that would not hold for all the other areas

Mr. Mills. In those areas where considerable training has been given to general rehabilitation personnel I think there would be some loss of past training effort, if a separation were now made. The avenue is of contact in local communities: the supervision procedures, the administrative procedures, might suffer some loss of motion and some loss of effectiveness in service, at least while the separation was being made. After a long-run period perhaps it would be more effective. This would be purely speculative on my part.

Mrs. Green. Is there more reason for having a special agency for

the blind than for the deaf?

Mr. Mills. Yes, I think there is.

People who work with the deaf closely might well present the argument that the problem of communication with the totally deaf would make even more reason for special work with a special agency or

special workers with the deaf.

Since we do not have a special agency for work with the deaf, our men have generally been trained to work with the deaf and with the hard of hearing, and, while I feel that any agency which is doing work of this type would benefit by having some specialists on their staff who are well equipped to communicate with the totally deaf and who could act as consultants to counselors, there generally would be

no tremendous advantage in having an exclusive agency for the work with the deaf alone.

Mrs. Green. Thank you.

Mr. Elliott. Thank you very much, Mr. Mills. Dr. Stanley Ainsworth was to be our next witness, and he has written me a letter expressing the reason for his inability to attend.

Without objection, I will make Dr. Ainsworth's statement a part of the record. I might say that Dr. Ainsworth was with us yester-day and testified in another connection.

(The statement referred to follows:)

STATEMENT BY STANLEY AINSWORTH, PH. D., PROFESSOR OF SPEECH CORRECTION AND CHAIRMAN, PROGRAM FOR EXCEPTIONAL CHILDREN, UNIVERSITY OF GEORGIA. ATHENS, GA.; PRESIDENT, AMERICAN SPEECH AND HEARING ASSOCIATION

Mr. Elliott and members of the subcommittee, in presenting testimony to you concerning House Joint Resolution 494, I am doing so in several capacities. I have been active in the field of speech and hearing disorders for more than 20 years with an additional 5 years of general teaching. This experience has included public school teaching, public school speech therapy, clinical services for a crippled children's home, and activities in several university speech and hearing clinics. My duties have included advisory and consultant services to community speech and hearing clinics and rehabilitation centers, State and county programs, colleges, State departments of health, education, and vocational rehabilitation, the U.S. Office of Education and the U.S. Office of Vocational Rehabilitation. For the past 16 years, I have been training speech and hearing personnel and have assisted in the establishment of new training programs in three universities. My present work is concerned with the direction of a training program for speech correctionists and teachers of the mentally retarded and of the physically handicapped. Also, as president of the American Speech and Hearing Association, I shall try to represent the thinking of this whole profes-

sion as well as possible.

Before any comments about House Joint Resolution 494 can be made, it is important to present the context within which these opinions will be given. Any legislation which is designed to assist those with speech and hearing disorders must take into consideration the complexity of the professional field which is concerned with these handicaps. For instance, the professional people in this field offer a wide range of remedial and therapeutic services which have outlets in many job situations. These working situations differ in their emphasis and primary goals. A great many clinicians are found in public schools where the emphasis is on alleviating communication disorders as a vital contribution to the total education process; many others function in medically oriented centers concerned with the physical and mental rehabilitation of the individual. In this latter situation the clinician contributes to the communicative aspects of this rehabilitation. Other clinicians function in settings which have neither a medical nor an educational emphasis but concentrate on the communicative disorders apart from any other professional or institutional emphasis. Still others serve in supervisory and consultant capacities in State, county, and city departments of education and health. Other clinicians may engage in private practice. In the process of helping individuals of all ages, from preschool to old age, the speech pathologists and audiologists not only apply distinctive diagnostic and therapeutic procedures but must relate effectively to many other therapeutic, educational, and professional disciplines in such a way as to bring about an effective improvement of the individual's communication. The specific nature of the disorder may vary considerably depending upon the type of problem, the age of the individual and his particular personal, social, and economic needs. It should be stressed that whatever an individual needs in regard to his communicative disorders, the changes that take place in him when he improves are the same regardless of the clinical setting within which he receives. this treatment. Furthermore, the basic training for all clinicians is the same. Those who wish to work in certain job situations or at particular levels of professional activity should, of course, take additional training to equip themselves appropriately.

If we are to serve these individuals effectively and efficiently, we must encourage outlets for clinical services in as many job settings as possible. If this is not done there will be serious gaps in the help for different age levels and for some types of problems. A limitation of services to one type of clinical facility—such as educational, medical, rehabilitation or any similar designations—would prevent services to the other areas which are equally concerned with restoring the handicapped person to his highest level of personal, social, and economic potential.

There are some types of problems which are related to certain physical and psychological deviations but even these contain unique characteristics involving communication; there are other types of problems which are not specifically related to anomalies other than those within the area of communication itself. The procedures in diagnosing and treating all these individuals involve principles of learning but the speech and hearing clinicians does not function as the classroom teacher who is concerned with classrooms of children, academic content and skills, and general social adjustment. And although the speech and hearing clinician is concerned with "readjustment" of the individual, the necessity for focusing on all aspects of oral communication makes this work distinctly separate from the profession of clinical psychology. Those close relationship to principles of learning and the communicative readjustment of the individual demonstrates that the diagnosis and therapy conducted by the speech pathologist and audiologist are not primarily medical. Therefore, the speech pathologist and audiologist is most appropriately viewed as a member of an independent profession who provides diagnosis and remedial services in many settings. It is true, of course, basic research and understanding of certain of these communicative problems may involve many of the basic sciences and of psychology, medicine, sociology and rehabilitation, etc.

The kinds of complexities briefly outlined above increase the difficulty of providing legislation which will satisfy all levels and all areas of needs in this field. Any such legislation must be constructed in such a fashion as to retain the professional independence of speech pathologists and audiologists. It should not limit support of the field or imply restrictions of function to any one field such as education, medicine, psychology, or rehabilitation. The speech pathologist and audiologist relates to and contributes to all of these areas as well as provid-

ing services which are unique and independent of these areas.

These comments have not stressed the many and diverse needs in the field. I am sure that these have been covered amply by the people you have heard in your hearings these past 2 days as well as in materials which have been provided you previously. There is little question that the most critical needs involve the provision of adequate and sufficient personnel. Any attempt to meet this demand must involve some kind of assistance (1) for the students wishing to become speech and hearing clinicians, and (2) for the improvement and expansion of training programs. If the profession as a whole is to meet its responsibilities to the handicapped, it is obligated to support any legislation which will improve the quality and increase the number of personnel in the field and which will allow the members of the profession to retain their professional identity and independence as speech pathologists and audiologists.

House Joint Resolution 494 is a bill which aims directly at increasing and improving personnel and training programs. Therefore, the American Speech and Hearing Association has officially endorsed this bill. We believe that its passage would assist significantly in attracting more individuals into this field and in improving the quality and number of our training programs. It is true that this single bill does not attempt to meet all of the urgent needs in the field of speech and hearing disorders. It is doubtful if any omnibus bill would be provided which would supply the variety of support needed in this complex field which cuts across and participates with so many professions. Therefore, I would like to urge that this bill be supported as an important step in relieving the personal tragedies and incapacities resulting from speech and hearing disorders.

On behalf of the entire profession of speech and hearing. I wish to express my deep appreciation for giving me the opportunity to present this testimony.

Mr. Elliott. Our next witness is Mrs. J. C. McMeen, southeastern director, National Association of Retarded Children, Columbia, S.C.

STATEMENT OF MRS. J. C. McMEEN, SOUTHEASTERN DIRECTOR, NATIONAL ASSOCIATION OF RETARDED CHILDREN, COLUMBIA, S.C.

Mrs. McMeen. I dislike reading a paper, but, being a woman, I

knew I could never condense it in the time allowed.

Mr. Chairman and distinguished members of this committee, having listened to the many qualified professional people testifying during this hearing, I consider it a real privilege to be allowed to speak on behalf of the mentally retarded and their families.

Not being a professional person, perhaps I should just file my own request to appear as an interested citizen before this important committee, and explain my particular interest in the field of mental retardation, a subject that is very near and very dear to my own heart.

I am the mother of a cerebral-palsy retarded child, and have had the pleasure of working in a voluntary capacity for the associations for retarded children on local, State, and National levels for the past

7 years.

When, during the workshop in Atlanta, parent groups were referred to as pressure groups, I had to stop and thank God that my own child was born during this era when so many parents of retarded children have finally stopped burying their heads in the sand and have stopped hiding their retarded children in back rooms, and are now seeking help for these forgotten children who have so long been neglected.

Much progress has been made in the field of mental retardation, particularly since the inception of the National Association for Retarded Children just 10 years ago. Yet we have barely scratched the surface in some areas in our attempts to help all of the mentally

retarded.

As chairman of the national association's membership committee, I am proud to advise this committee that we now have over 700 units that are members of our national association. We are presently working with units all over our 50 States, the Territories, and with military

installations overseas.

I wish that I could come before this committee today and simply request of it an appropriation to purchase a magic wand to wave over all the mentally retarded, to completely eliminate this tragic and heartbreaking condition that affects so many, some 5 million children and adults in our Nation. However, since there are still some things that money cannot buy, I would like to take this opportunity to thank you for the interest you have already shown toward helping the retarded to have the chance for a happy life, and the opportunity for learning that is supposed to be the right of every child.

Mr. Elliott. Do you approve the bill that we passed a couple of years ago to provide training for teachers of the mentally retarded?

Mrs. McMeen. We certainly do. It has been a big help.

Mr. Elliott. It is proving to be a real help, and will prove to be a real help, will it not?

Mrs. McMeen. We find it very good; yes.

With the mentally retarded rehabilitation or, rather, habilitation begins from the moment that parents know their child is retarded. Through early identification and evaluation, and with the proper

planning and coordination of services for our retardates we can expect higher performance on their part, leading to less dependency, thereby saving many tax dollars.

There is still a crying need for more and better diagnostic evaluation and followup service centers. Many of the ones we already have

are restricted to certain age groups.

There is also a tremendous need for parent counseling, nursery and all-day care centers, more special classes both for the trainable and educable children, prevocational shops, sheltered workshops, recreational and religious, improved and expanded residential centers, and, last but not least, more research into the causes, prevention and possible cures for mental retardation. Each of these needs points up an even greater need for more extensive training for both the professional and nonprofessionals.

Times are changing for the retardate. They now have an increased life expectancy due to the many miracle drugs and with the improved and continued treatment, care and training programs. So now we must plan more and more for the retardates as they grow older.

In years past, when we had more rural living, many of the retardates could live under the sheltered conditions offered on our farms, but now, as we have and are becoming more industrialized and urban, our retardates go wanting for the lack of these protective environs and the lack of preparation and training to fit into the changing world.

The changes make us cognizant of the fact that we have asked for too little and too late, and make us realize the high cost of cheapness. We are filling our State institutions and residential centers way beyond the capacity which they were planned to accommodate, there-

by spending more tax dollars.

I would say that it costs between \$300 to \$600 per year to send a child to school for education and training whereas it costs approximately \$1,200 to \$1,500 per year to keep a child in an institution.

From my personal observation in visiting schools and institutions in a dozen or more States, I have become aware of this high cost of cheapness, for I see magnificant buildings erected as institutions for the mentally retarded, beautiful but poorly planned because of the lack of insight into the real needs of these handicapped individuals, when more thought should have been given to "brains instead of bricks."

Adequate but less expensive buildings could have been built which would not have subjected the institutions and the residents there to the short-run savings derived from cheap help, insufficient, inadequate, unqualified, and poorly compensated staffs. This is wasteful,

inefficient, and extremely costly in the long run.

Inadequate community facilities necessary for the health, education, and welfare of the mentally retarded cause many of these individuals to become and remain tax consumers rather than taxpayers. Some may have to go to the institutions, but some could live in the community for 10, 15, to 20 years with the proper training and education, and then, when institutionalized, they can become working or contributing members in their new home, thus saving more tax money.

Let's look at this from another angle in thinking of our tax dollars—the family. We sometimes find that, due to the frustration of having a mentally retarded child, the unceasing attention required in caring for a person who will always remain a child, and the terrific expense involved in seeking and providing help for the retardate, that those responsible or faced with other serious problems, such as broken homes, mental illness, alcoholism—this is one of the compulsions, I guess, the gentleman spoke of yesterday—dope addictions, juvenile delinquency, et cetera. This makes still other burdens on the taxpayer's money whereas, if equal opportunities were offered for our less fortunate children, as are offered for our normal children, whatever normal is supposed to be—and I also have two other children—and if the public were more understanding in accepting our retarded youngsters with their limited abilities, and the parents were helped to adjust to the limited potentials of their child, we could erase some of the social stigma that still causes so much distress in these families.

I have attempted to point out some of the needs for more and better facilities, staffs, and services for the mentally retarded. Federal legislation being considered at this time could go a long way in helping to

alleviate this.

I am also speaking in support of H.R. 3465, known as the independent living bill. And I would like to put particular emphasis on titles II and IV. Vocational rehabilitation services should be extended, particularly for our severely retarded and for other severe handicaps.

Is it fair to neglect a person, a fellow human being, because the agency does not feel that he can be vocationally rehabilitated? How can someone be vocationally rehabilitated if he has been habilitated in the first place? Should we not provide the opportunities for these individuals to actually prove their potentials?

This points up the need for continuity between special education services and rehabilitation, especially for the mentally retarded chil-

dren who will forever remain retarded children.

In closing I would like to say that we as taxpaying parents of retarded children want only for our children what parents of all children want. If it takes more Federal help to enable this special group of children to find their places in society, we urge you to give this your special consideration.

Thank you.

Mr. Elliott. Thank you so very much, Mrs. McMeen. You have presented us with a fine, thought-provoking statement.

The subcommittee will take a brief recess.

(A brief recess.)

Mr. Elliott. The subcommittee will be in order.

Our next witness is Mrs. Thomas S. Womack, director of the Lions School for Visually Handicapped Children, Inc., Memphis, Tenn. We are happy to have you, Mrs. Womack. You may proceed in any manner you see fit.

STATEMENT OF MRS. THOMAS S. WOMACK, DIRECTOR, THE LIONS SCHOOL FOR VISUALLY HANDICAPPED CHILDREN, INC., MEMPHIS, TENN.

Mrs. Womack. Thank you, sir. I am glad to be here.

Even though I am here representing the organization stated, I want you to know that I am interested in all blind children.

I do not have a beautifully prepared speech. I am here to state simple facts as I see them and to plead for those facts.

BLINDNESS

As a teacher of preschool blind children and the executive director of a school for blind children, I fully realize the importance of finding these children as soon as possible. At the time when blindness is first diagnosed, it is at this time that the parents need help, learning how to cope with blindness. In so many instances parents will hide their blind children from the public, overprotect them, or neglect them.

Those of us who work with blind children and do counseling with the parents need to find these children to offer our services, but we need help in finding them. We would like very much to have a State law passed in Tennessee which would make mandatory the registering of all people who are found to be blind as soon as the diagnosis has been made. Any physician or optometrist making the diagnosis should be required to report his diagnosis perhaps within 30 days to the proper person, place, or organization. The most logical person, to my way of thinking, would be the director of the division of the blind in the State department of education, or the local board of health and welfare.

By such a law or bill the blind could be given chances to do their

best and to become contributing citizens within the community.

Then, may I plead for the mentally retarded children? Another concern, we feel, is for these blind children who are mentally retarded. Where do they go? Why isn't there a school for them instead of institutions for the mental condition where the blindness is not recognized?

So many mentally retarded children are educable and can participate effectively in society with appropriate rehabilitation and education. There are schools provided for the slow learner, the cerebral palsy, deaf, and also the blind. But there is nothing for these children who are multiply handicapped in Tennessee or the southern

region. They have the same rights as other children.

The most logical place, it seems to me, would be a unit added in the State schools for the blind where the mentally retarded condition could be studied and helped by the school personnel as well as the Lions. Or perhaps funds, Federal, State, or local, could be set up for the indigent mentally retarded blind child, to be sent to a special school where his dual handicaps would be met and helped, one such

school being in Pennsylvania.

This is a most pressing and urgent need in the State of Tennessee. Several of these blind, mentally retarded children, on reaching the age of 7, have been dropped by the Lions School for Visually Handicapped in the city of Memphis. They are all trainable, and most of them are educable if provided with a special school. They could all become contributing citizens, rather than burdens on the taxpayers, in institutions where they are just vegetables receiving only custodial care.

Mr. Elliott. Mr. Quie.

Mr. Quie. I would like to ask you this question: In Tennessee, is there a checkup given to all children when they enter school to find

out if they have any handicaps of any kind, especially visual

handicaps?

Mrs. Womack. Yes; there is. Well, I will not say a checkup; no. I do not think that is done. Of course, I am in a private school, you understand, supported by the Lions. But I do think, if there would be any doubt as to the visual handicap, certainly; yes, they would be checked very closely.

Mr. Quie. Do you not think in many cases this is too late in regard

to visually handicapped children?

Mrs. Womack. Yes; I do. That is why I think it so important that we find these children. We have found some of the children at the age of 6 and 7, and they were not walking or talking, not because they are blind, but because the parents did not know how to cope with this handicap. They had hidden the children away. They thought there was nothing that could be done for them. They just left them by themselves. Of course, we haven't taught them to walk; we haven't taught them to talk; but we have stimulated them, loved them, and motivated them.

Mr. Quie. I think there is a great work that has been done by the societies for certain handicapped children which brings better educa-

tion of the parents.

Mrs. Womack. That is true. In the school where I am that is one of the services we offer: counseling with parents. I feel that that is one of the most important jobs in the school. That is why I feel it is so important that we find these children as soon as blindness is diagnosed.

Mr. Daniels. I note, Mrs. Womack, that your school is incorpo-

Mrs. Womack. It is incorporated; yes.

Mr. Daniels. Are you subsidized or financed by the Lions Club

International or by local chapters?

Mrs. Womack. Local chapters. Our budget is underwritten by the E. H. Crump memorial football game that we have every fall. And then we have, of course, contributions, memorials, offerings, and gifts.

Mr. Daniels. How many teachers have you?
Mrs. Womack. There are only two teachers.
Mr. Daniels. Where did they get their training?

Mrs. Womack. I, myself, was sent to Syracuse University by the Lions, and to Tufts University in Boston.

Mr. Daniels. How about the other teacher?

Mrs. Womack. She trained under me.

Mr. Daniels. How many students have you in your school?

Mrs. Womack. We have 13, now.

Mr. Daniels. How long have you been in existence?

Mrs. Womack. Five years.

Mr. Daniels. During that period of time, how many students have you had attending the school?

Mrs. Womack. There has never been under 12. The capacity is

15, with 2 teachers.

Mr. Daniels. And do you conduct a full course in the primary

grades from the first to the eighth?

Mrs. Womack. No. Ours is just nursery and kindergarten. But we try to get these children socially able and ready to go into public

school, if they are public school material. And one of the schools in Memphis does accept the blind children, and, if they are not, some of them go to the State school for the blind. And, as I just said, we have some who are mentally retarded blind, where they have no school.

Mr. Daniels. Thank you. Mr. Elliott. Thank you very much, Mrs. Womack.

Our next witness is Mrs. Marion Thrasher, president of the Alabama Foundation for Hearing and Speech, Birmingham, Ala.

STATEMENT OF MRS. MARION THRASHER, PRESIDENT, ALABAMA FOUNDATION FOR HEARING AND SPEECH, BIRMINGHAM, ALA.

Mrs. Thrasher. I am Mrs. Thrasher, president of the Alabama Foundation for Hearing and Speech, which is a private organization dedicated to promoting activities that will benefit children and adults with speech and hearing problems.

As you are well aware, the availability of trained personnel is the only solution to the problems facing special educational programs. But here in Alabama we have a serious barrier that would prohibit our using trained teachers if they were immediately available.

I am familiar with the system of education under which we operate in Alabama, and I do not believe the Federal Government would take over a matter that is purely a State matter. But I believe the Federal Government can offer help on practical and enlightened systems of

special education.

I would say that our most urgent need now, while waiting for people to be trained, is professional guidance in planning and developing special educational programs. Until such time as there is developed, on the State level, a State department of special education, staffed with experienced administrators, trained in the specific needs of each field of special education, the Federal Government, I think, could make available, to communities that requested them, consultants who would study local problems and resources and give advice to

interested local groups.

Since 1948 the Junior League of Birmingham has put over \$200,000 into the speech and hearing program that is now established in Birmingham, Ala. Had the medical facts and accurate advice been available within the first 5 years of these efforts, at least one-third of this amount could have been channeled into broadening the scope of the service and making it more effective. As it was, an enormous amount of money and effort was wasted on learning through trial and error that which could otherwise have been saved had there been somewhere to turn for advice. Even now, requests of the Office of Education in Washington, for specific facts and for suggested recommendations regarding the proposed program developments, are not considered on an individual basis, and the general information that is supplied cannot be sufficiently interpreted by us amateurs in order to evaluate in the best interests of those directly concerned.

Throughout the State of Alabama within the past 5 years there have been, to the speaker's knowledge, private groups in Huntsville, Montgomery, Decatur, and Mobile who would have spent time and money in helping to support local education programs had there been

somebody to tell them how to get going.

Presently, a group in Pensacola, Fla., is begging me, who am quite inadequate to guide such a project, to come to Pensacola and advise

them how to begin a hearing and speech clinic.

Consultants, trained in understanding legislative provisions and experienced in the various problems in initiating special education programs, would lend encouragement and confidence to local lay groups who, in Alabama especially, will have to be relied upon to begin special education programs.

Of course, as you already know, we do need trained personnel to plan, administer, supervise, and teach the special education programs. This will be a rehash of what you have already heard and what

you know, but I would like to say it anyhow.

Direction and coordination of any program before the direct services themselves, of course. But in the poorer States, such as Alabama, well-meaning people have considered it wise to furnish the services and skimp on the trained personnel for the important planning step.

In Jefferson County there is no formal coordination of the 74 existing special education teaching units, and such direction is essential to utilize more efficiently the pitifully insufficient number of spe-

cial classes.

Based on incidence figures of the U.S. Office of Education, only onetenth of the children needing special education training are now receiving such help in Jefferson County. Plans were formulated 3 years ago for the five school systems in Jefferson County, which is the county in which Birmingham, the largest city in Alabama, is located.

Plans were formulated to hire jointly a director of special education to furnish the guidance and supervision recognized as necessary. But within these past 3 years no one has been found who was sufficiently

trained to assume this position.

Throughout the 12 years of existence in Birmingham of a day school program for deaf children, there have been 3 years in which the entire class of older deaf children has had to be dismissed because it was impossible to locate a trained teacher. Each class dismissed meant that the money and efforts put into the children's previous efforts had been

wasted as far as continued oral education was concerned.

In Birmingham, because of a salary differential made possible by the Alabama Foundation for Hearing and Speech, and also because we have not been able to receive State support for but 4 of the 25 speech therapists needed in this area, we have not had unusual difficulty in finding speech therapists. The speech therapy program in the public schools, however, has been operating without a supervisor since the close of the school term in May of 1959, even though the teacher unit and supplemental salary has been available.

Only two answers were received to an advertisement offering the salary in the median range that ran in three trade journals for 6 months, and both of these people received better offers from their old

employers.

The Alabama Foundation for Hearing and Speech began offering scholarships in the field of deaf education 2 years ago, and we have found that there are plenty of qualified persons interested in the field. Presentation of the advantages in special education careers and the offer for the education will draw good people right here.

While Alabama is not presently doing its part toward offering job opportunities in deaf education or in speech therapy, there were over 350 deaf classroom teacher vacancies throughout the Nation at the beginning of this school term. These figures do not include provision for a portion of the school-age population that has been generally neglected in special education services—the hard-of-hearing child.

Without supplemental training from a trained speech-and-hearing therapist, this child becomes a costly school failure and also tends to become socially and economically retarded. Educational retardation occurs more than three times as often among hearing handicapped

schoolchildren as among those with normal hearing.

They constitute about one-quarter of 1 percent of the school population, or in Jefferson County about 300 children. One hearing therapist in Birmingham public schools is presently serving 15 hard-of

hearing children.

Alabama is so far behind in filling basic educational needs, only 305 special education units for the entire State, that she will hardly allocate funds toward training special education personnel. So we must look to Federal grants for graduate and undergraduate training to fill our needs.

Thank you.

Mr. Elliott. Thank you very much, Mrs. Thrasher.

Are there questions?

Mrs. Green. Part of your testimony shows great optimism, that

you think there are people that are attracted to this field.

Mrs. Thrasher. We are sure there are. We have applicants right now who want our scholarships for training for this coming year, but we do not have the money for the scholarships. We know of people. We can name them.

Mrs. Green. At one point in your testimony you said that there would be individuals and lay groups who would get into this field if they had someone to whom they could go for help and guidance.

Mrs. THRASHER. Yes.

Mrs. Green. Are you suggesting that this must come from the

Federal Government; that it is not supplied at the State level?

Mrs. Thrasher. Well, it is not supplied presently at the State level, and we feel that that is one reason we need generally trained people in the field. The people who are now at the State level in special education have been people who have learned on the job. They have been well meaning and have exerted themselves to the extent of their abilities, but there is not enough guidance in the State department of education to understand—this is in my opinion, you understand—to understand the general problem of education in Alabama.

There are people who do understand it, but we need to be more infiltrated with understanding throughout the whole department of education before the system can be adapted to what Alabama needs.

We are behind in an interpretation of special education laws and, until we have more trained people who will help the administrators understand the problem, I feel that we will not take any steps toward solving our immediate problems.

Mrs. Green. Thank you.

Mr. Elliott. Thank you very much, Mrs. Thrasher. Your testimony will be very helpful to us.

Our next witness is Mr. W. P. McMullan, Jr., president, Mississippi Association for Mental Health, Jackson, Miss. Mr. McMullan?

If Mr. McMullan is not here, our next witness is Dr. T. Earle Johnson, head, Department of Speech, University of Alabama, University, Ala.

It is a real pleasure to have you, Dr. Johnson.

STATEMENT OF DR. T. EARLE JOHNSON, HEAD, DEPARTMENT OF SPEECH, UNIVERSITY OF ALABAMA, UNIVERSITY, ALA.

Dr. Johnson. May I say, Mr. Chairman, at the time you were at the university we did not have a speech and hearing clinic. There was very little speech and hearing at all going on in the State of Alabama, speech and hearing training, and it was not until some years later that the clinic was established and we began a training program.

My purpose in appearing before you, however, is to strongly support House Resolution 494, and, if I may say so, its companion resolution in the Senate introduced by the senior Senator from Alabama, Senate

Joint Resolution 127.

I should like to urge the immediate consideration of these resolutions and their enactment into law. They are very important, very important pieces of legislation, which take a long step forward in a needed program of training, particularly under title II, the area of competence in which I can speak, relating to the training of speech pathologists and audiologists. There are not enough.

This would not solve all of the problems in terms of special education; it would not solve anything like all of the problems that are existing in the training and work of the handicapped or even in the area of speech and hearing; but it is a tremendous—in my judgment—step forward, so I should like to go on record as urging its

early enactment into law.

It provides for training grants and for stipends for individuals in training, working toward the advanced degrees or advanced training

in speech pathology and in audiology.

We made a small beginning along this line through the National Defense Education Act. I am not familiar with exactly the way it is administered, because the university is not eligible to apply for such, but in the morning mail I received an announcement from the University of Iowa, for example, announcing national defense graduate fellowships in hearing science, a few that have been allocated to the University of Iowa, for example. There have been others to a few other institutions.

Mr. Elliott. Let me interrupt you a moment, Dr. Johnson.

As I understand it, the University of Alabama or any university would be eligible to receive grants of fellowships in the field of speech if it extended or expanded its department of speech into the graduate level competent to the awarding of a doctor of philosophy degree.

Dr. Johnson. That is my understanding.

Mr. Elliott. At the university now, do you give the master's degree in speech?

Dr. Johnson, Yes.

Mr. Elliott. So if we could stretch one bit further, we might be able to take advantage here in the southeast?

Dr. Johnson. That is a point I would like to make. With your permission, I will skip what I was going to say and come back to

that. I do want to speak to that specific point.

In the entire southeast—and by the southeast I will stretch that to include the 14 States represented in Atlanta on Monday and Tuesday—in that entire area there are only three institutions giving advanced degrees, giving a doctoral program in speech pathology and audiology.

Of those three, not a single one, not a single one of them granted a Ph. D. in those areas in the year 1958. I do not have the figures for 1959, but during 1958 there was not a one. So in the entire southeast.

there is urgent need, it seems to me, for this program.

In the entire country, there are 135 institutions granted advanced degrees, master's or doctor's. Of course, some 26 gave doctorate degrees, awarded doctorate degrees, in 1958. They gave a total of 123. This is the entire field of speech, including radio, television, drama, public address, and speech and hearing, speech pathology and hearing. So when we come down to that we find there were 35 doctorates awarded in 1958, 22 in speech pathology and 13 in audiology.

Mr. Elliott. Those 35 you would say met what part of the need

for that year, Dr. Johnson?

Dr. Jöhnson. Probably one-tenth. A year ago I was looking for an audiologist. I do not know how many were graduated in 1959, but of those I could find only one man getting his doctorate in audiology that was interested in coming south and in coming to the University of Alabama.

I had to compete with four other institutions, including one in the State of Connecticut, in trying to get him here. We compete on a national basis. He came and joined our faculty and is making a

very fine contribution.

Most of the ones, however, who did get the degrees and who do get them go back to the institutions from which they are on leave, because it is an inservice training program. At the University of Alabama we serve not just Alabama—as a matter of fact, we serve Alabama in this area to a small extent. We serve the entire southeast of the Nation.

I have seven graduate students in the area of speech pathology and audiology working toward their master's degrees. These seven represent six States, one being from Alabama and two from Iowa.

When they graduate they will not take jobs in Alabama because of the large number of jobs that are available elsewhere at consider-

ably higher salaries.

Mr. Elliott. I do not want to belabor this point, but at the time we passed the National Defense Education Act there were 163 colleges in America granting the doctor's degree. We thought that by the stimulus of the fellowship for the student and the grant to the college of \$2,500 to help get the program underway, that that might result in a great expansion of graduate courses in America, and I think it is having that effect.

Dr. Johnson. It is.

Mr. Elliott. But it seems to me we may have hit upon a way whereby graduate work in speech might be expanded here in the

Southeast under this program. I am glad you are thinking in those terms.

Dr. Johnson. Those are exactly the terms I am thinking in, sir. I believe that at the University of Alabama, for example, some departments, the department of romance language, to mention one, which has recently announced a doctoral program, I feel that, to a considerable extent, is due to the interest, stimulation, and possibly the scholarships, if they have been awarded, that the university has received in that area under the National Defense Education Act.

You mentioned, I think, a figure of 167 institutions granting doctoral degrees. Of those, only 26 gave doctorates in 1958. There may be a few others, and there have been some recent ones, so at most, probably only 40 institutions, I would estimate, throughout the coun-

try, gave a doctor's degree in speech.

That whole area is new. The first course in speech pathology was given in 1950 at the University of Wisconsin. The first doctorate in the area was 1952. So it is new compared with the other endeavors.

If I may quickly summarize, it seems to me that in the area of advanced graduate work in speech, particularly in speech pathology and in audiology, there are three things which might be done in terms of assistance to a university and a department, such as I am affiliated with and have the privilege of being the head of, and that would be first, through institutional training grants and the fellowships, such as are awarded at the present time under other Federal legislation, national defense legislation.

So I would like to endorse that and endorse those features of your particular resolution. A third way in which it might be done would be through the establishment of visiting Federal scholars. We have programs under State Department and under various acts whereby scholars may visit other countries, they go to other areas, and some

of these are particularly sought after.

I refer to what are commonly known as the Fulbright scholars, where we pay all or a portion of the expenses of a visiting faculty

member from one institution in this country to go abroad.

It seems to me that we need also to adapt that principle to our own country, and in helping us develop in certain areas, particularly in the southeastern part of the country, a program of visiting scholars, where one could come into an institution as a visitor for a year or two, and help and strengthen that particular program.

There is a definite need, I feel, in this particular area. I am thinking of retired professors who might be available for such, and I am thinking of younger and other people who would like to help

develop programs in other parts of the country.

So I would suggest that as a third facet and a third way in which support could be given to the establishment of programs, particularly

in the area of speech and hearing.

I appreciate very much the opportunity of appearing before you and saying informally these few things which are very meaningful to me. I have been in this work at the University of Alabama since 1928, something that I am giving my life to in my work. I am very much interested in it. I intend to stay in Alabama, promote it and develop it.

I appreciate the opportunity of appearing here. I appreciate your interest and your patience, particularly your patience in sitting here listening to so many of us as we talk about this problem.

Thank you.

Mr. Elliott. Thank you, Dr. Johnson.

Mr. Elliott. Our next witness is Mr. Lloyd M. Dunn, chairman, Education for Exceptional Children, George Peabody College for Teachers, Nashville, Tenn.

STATEMENT OF LLOYD M. DUNN, CHAIRMAN, EDUCATION FOR EXCEPTIONAL CHILDREN, GEORGE PEABODY COLLEGE FOR TEACHERS, NASHVILLE, TENN.

Mr. Dunn. Thank you, Mr. Elliott. We appreciate you and your committee coming to the South to learn firsthand of our needs in spe-

cial education and rehabilitation.

From the testimony you have already heard here, in New York and in New England, I surmise that there has been evidenced many and similar needs in each of the areas of exceptionality. May I desist from citing facts and figures to support those needs this morning, because we have come to respect the knowledge which you as a committee hold. In fact, I suspect you know these needs even better than we in many of the areas.

Mr. Elliott. May I say to you, Mr. Dunn, that perhaps a little of

it has rubbed off on us.

Mr. Dunn. Yes. Permit me to cite three points of view as frames of reference and then discuss briefly recent and pending legislation.

First I should like to reiterate what you heard repeatedly this morning in the strongest plea that the Federal Government give No. 1 priority to the training of personnel. Ordering the morass of recurring evidence that has been presented to you seems possible if you group them in three categories: first, research, personnel, and services. Certainly the aim is to provide better services to all the disabled so they may become better members of society. Both our very way of life and survival depend on us achieving this goal.

While we need research on prevention, on treatment, on amelioration, on training and on education, neither the research nor the services can be conducted in a vacuum. In my judgment the most critical need of all is for the trained personnel I have already mentioned.

Without these highly skilled and learned individuals, worthwhile services and fruitful research will not be possible. Certainly Mrs. Brown's testimony this morning, and Mrs. Green's and others of you on the committee's interest in this point of view supports it.

Turning now to my second plea, for comprehensive legislation rather than piecemeal Federal legislation, we need personnel in each of the 10 areas of exceptionally, and who is to say truthfully in which

area there is the greatest need.

We need teachers, we need consultants, we need researchers, we need college instructors, we need programs at the bachelor's, master's, and doctor's levels. In each area and in each level the shortage is acute. We can strive for this Federal legislation one field at a time, and this would involve a great series of bills.

Furthermore, the administrative inefficiency and the legislative problems would seem to me to go on ad infinitum. However, I realize this is the way legislation often comes about. Interest groups in a specific groups mobilize public and legislative support most intensely in their own specialty.

It is difficult to get people excited about broad, comprehensive legislation, even though this type of legislation would serve the best in-

terests of the interest groups in the long haul.

I certainly, however, propose that it would be more statesmanlike, more professional, more economical and more efficient to think in terms of comprehensive bills. Perhaps this inclusive legislation might include provisions for raising the status, responsibilities and opportunities for the various agencies and sections which serve the handicapped and the gifted.

Here, for example, it might be possible to bring closer cooperation and articulation through some sort of Federal coordinating council. This brings me to my third plea. Taking the long view, we would probably be better served by suspending action on Federal legislation at this time until your findings from your long-term special educa-

tion and rehabilitation study become known.

However, because the need is so great, we would certainly appreciate these findings at least in some form being made available to you as a committee before the end of this 2d session of the 86th Congress. In fact, we would be most delighted if Federal legislation could grow out of the study before the 86th Congress terminates.

From within this framework, I would like now to turn to recent and pending legislation. We are indeed greatly indebted to you, Mr. Elliott, and to your subcommittee, and to the parent committee under the chairmanship of the Honorable Graham Bardon, for Public

Law 926

I believe at the recess you had opportunity to meet two of the fellows presently in that program. I understand in your audience yesterday you had some eight or nine who were from other centers,

including Peabody College.

It was certainly an essential first step in getting us out of the doldrums in terms of school programs for the retarded. We need these people and we need many more of them for leadership roles in the South and in the Nation. But Public Law 85–926 has special interest to us at this time on two counts.

First, if comprehensive legislation specifically for training personnel is contemplated, perhaps this might best be accomplished by making minor alterations in 85–926 and amending it to cover all types

of special educators.

Second, we can learn much from the operation of Public Law 85–926 even though it has been in operation less than a year if we plan even more broadly and more omnibus legislation. Naturally, difficulties have developed which could not have been envisioned when this bill was written. One problem is the sharp dividing line between section 1 and section 2.

Colleges and universities are restricted to applying directly only for grants to train college instructors. There is also need for the removal of the time and financial ceilings if this law is to be broadened. Researchers cannot be trained under this piece of legislation as it is

presently interpreted.

Furthermore, it has not been implemented with respect to the training of teachers of the mentally retarded. I would certainly support Commissioner Derthick and his staff for taking this position. They had a small amount of money. They chose to expend it on leadership

and training. That seems to me very wise.

But as you also heard this morning, we also have an acute shortage of the teachers. Other complications have arisen and, thus, if you do contemplate broadening 85–926, I would greatly appreciate the opportunity of testifying before you again on ways of making this law more functional.

In general, more latitude could be built into it, similar to the training programs of OVR and NIH, which are excellent models of sim-

plicity, efficiency, et cetera.

May I turn now to House Resolution 494, and first I would like to say, as you would surmise from my first position, that I am strongly in favor of Federal aid for the training of speech and hearing personnel.

As was recorded in the U.S. Office of Education Bulletin in 1954, teachers of the deaf were more difficult to secure than teachers in any other area of exceptionality, and the number of requests for public school speech correctionists was exceeded only by requests for qualified teachers of the mentally retarded.

I believe this critical shortage has become even more acute in the last 6 or 7 years. However, if it seems expedient to move ahead on this piece of legislation rather than wait for broader and more functional legislation, then may I raise some questions and elaborate on them?

Under title I, first, as the resolution stands now, will only residential schools for the deaf be eligible to apply for grants-in-aid to train teachers of the deaf when more than 25 percent of the teachers of the deaf of this country are employed in the day schools?

Furthermore, in 1953-54 there were 22 colleges and universities in the Nation with full sequences of preparation in this field. Would

none of them be eligible to apply directly to train personnel?

Second, does the specified advisory committee have administrative responsibilities? To what degree would it hamper the U.S. Commissioner of Education and his staff in carrying out this measure? Is the membership of the committee as it now stands balanced or would it promote a conflict of interest?

Three, will we be able to train educators to work with the hard of hearing, those children who are less than profoundly deaf under the

legislation the way it is presently written?

Under title II, first, does the Office of Vocational Rehabilitation already have authority for training speech and hearing personnel? Does that agency not in fact now support a number of training programs across the country?

Two, are trainees on OVR grants requested to indicate their intent in facilities serving adults? If this is the case, would it be possible

to train public school speech correctionists under section 2?

Of the 10,000 speech correctionists presently employed in the United States, more than one-half are working in the public schools. Furthermore, Dr. Wendell Johnson has estimated that probably 90 percent of the speech and hearing therapy provided school-age children is provided from within the public schools.

Turning now to both titles, there are three other questions: Will it be permissible to train personnel at both graduate and undergraduate levels under this legislation?

Two, will it be possible to grant funds to initiate new training

Three, will we be able to train researchers, college instructors and consultants?

Finally, could not a broader piece of legislation serving education, vocational rehabilitation, Children's Bureau, the National Institutes of Health be devised and the authority for it rested in the Secretary's hands of the Department of Health, Education, and Welfare, and thus give us broader coverage, so, as Dr. Johnson said, we would more nearly meet the broad need of turning personnel for speech and hearing positions at all levels of our country?

Mr. Elliott, it has been a privilege to come before you today. I did a good deal of soul searching before presenting this testimony, as you might surmise. It would have been much easier for me to appear before you and point out the general, favorable aspects of 85–926 and the other bill. In fact, I think I could have lived with my friends

easier.

But I hope my comments have been useful. They have been intended to serve the interests of all disabled and abled people in the country. First, Federal personnel should be given training; second, comprehensive legislation would be better than piecemeal measures; and third, we should await at least the tentative findings of your study group before taking legislative action.

However, because the needs of special education are so great, we hope that enactments will be possible before the second session

terminates.

Mr. Elliott. Thank you very much, Mr. Dunn. Your statement has been very helpful and challenging. I appreciate the efforts you have gone to to point out the ways in which improvements can be made.

At this time for the benefit of the record, I would like you to present

the two students who accompanied you.

Mr. DUNN. Yes. We have with us Mr. Haudle, of South Carolina,

and Mr. Polk from the fine State of Tennessee.

In case the committee is worried, maybe I should add one other note. I am not a citizen of the United States. I am from Canada, from Saskatchewan, Mrs. Green will surmise.

My family and I have been in this country on immigrant visas since

1950. Thus, we are here by choice.

Mr. Elliott. I hope you will soon have your citizenship certificate.

Thank you very much.

Dr. Barnard. Before adjourning, I would like to request permission that the statement of Dr. John A. Boston, Jr., director of the Austin Community Guidance Center, be made a part of today's record.

Mr. Elliott. Without objection, the statement referred to will be

made part of the record.

(The statement referred to follows:)

STATEMENT OF DR. JOHN A. BOSTON, DIRECTOR, AUSTIN COMMUNITY GUIDANCE CENTER

As a physician interested in the problems of mental deficiency, I welcome this opportunity to express professional opinion in regard to the needs of the mentally defective. Some of my opinions are possibly irrelevant to the specific issues under consideration, but are offered because of the opportunity to present them to a distinguished group of citizens. The problems of the mentally defective are important ones for many reasons. Many of the difficulties are unsolvable at the present time and await future scientific achievement. On the other hand, the problems are themselves changing, the approaches to the problems are changing, and many of the old traditional policies can be improved upon. Any Federal aid must be thoughtfully provided or such expenditure of funds will not be effective.

There are four elements which have impact on the problems of the mentally defective.

The first of these is the advent of modern sanitation since the early 20th century. This engineering and bacteriological achievement insures that many of the less biologically sturdy members of the population will live an increased lifespan.

The second factor is the advent of modern antibiotics with the use of sulfa drugs since the 1930's and penicillin and newer antibiotics from 1942 on.

The third significant factor is the use of anticonvulsant drugs, particularly the use of the drug Dilantin since 1935. Anticonvulsant drugs have to some extent eliminated the "epileptic colony" as an institution and, in general, removed the more intelligent and able epileptic patients from such institutions, since modern drugs enable them to function in society. Thus, the ratio of the mentally defective to the epileptic in institutions has been altered so that there are many less epileptics compared to the mentally defective per se.

A fourth and important factor is the interest of scientific disciplines in the problem of mental deficiency, dating largely from the 20th century. It is only in the last 2 decades that psychiatrists, for example, have had a strong clinical interest in the problem of the mentally defective. This is also true of biochemists, psychologists, and many others.

One convenient grouping of mentally defective individuals is the high grade, with intelligence quotients from 50 to 70; the intermediate level, from 25 to 49, approximately; and the low grade, with intelligence quotients below such levels. The problems of each group are different.

Among the low grade defective individuals, there are many with such severe damage to the brain that the individual is incapable of any degree of care of the self and must remain in bed. Prior to some of the developments mentioned above, the lives of such individuals were terminated in the early decades by bacterial pneumonias or other infections. At the present time, institutions such as the Austin State School have roughly a fifth of their population as such cases. Just as the antibiotics and modern sanitation prolong the lives of these helpless individuals, expert medical care in an institution prolongs their lives beyond what it would be if they received intermittent medical care in their own homes. The presence of such individuals in institutions is humanitarian in many respects and relieves the burden for their families. On the other hand, each such patient in an institution excludes one or more other patients who might receive equal or greater benefit from such institutional care. A policy which excluded or decreased the number of such mentally defective individuals, namely, those requiring bed care, from institutions would not be politically popular, but the problem should receive objective consideration. Those low grade defective individuals who do not require bed care in general get custodial benefit only from care in institutions.

Among those in the intermediate level of mental deficiency, there can be a number of satisfactions and pleasures in institutional living. In general, this group do not have many psychiatric (emotional) difficulties, but are in the institution primarily because they cannot be self-supporting and may be a social problem when their lack of judgment leads them into various difficulties. For females of child-bearing age, the risk of pregnancy may be a very important factor in seeking institutional care for such an individual. Efforts to sterilize

such females as a more aggressive way of dealing with this problem have not been pushed and, again, might not be a politically popular procedure. Again, objective evaluation of such policy might be useful.

The high grade defective individual, previously described by the term "moron," who live in institutions are frequently there because of phychiatric and

social problems, rather than mental deficiency per se.

There have been a number of scientific papers published, and my own experience is parallel to this, stating that many of these individuals are not in institutions for the mentally defective because of the mental defect in itself. Many such people in this intellectual level, who do not have phychiatric nor social difficulties, are self-supporting and may be substantial citizen-assets. In many institutions for the mentally defective, this group of patients is receiving increasing psychiatric, casework, and psychological care as part of a rehabilitation program. In the central Texas area a private rehabilitation program for young men in this category has had considerable success by training the boys for a 2-year period and then giving them direct help as they leave that institution to go into the community and become self-supporting through their own work efforts.

The psychiatric or social difficulties of such individuals are not always surmountable and many will require permanent institutional care. On the other hand, it is the rare institution, State-supported, which can furnish as much professional help as it would like to offer to such individuals. Certainly, num-

bers of institutions furnish little or none.

Among those who remain in institutions, sexual problems in their behavior make the institutional adjustment more difficult and may be a significant factor in preventing their rehabilitation outside the institution. Much of the old traditional approach to such high grade defective individuals in the institution is to prevent contact between the sexes because of the risk of pregnancy occurring. It would seem to me that objective consideration should be given to sterilization of some of these individuals and allowing them to marry within and remain within the institution. One might speculate that among such individuals some couples would progress to a self-sufficient existence outside of the institution. The climate of public opinion is probably not ready to endorse such recommendations at the present time, but public values in future years may be different.

Any recommendations contained in the above do not get at the basic causes of mental deficiency. Certainly, the present Federal support of broad research and basic research in these areas is to be commended. On the other hand, scientific breakthroughs in this area may never eliminate all of the causes of mental deficiency and, for the immediate present, eliminate relatively few.

Foster home care outside of the institution is reported to be successfully used by some of the Scandinavian countries for improved psychiatric patients. One would expect that it would be similarly useful for certain high grade defective individuals, particularly if standards can be maintained in the foster home care. Not having had direct experience with such measures, I cannot give specific testimony on this point.

Mr. Elliott. After lunch we will proceed with Mr. C. Robert Graves, of the Florida Federation of the Blind. He will be the first witness.

At this time I have a telegram from Mr. Tom Pettus, from Moulton, Ala., with respect to the testimony yesterday of Mr. Percy Sessions. Without objection, this telegram will be made part of the record at this point.

(The telegram referred to follows:)

Hon, CARL ELLIOTT.

Chairman, Subcommittee on Special Education and Rehabilitation, Courthouse, Cullman, Ala.

My congratulations and my heartfelt appreciation for inviting Percy Sessions to appear before your subcommittee. No one ever became an alcoholic from choice and if it takes 5 to 15 years for one to develop your educational system is lacking and failing the people. Convinced the Alabama Commission on Alcoholism on the prevalence of alcoholism and need for treatment in the dry and

rural area of north Alabama, having courage to undertake this intervention the commission will open an outpatient clinic at Decatur whenever a psychiatrist available. We need more psychiatrists and more of that courage.

TOM PETTUS.

MOULTON, ALA.

Mr. Elliott. I would like to recognize Dr. J. Howe Hadley, former Tuscaloosa city school superintendent. We are happy to have him with us.

I understand Dr. Hadley was formerly with the Louisville, Ky., school system, and is now professor of education at the University of

The committee will stand in recess until 1:45.

(Whereupon, at 12:30 p.m., the subcommittee recessed, to reconvene at 1:45 p.m. the same day.)

AFTER RECESS

(The subcommittee reconvened at 1:45 p.m., Hon. Carl Elliott (chairman of the subcommittee) presiding.)

Mr. Elliott. The subcommittee will come to order, please.

We are ready to begin again with the witnesses that we had left from this morning.

Our first witness is Dr. William P. Dorne, chairman, special edu-

cation committee, Auburn University, Auburn, Ala.

We are happy to have you, Dr. Dorne. You may proceed as you desire, subject, of course, to our limitation of about 10 minutes.

STATEMENT OF DR. WILLIAM P. DORNE, CHAIRMAN, SPECIAL EDU-CATION COMMITTEE, AUBURN UNIVERSITY, AUBURN, ALA.

Mr. Dorne. Mr. Chairman, members of the committee, it is an honor, and I come before you with some humility before this Subcommittee on Special Education.

I would like to appear as a private citizen and as a member of the professions of speech and hearing disorders and special education.

As a citizen, I am extremely interested in the welfare of children. As a member of the teacher-training program, I am interested in, if I may use the phrase, turning out the best possible product that I am capable of doing.

As we all know, there are tremendous educational problems facing the Nation today. This is true in the South and it is true in Alabama. Many of these problems are unique to Alabama, but there are many general problems as well. These problems have a way of filtering down to special education and to the areas of speech and hearing.

Dr. Dunn this morning refused to give any statistics or incidence figures. I would like to do the same thing. I would like to leave them

out.

That 2-day study commission in Atlanta undoubtedly has supplied you with some excellent reports, and your own fact-finding agencies probably will do the same. But I wonder if you have been exposed to the problems of the parents, the teachers, and the children.

If I may, I would like to read a sentence or two from three letters that crossed my desk in one week, in January, from three rather different sources. The first one:

I am interested in learning the name and address of the association working with retarded children in Auburn.

There is no association in Auburn working with retarded children. The second one:

I am writing asking for information about schools for mentally retarded children.

By and large, there are no schools for mentally retarded children: classes in an occasional private school, but very few schools.

The third one:

Recently the Valley Association for Retarded Children has been organized in Chambers County. The group is very enthusiastic and has started a day center for trainable, retarded children. Now, of course, they have to find a teacher.

This last sentence, "Now, of course, they have to find a teacher," is the thing that really disturbs me. I doubt that there is one avail-

able teacher of the trainable child in Alabama today.

This is not to say that Alabama has not made progress. Five years ago there were a handful of special classes in the State of Alabama. Today there are over 300, as Mrs. Brown mentioned. This does not mean that we have done all this and we have nothing else to do. Many of these classes are not set up on the proper foundations, and we need to re-do much of what we have done. Our teachers need much more and better training than they have been able to get.

Last night I taught a class in south Alabama. Two things happened in that class, things that we are not taking care of in special education in Alabama today. One English teacher said, "What do I do with the

gifted child?"

This was a good question. I don't think I had the final answer for it. A principal of a good school in this community, treating some 1,000 children from Daleville and Fort Rucker, said he would like to have a speech therapist for next fall, and, oddly enough, I could give him one. I happened to have five available, and this is a little unusual. But we have no units and we have no money.

Some of our participants in the last day or so have mentioned preschool classes. This is practically unheard of in Alabama. A child of 3 years of age with cerebral palsy or being blind or deaf go-

ing to school—we are coming to it. It will be in our lifetime.

These are just a few problems that we have facing us. Some people would have you believe that these problems are the sole responsibility of the Federal Government. I disagree with this. I think a large proportion of our problems should be met by the local and State governments. Yet I think in some instances the assistance of our Federal Government has been needed for some time and is needed today.

I think the introduction of House Joint Resolution 494 is a step in the right direction. There may be many steps to follow, but this is a step, a positive step, forward. I am not overly concerned about

Federal encroachment.

If, as we talked earlier with the Representative from Minnesota, you will set up minimum standards, I think we will abide by them.

In closing, I would like to say that the total committee is to be congratulated. I trust that this bill will be enacted very shortly. Mr. Elliott. Thank you very much, Dr. Dorne.

I recognize the gentleman from Minnesota, Mr. Quie.

Mr. Quie. I have just one question. You mentioned schools for retarded children. Do you think there should be residential schools for retarded children!

Dr. Dorne. I would say not for what we usually consider the truly mentally retarded child, the child that is educable. I think this child often is and should be educated in the public schools. I think the trainable child is another problem, another case, and I think maybe a day school or even a residential school will be one answer to the solution of this problem.

Mr. Quie. You were referring to the trainable child when you

were talking about schools for the retarded child?

Dr. Dorne. I am not sure what the parents meant; whether it was a

trainable child or an educable child.

Mrs. Green. Is not the trend across the country getting away more from the institution for the mentally retarded and the feeling that, if this youngster can be kept closer to his home and his own community and the love and security that that would give him, it would be better for him?

Dr. Dorne. Yes, Mrs. Green; this is very true.

Thirty-two States, I believe is the figure, have now made some provision for the trainable child in their public schools. Many school administrators are fighting this because they are a little leery, and they should be leery in a sense. But this letter concerning the establishment of a day center, I have talked to the school people of that community, hoping to get them to go out on their own and start a trainable class. It would be the first one in Alabama in the public But they are not willing to take the bait yet.

But you are right; we are getting away from institutionalization of the trainable child and trying to put him in a residential school, a day school, or even a sheltered workshop where he can perform at his level and be at least partially self-sufficient. He may never be

completely self-sufficient.

Mrs. Green. Do you see any hope of meeting these problems until the American people are willing to give higher priority to education in general and higher priority to special problems in education and are willing to pay the necessary money to attract the qualified personnel.

Dr. Dorne. No: I think you are right. I don't see much hope for it until they are made aware of it and are willing to pay the price. I think, in relation to the matter of Federal aid and State aid, I believe our Governor is in New York today, trying to get bonds or a loan for \$100 million for school construction. This type of money doesn't come easily to a State like Alabama.

I think we are trying, but I think there is more that can be done by a State and local government, and I also think the Federal Government must help. But you are right: I think that the matter of

public education is of tremendous importance.

Mr. Elliott. Thank you very much, Dr. Dorne.

Our next witness is Mr. A. D. Croft, president, Association of the Blind of South Carolina.

Mr. Croft is not here.

Our next witness is Clay S. Sheffield, a director of the Guidance Department, Birmingham Public Schools, Birmingham, Ala.

Mr. Sheffield. Thank you, Mr. Chairman.

Mr. Elliott. We are happy to have you, Mr. Sheffield. You may proceed in any manner, subject to our limitation of about 10 minutes.

STATEMENT OF CLAY S. SHEFFIELD, DIRECTOR, GUIDANCE DEPART-MENT, BIRMINGHAM PUBLIC SCHOOLS, BIRMINGHAM, ALA.

Mr. Sheffield. Thank you, Mr. Chairman and members of the committee.

I have prepared some suggestions or ideas of ways that I feel that this problem of special education might be met. However, in view of the fact that all of these have been covered by previous witnesses, I will depart from the written statement and mention a few as a matter of emphasis.

Mr. Elliott. Mr. Sheffield, let me say that, following your oral presentation, without objection, we will make your written statement a part of our record. Then the record, when it is written up, will

carry your oral statement plus the written record, both.

Mr. Sheffield. Thank you.

As has been stated here previously by practically every one of the witnesses, it is my feeling that the greatest need in this area is personnel, trained personnel, not only teachers but administrators, school psychologists, social workers, and everyone dealing in this entire broad area.

I would like for emphasis to say "Amen" to what Dr. Dunn said this morning in talking about combining the areas of special educa-

tion, rather than treating them as separate little islands.

We talk about people who have special handicaps or special disabilities, considering them as a group rather than individually, be-

cause most of them have multiple disabilities rather than one.

Mr. Elliott. You are, of course, talking, Mr. Sheffield, about the ideal, and with which I agree, but the legislative mind is something to ponder. When it gets ready to legislate in a particular field you can get legislation, and if it is not, you cannot. So that accounts, I think, for the piecemeal approach.

Two years ago we did, I think, a rather beautiful piece of legislation for the mentally retarded, and we were able to do it at that time, and under somewhat unusual circumstances. But had there been attached to that bill several other categories we could not have passed it.

So, really and truly, what you say is the ideal, and I subscribe to it as an ideal. But I do not know whether we will ever be able to achieve the type of omnibus approach about which you are speaking or not. I just say that for whatever it may be worth to you.

Mr. Sheffield. Perhaps there could be some provision made in the legislation for these individualized disabilities so that there could be

some coordination.

The thing that disturbs me is that we seldom find a mentally retarded child that does not have some of the other disabilities that go along with it. If we take each one and quote them percentagewise, we find that we have about 60 percent of the population which has disabilities, which, of course, is not a true picture. That is the kind of thing I had in mind.

Another thing is—I have not heard it mentioned here, but I think it is very important—that we need special physical facilities for dealing with these people. I am not so sure that that may deserve special thought and consideration, because you get a good teacher, well-trained teacher, identify the people who need the help, and then have no room except one that is not being used but which is keeping the janitor supplies in the schools, and you empty that out and drag the children in there.

That is a critical problem. Buildings are critical in the whole area of education. Again, maybe this is a State problem, but I think maybe

Federal recognition of it might help overcome this.

Mr. Elliott. When you start to legislate in this field, again, and I have been through it now for 12 years, all too often the people who argue that the Federal Government should not contribute anything to these facilities, when the legislature meets they go down and argue that the legislature should not do it, and then when the city council meets they say that the city council cannot do it. So you get sort of

a ring-around-the-rosy effect.

I think we apply sometimes to these educational problems a much higher degree of caution than we do in any other field. Nobody in my district has said to me that the Federal Government should not spend \$9 for each \$1 that the State spends to build these beautiful high-ways, all of which I voted for and which I subscribe to, but nobody feels very much hesitancy about that, and we are willing to tax and retax ourselves in order to do that. But when we get into the field that you are talking about, one in which you and I know that somebody has to answer to the full responsibility, then we invent, often-times, I think, as fictions of our own minds, all of these excuses that prevent us from making the progress that a free civilization has to make if it continues to be free and if it continues to lead the world. Of course, that is my testimony, and not yours, but that is pretty much the way I see it.

I agree with you that if we had the facilities, if we had some way to get the facilities, we could have these special education schools and

these workshops to train the handicapped all around.

We have a little facility in my hometown because a lady over there, Mrs. R. L. Cheatham, was gracious enough to give us the rent of the building for 5 years. Had that not happened, we would perhaps not have the facility there today.

Mr. Sheffield. I am glad you agree with us on that, because that

is one of the big problems.

As I say, these facilities generally are facilities that are not really needed for anything. But we have nothing in that area. Of course, not only a room, but other equipment is needed for this special type of program.

I would like to mention one other thing, and this perhaps can be helped by legislation or maybe it can be done through liberalizing of

directives. That is this business of the coordination of the various

agencies that deal with the child.

I don't know if this legislation is needed here or not. But I think if we could all begin to work together, and I think some legislation might be needed to promote this, but we are all going to be eventually working with the same person if they are a handicapped person, so why not start when we can all combine our efforts. I do not know how that should be written into legislation, but it is a thought that I have had.

In working with some of our people, we do try, but there are certain lines beyond which we cannot go. Vocational education, for example, in my understanding, cannot use their coordinators in D.O. & D.E. for working with certain of these retarded people, for example, unless the retarded people are capable of becoming trained for a job needing 1,500 hours—I believe that is correct—of actual training, in knowing a trade. They do not need to learn a trade, but they do need job adjustment and supervision.

I think the vocational coordinators could be a big help in helping job adjustment. But they do not need the training to learn to wash the car, if that is the kind of a thing that they can do as far as trade

training.

One other point is I would like to say what I think about the residential homes or schools or facilities. I have a great feeling that we need more residential facilities than we now have. Not only do I think that we need them for people who are not going to be able to be self-supporting and self-directing in a free society, but also for those who need it temporarily. Some will need it permanently, but some will need it temporarily.

I think here, because of the type of home situation they have, or lack of home supervision they have, we find that sometimes we can bat our brains against a stone wall trying to help a youngster, and send him to an environment at night where they undo everything we

did during the day with them.

So it would be a great help to have a facility, properly staffed, where we could use those youngsters while we are working with them, and eventually they would be on their own. That would go beyond the mentally retarded. It might go into the emotionally disturbed. I am not thinking of the mentally ill here, but some of the others, the predelinquent type of youngster.

I had an idea that perhaps the CCC-camp idea, a camp work situa-

tion for 14- and 15-year-olds might be a good one.

Mr. Chairman, thank you for your indulgence. I am glad to have an opportunity to appear before you.

Mr. Elliott. Thank you very much for your testimony.

(Prepared statement of Mr. Sheffield follows:)

STATEMENT BY CLAY S. SHEFFIELD, DIRECTOR, GUIDANCE DEPARTMENT, BIRMINGHAM PUBLIC SCHOOLS, BIRMINGHAM, ALA.

NEEDS AND RECOMMENDATIONS FOR MEETING THE NEEDS IN AREAS OF SPECIAL SERVICES AND SPECIAL EDUCATION

I. One of the greatest needs, as I see them, in the area of special education is more trained professional personnel. This would include not only teachers, but school psychologists, school counselors, and school social workers. I would recommend that this program of training personnel receive the same priority as the training of guidance workers and mathematics and science teachers receive in the National Defense Act. I would recommend further that fellowships and cost-of-living grants for short-term and summer workshops be set up for training in these areas similar to those set up to train guidance persons, mathematics and science teachers. I would recommend that a limited number of fellowships and cost-of-living grants be made to persons of demonstrated ability and interest in these fields, where not only school expenses but allowances for dependents and subsistence for the individual be provided for training toward doctoral programs in order that we might provide a high-type leadership to further develop the programs in special education. I would recommend that the program for training school guidance personnel be broadened and extended so that children, and the parents of children, in the elementary grades would receive help at an early age, where our experience has shown that it is most effective.

II. Provision needs to be made for the construction of suitable facilities for meeting the needs of handicapped children which would include rooms in schools designed specifically for the handicapped and also special equipment needed for

working with the area of the specific handicap.

This could probably be provided on some system of matching funds that would encourage State and local boards of education to include this type of building

and equipment programing in all new school plants.

III. There is a need for better coordination of the services of special education, vocational education, and vocational rehabilitation in working with the handicapped in all categories. This is especially true as it relates to the high-

school-aged child.

In this connection, it is possible that some liberalization of legislation with regard to specific requirements in vocational education might be made to allow the vocational education people to work with those individuals whose capabilities are limited to the unskilled and service fields. Vocational education and rehabilitation personnel could serve on the team with special education personnel in job replacement and job adjustment training and supervision.

IV. There is a need for some provision to remove some young people from their home environment and to provide supervision while efforts are being made to assist them in making a satisfactory adjustment to society. These people would not be individuals who would be identified as delinquent. They are, however, potential delinquents. Frequently these young people constitute a major problem to the public schools and the community because of an attitude of antagonism toward compulsory school attendance. They are frequently young people who are too young for the competitive labor market.

I would recommend that some work-camp facilities, along the lines of the CCC camps, be set up where these young people would have specific job requirements, where recreational facilities and education programs would be provided for those who showed an interest. These camps would need to be adequately

staffed with people trained in working with young people.

Mr. Elliott. Our next witness is Dr. Mode L. Stone, dean, School of Education, Florida State University, Tallahassee, Fla.

STATEMENT OF ELLEN THIEL, COORDINATOR OF SPECIAL EDUCA-TION, FLORIDA STATE UNIVERSITY, TALLAHASSEE, FLA.

Mrs. Thell. I am Ellen Thiel, coordinator of special education at Florida State University. The invitation to testify was originally sent to me. I was unable to come, and Dr. Stone was to come in my place. He called me last night and said he could not come, so I came.

Mr. Elliott. Well, we are happy to have you, Mrs. Thiel. Would

you state your position for the record, Mrs. Thiel?

Mrs. Thiel. I am in charge of the training of teachers in various areas of exceptionality in the College of Education at Florida State University at Tallahassee.

Mr. Elliott. We are very happy to have you with us today, Mrs.

Thiel. You may proceed with your testimony.

Mrs. Thiel. Thank you, sir. Your invitation invited us to talk on two points; one relative to pressing needs in the South, both in relation to special education and vocational rehabilitation. I would

necessarily limit myself to special education.

Secondly, any specific suggestions we might have in terms of how Federal aid could help us. I think we need perhaps to take a view of the problem that is far more common in the South, apparently, than any of the testimony given at the New York hearing or such of the Connecticut hearing as I have reviewed thus far indicates. It will be the kind of thing I am sure you will encounter as you move out to the Mountain States.

We have in Florida, for instance, some 900,000 school-age children. You probably know that the political organization in Florida results in 67 counties which also form the basis of our public school system. Nine of these counties represent 20 percent of the area of Florida, but they furnish 64 percent of the school enrollments of 900,000 children. This means there is an average of 54 children per square mile among this group of counties, although the counties themselves are scattered to various points around the State.

Of the remaining 58 counties which do average an area of 750 square miles, we run an average of 7 pupils per square mile. This has tre-

mendous implications to needs in special education.

If, as a rule-of-thumb, you automatically said 10 percent of schoolage children deviate sufficiently in terms of some functional difference so that we must provide some unique educational plan in order for them to achieve, it means that 10 percent of 7 pupils per square mile cannot be handled in any way similar to how you would handle 10 percent of 54 children per square mile.

Our teacher-training programs that are tops in the Nation now grew up in metropolitan areas where they had hundreds of children

with similar kinds of problems to deal with.

I think one of the most urgent needs we have in the South, and I know this is true in the Mountain States where I worked for 4 years at the University of Utah, is the need to improve not only the quantity of service but the quality of service to youngsters in nonmetropolitan areas. The need to break through into new frontiers, new ways of organizing our special education services, new forms of service, are necessary.

In Utah, for instance, we are averaging only six children per square mile throughout the State. So here you have a different problem.

It also challenges us to a point which the previous gentleman referred to, the need for much fuller communication and cooperation in all the seven forms of special services that are concerned with exceptional children, not just special education teachers as such. This is another demand that we are feeling a tremendous need for.

We can have an excellent beginning in the South, and as it happens it relates to teacher education, the idea of regional planning, having surveyed the South to find what were the needs, and then recognizing that not every institution would be warranted in setting up a program, but, rather, to determine which would lend itself most easily to move into this and not drain off energies, the few personnel there were, and so forth, to concentrate in these programs.

We need a great deal more of this kind of thing, not only in relation to the teacher education aspect of it, but all other aspects, not only at the regional but at the State level and within the State within the county, within the community.

Our State universities should be looking at each other in terms of "What do we have that can supplement what you have?" How can we make the most of what we have, because there are too few?

In this connection, I would like to move to the very specific kind of needs that we are feeling at the Florida State University, not necessarily because they are unique, except that our teaching trainer program is perhaps presently unique in the Nation.

We have broken down the pigeonholes. We are not training teachers in any specific area of exceptionality. We are training teachers for exceptional children because that is the way we find them in the nonmetropolitan areas. We do not find clear-cut classes with only children with intellectual handicaps and so forth. So we have moved to a comprehensive training program, starting it 18 months ago. Give us 3 more years and we will brag about it.

Now we are just whispering. But in this connection we are saying the same thing to everyone who will listen to us. We need personnel. We can be specific in terms of how we need them, but I would rather

move onto another point.

We need demonstration centers, actual facilities. Not only are they needed, as the previous gentleman indicated, but they are essential in our training centers where we can at least show and demonstrate what could be possible out in the other counties, and so forth.

We need material production of various sorts to help us in teacher training. This is not disregarding the need actually out in the special education situations themselves. Of course we need scholarships and fellowships. The excellent start that was made with Public Law

85–926 is a heralded beginning.

On the other hand, we must not overlook the fact that graduate students don't just spring up from seed. They come up out of undergraduate programs, and we need help with our undergraduate programs because the cost of training a special education teacher at the undergraduate level is greater than the cost, let's say, of training a straight elementary teacher.

We had 20 undergraduate majors a year ago at Florida State in the field of special education. We have just put them through the last 2 years of what eventually will be a 4-year program, and we are running cost data now on the excess cost of training, at undergraduate

level, a teacher in the field of exceptional children.

Of course, there is the constant need for experimentation and research. These are not new things. You have been listening to them now at three different points in the country, plus all the correspond-

ence I am sure you are encountering.

I was not able to be here this morning. I recognized from some earlier remarks this afternoon that Dr. Dunn apparently took a stand; you refer to it as ideal and I, too, shall be guilty of being an idealist, but a persistent one.

I think to meet the last point on which you invited me to speak, specific suggestions on which I can help you, that you as a committee,

and you, particularly, Mr. Elliott, have the know-how. You have already done the job. You have made your own pattern for how you

can help us best.

As you reviewed the testimony, you recognize that each of us more or less represents a particular area of exceptionality, and this is what we are fighting for. But as you read across the lines, we are not disagreeing with each other, we are not saying "We don't need this, you just need mine," but we are just all bombarding you with our needs.

I recognize and appreciate what you say in terms of the legislative mind, but you have already done this job once. Do it for us again. Think through the things we have asked you for and others will be asking you for and go down the 10 acts of your NDEA. They are

all there.

We want fellowships as in your title IV: we want differential diagnosis, which is a carrythrough and beyond of your guidance counseling services in your title V. We want research. We want informational services; we want improvement in administrative patterns and data processing and so forth.

You have the pattern. Write it up this time for exceptional chil-

dren. Give us a national defense act in special education.

Your NDEA bill has been referred to as the Canaveral of education. Give us a bill of rights for exceptional children.

Mr. Elliott. Thank you very much.

Our next witness is Dr. Warren B. Weil, physician, of Birming-

ham, Ala. Is Dr. Weil here?

If he is not here, we will pass on to Mrs. Venoa Daniels, of the Alabama Nursing Association.

You may proceed, subject to a terribly arbitrary rule of 10 minutes.

STATEMENT OF VENOA DANIELS, COMMITTEE MEMBER, LEGISLA-TIVE COMMITTEE, ALABAMA STATE NURSES' ASSOCIATION

Mrs. Daniels. Thank you.

Mr. Chairman and members of this committee, I am a member of the legislative committee of the Nursing Association of Alabama. I am not the chairman. Therefore, I have a prepared statement. If I may, I would like to read this statement.

Mr. Elliott. You may.

Mrs. Daniels. Although the nurses association is not directly involved with the proposed legislative bills, House Joint Resolution 494 and H.R. 3465, and we are not speaking regarding testimony for or against these measures, we would like to be heard regarding our support of any proposed legislation in the fields of special education and rehabilitation. Nurses feel they have an important stake in these areas.

Because of our interest in the groups that can be helped and because of the numbers of special nursing problems which might result in the care of the handicaped individual, murses in this State, as well as nurses in other States, are interested in helping to alleviate these problems. We recognize that many disabled persons are in need of

nursing care and, as their need for nursing care becomes less, other needs may become greater.

We would like to go on record as being willing to support legislation that will help the handicapped individual sufficiently to allow

him to return to a more normal pattern of living.

We would also like to place emphasis on the educational aspects; more trained personnel—qualified teachers, therapists, and so forth. Wherever the handicapped people are, provision for the best diagnostic evaluation of the handicapped, full use of present facilities, with new facilities added where needed—avoid duplicating facil-

ities—so the handicapped can be educated to do something.

As an individual citizen, myself, I have looked at the outline, and if I may make a statement on my own, I certainly would like to say: You have spelled out many of the illnesses and diseases that affect the human being, for instance tuberculosis. All of these are greatly important, you have something here where my statement could come under "others and rehabilitations," but I still would like to say, as an example, cardiac patients, because heart attacks have no respect for age today. That individual needs help at the bedside today in regards to his employment back into society.

I thank you for the time before this committee today in behalf

of my association and myself.

Mr. Elliott. Thank you very much.

At this time the committee will take a 5-minute recess.

(Brief recess.)

Mr. Elliott. The subcommittee will be in order.

I am happy to note that in our midst is Mr. Plunkett, the resident chancellor of the county. We are happy to have him with us this afternoon.

Our next witness in Marvin P. Mantel, director, the Success Shop,

Montgomery, Ala.

STATEMENT OF MARVIN P. MANTEL, DIRECTOR, THE SUCCESS SHOP, MONTGOMERY, ALA.

Mr. Mantel. Mr. Chairman and members of the committee, I will implement that title by saying that I am the director of the Success Shop, which is the vocational rehabilitation workshop for the handi-

capped.

It is a privilege to meet with members of the Subcommittee on Special Education to give support to the H.R. 3465 sponsored by Congressman Carl Elliott. I am familiar with the general provisions of the bill and should like to comment on the part dealing with workshops

and rehabilitation facilities.

We approve the provision in the bill to provide for Federal grants to nonprofit agencies or organizations to pay part of the cost of building workshops and rehabilitation facilities. It should continue to provide for expansion and improvement of workshops and facilities now in operation.

It should further provide for the equipping of buildings and also a

program of diagnosis.

We also would like to see grants to State agencies administering State vocational rehabilitation programs, to pay part of the cost of

rehabilitation services to severely handicapped individuals who can be helped to achieve reasonable self-sufficiency in meeting the normal demands of daily living.

The most frequently used services in workshops are:

(1) vocational diagnosis and evaluation;

(2) vocational and personal adjustment training;(3) vocational training; and

(4) continuing employment.

Workshop personnel are ready to admit that the workshop staff must be adequate in number, and will demand professional staffing either as an integral part of the workshop or on a coordinated community plan.

We need Federal participation in initial staffing beyond the present

1-year provision of Public Law 565.

One of the greatest services workshops can render is evaluation and diagnosis. This program is now being carried out in a small scale. We know there is a great need for expansion of this program. Although much specialized diagnosis and evaluation, together with a thorough testing program, may precede admission to the workshop, continued diagnosis and evaluation are necessitated. Breakdowns and failures are not always vocational in origin. Evaluation should continue under the work situation.

The effect of work upon physical, social, and emotional conditions, and these conditions upon work, need to be known and evaluated. Only by a long and sometimes painstaking program of evaluation can we determine whether sheltered workshop training can rehabilitate mentally retarded young adults or other individuals with great limitations whose employment had previously been considered impossible.

It is our opinion that we must move more vigorously in the direction of reducing our expenditures for public assistance by preventing dependency. We believe that democratic principles are, in essence, humanitarian; therefore, as understanding and vision grow, the concept of the greatest good for the greatest number expands without losing the focus on the rights and privileges of the individual.

The greatly increased activity in the field of legislation is one important evidence of the respect of human life and the dignity of the

individual which is basic to the American way of life.

We believe that community nonprofit organizations can best carry out a comprehensive evaluation program through the establishment of well-equipped and well-staffed workshops. We must have adequate and suitable buildings, suitable staffing and equipment. This staffing should include instruction in remedial work for those whose education is so limited, that it will require additional general education for them to learn the basic skills in accordance with vocational aptitudes.

Thank you.

Mr. Elliott. Thank you very much, Mr. Mantel.

Are you related to B. G. Mantel?

Mr. Mantel. I happen to be a brother.

Mr. Elliott. I am happy to meet you and happy to have your testimony.

Mr. Mantel. Thank you, sir. I enjoyed being with you.

Mr. Elliott. Our next witness is Judge Bernard A. Reynolds, the probate judge of Dallas County, Selma, Ala.

May I say, Judge Reynolds, we are happy to have you. You may proceed in any manner that you desire to give us your testimony.

STATEMENT OF HON. B. A. REYNOLDS, JUDGE OF PROBATE, DALLAS COUNTY, ALA.

Mr. Reynolds. Thank you, Congressman.

Congressman Elliott, members of the committee: It is certainly a pleasure to be here, and I appreciate the privilege of being given this

chance to testify.

I have read the bill and the resolution concerning vocational rehabilitation and special education, and I would like to support this program as a whole. One part I would particularly like to discuss is on the bill dealing with expanded rehabilitation services, including workshops and facilities.

Mr. Elliott. Judge Reynolds, let me ask you: Alabama has not scratched the surface in building workshops for our handicapped people that we are trying to train through special educational pro-

cedures. What is a practical approach to get that done?

Should we have some Federal aid for that type of a building pro-

gram or how should we approach that?

I ask you that as one of Alabama's leading citizens and as the chief official of one of our leading counties. If you do not want to answer now, I want you to think about it and write to me about it, giving me

your thoughts about it.

It seems to me, and you and I do not think far differently about these matters, that there are fields, such as maybe the one we are talking about, in which the Federal Government can act as a sort of catalyst—if you speak of it in chemical terms—to help get one of these programs underway. I wish, and I have made this statement many, many times, that it were possible that we in Alabama could do every one of these things for ourselves and still have plenty of money left over to do the other things that we need to do. But we are in a constant strain, so to speak, to get the money with which to do many of these wonderful, worthwhile things, that ought to be done. You think about that sometime and let me know how you feel about it.

Mr. REYNOLDS. Thank you, sir.

I would like to write you in regard to that, Congressman. I think it is nice that you have asked me to do that. I certainly will give it thought and let you hear from me.

We do need some Federal help. I think it should be planned.

To digress just a moment, we in Selma, Dallas County, have built a workshop. It was done through the Civitan Club and local help. We have a facility there that I think is second to one, only in size, and one that we are very proud of. We would be proud to have you and your committee come and visit us and see what we have been able to do with some help through rehabilitation. The rehabilitation program has been the one to spur it on.

It would like to say that the Civitan Club and the Lions Club of

Dallas County have done a wonderful job.

Mr. Elliott. How many do you accommodate through this program

in Dallas County?

Mr. Reynolos. We have a regular training program where we are able, at the present time, to train around 50 constantly under a train-

ing program in this workshop, in bookbinding, upholstery, woodwork, printing, and through the fact that we have some wonderful people on social security there, who are really well-trained men, we can afford the best as our teachers.

Mr. Elliott. You are certainly to be commended on that accom-

plishment in Selma.

Mr. REYNOLDS. Don't give me credit for it, please, sir. It has been done without me.

Mr. Elliott. I have an idea that you have been helping it along as the years have gone by.

Mr. REYNOLDS. Well, I had a little part that I am very proud of. I think it is wonderful that I was asked to help on it.

Mr. Elliott. Thank you, sir.

Mr. Reynolds. I have been closely associated with, and in fact a part of, the total rehabilitation effort in my county by virtue of my interest and as chairman of the probate judge's committee on employing the physically handicapped. I have seen excellent community participation and remarkable rehabilitation results.

I have also been aware of severely handicapped individuals who

could not be rehabilitated due to lack of funds and facilities.

It is my belief that communities should be allowed to raise money which would be matched by Federal funds, subject to approval of the State rehabilitation agency, not only for construction of facilities and workshops, but for their expansion and improvement. This should include equipment and staffing on a continuing basis, with Federal funds being matched locally.

I believe that facilities should include halfway houses for the mentally ill, mentally retarded, and that special education classes for upper-age children should be established in approved rehabilitation facilities and workshops, with staffing provided by Federal funds on a

continuing basis as above.

I have been advised that surplus equipment has been denied rehabilitation facilities and workshops. It seems to me that no group could better utilize this equipment, since the prime purpose of these facilities and workshops is to evaluate, train, and employ disabled people.

I recommend that this provision be added as an amendment to the

Rehabilitation Act of 1959.

There are other factors I could mention, such as the need for additional staffing of trained personnel in rehabilitation and related professions, such as psychiatric social workers, therapists, et cetera. These points illustrate the need for an expanded program in the fields of rehabilitation and special education and I submit them for your consideration.

Thank you for permitting me this opportunity.

Mr. Elliott. Thank you very much, Judge Reynolds. We are very

happy to have had you.

Î recall, myself, your interest in this field is of long standing and that you served on the Alabama Commission for Mental Health, did you not?

Mr. Reynolds. I still do; yes, sir.

Mr. Elliott. I knew at one time you served on that commission.

I want to congratulate you on the program that you are getting under way in Alabama for our mental health program. I think it is a great advance over what we have had.

Mr. Reynolds. Thank you, sir.

I certainly hope we will be able to put over amendment No. 1 on our constitutional amendments on February 16 in regard to the \$3 million bill, which will not increase our taxes.

Mr. Elliott. I hope so, too.

Our next witness is Miss Irene Perkins, of the American Occupa-

tional Therapy Association, Dublin, Ga.

If Miss Perkins is not here, then our next witness is Jasper Harvey, coordinator of education for exceptional children, University of Alabama.

We are happy to have you, Mr. Harvey. You may proceed as you choose, subject to our usual time limit.

STATEMENT OF JASPER HARVEY, COORDINATOR OF EDUCATION FOR EXCEPTIONAL CHILDREN, UNIVERSITY OF ALABAMA

Mr. Harvey. Thank you, Congressman. It is a pleasure to be here

with you and to have an opportunity to testify.

I feel that since we have gotten into the area of exceptional children from a teacher-training level, a little late in Alabama, that possibly in outlining some of our urgent needs in the teacher training level I can speak in an area with which I am more familiar, since I am relatively new to Alabama, but not to the South, however.

I think, to be realistic, we have to realize that the individuals whom we train at the University of Alabama aren't necessarily going to stay in the State of Alabama, so what I am saying applies not only to us here in Alabama, but in the South as a whole, and, actually, the

whole country.

We need a program similar to Public Law 85-926 that will go into the areas particularly of neuromuscular and orthopedic disabilities and the allied areas of physical therapy and occupational therapy.

In the city of Birmingham there are only 10 registered physical therapists. If you are going to staff classes for children who have orthopedic difficulties, we are going to have physical therapists.

Another need as far as our program in Alabama is concerned is school psychologists, not from the standpoint of clinical psychology, but school psychologists for screening our children. Of course, the area of the gifted is not being touched.

The second thing we need is an increase in the number of fellowships and supporting grants which may be allocated to each State

under Public Law 85-926.

In Southern States, as in Alabama, teacher training programs at the university level are either new or nonexistent, and the demand for trained individuals is great. Consideration of similar legislation which would have as its objective the training of teachers of retarded children would help to alleviate the acute shortage of trained teachers in classrooms for the educable mentally retarded in Alabama.

The 1958-59 educational status for all teachers of exceptional children in Alabama was as follows:

Master's degree: 33, or 13 percent.

Baccalaureate degree: 161, or 61 percent Total number with degrees: 194, or 74 percent.

Three years' college: 16, or 7 percent. Two years' college: 27, or 10 percent. One year's college: 25, or 9 percent.

Total number without degrees: 68, or 26 percent.

In regard to the professional status of teachers, there is a limited number who have degrees in the whole specific area of special educa-

tion in which they teach.

At the present time, the State department of education, through State Superintendent of Education Frank R. Stewart, and in cooperation with the State Committee on the Education of Exceptional Children, Mrs. Alpha Brown, consultant, Program for Exceptional Children, and the Bureau of Educational Research, University of Alabama, is in the process of determining the educational and professional status of teachers presently employed as teachers of exceptional children in the State of Alabama. A copy of the questionnaire is attached.

(Questionnaire referred to follows:)

AN INVESTIGATION TO DETERMINE THE EDUCATIONAL AND PROFESSIONAL STATUS OF TEACHERS PRESENTLY EMPLOYED AS TEACHERS OF EXCEPTIONAL CHILDREN IN THE STATE OF ALABAM.

This EDUCATIONAL AND PROFESSIONAL STATUS STUDY is being done through the State Department of Education in cooperation with the State Committee on the Education of Exceptional Children, Mrs. Alpha Brown, Consultant, Program for Exceptional Children, and the Bureau of Educational Research, University of Alabama.

As a part of this study, the transcript of each of the 305 teachers of exceptional children employed in the state during the 1959-60 achool year is to be checked for specific course work in the areas of special education. Your cooperation isnecessary for completion of this study.

Dear	
	low whether or not you have had additional course work since credits was sent to the State Department of Education for

V. MATERIALS OF INSTRUCTION

List special equipment and types of materials of instruction available to your class. Describe in terms of major categories such as books, audio-visual aids, art supplies, etc. (If nocessary, use back of this sheet to complete listing.)

EMERGENCY PROGRAM TO PROVIDE OPPORTUNITIES FOR TEACHERS NOW WORKING IN SPECIAL EDUCATION TO BECOME BETTER QUALIFIED

Objective: The general objective of the program would be to provide expert help and instruction for teachers now serving as classroom teachers of the mentally retarded and multiple handicapped.

Scope of program: The scope of the program would be statewide in that the State would be divided into areas for the offering of course work which could be used toward a degree program. Such areas would be designated by committee or subcommittee decision. Program time: 3 years.

(1) Areas could be based upon AEA districts, and would be as follows:

White:
District 1, 25 teachers;
District 2, 5 teachers;
District 3, 28 teachers;
District 4, 20 teachers;
District 5, 77 teachers;
District 6, 29 teachers;
District 7, 29 teachers;
District 8, 41 teachers.
Negro:

District A, 26 teachers; District B, 18 teachers.

Designation of areas should consider the availability of plant facilities.
(2) Personnel should include a minimum of three full-time instructors plus one full-time secretary to coordinate the business affairs of the program. The inclusion of consultant service from recognized authorities in the various areas of exceptionality on at least a once per year basis is strongly recommended.

(3) Budgeted items should include:

(a) Salaries for three instructors whose minimum qualifications would be a masters degree plus experience in area taught. Ed. D. or Ph. D. degree level would be preferable.

(b) Salary for full-time secretarial help.

(c) Expenses, travel, and honorarium for consultants.

(d) Provision of library for each of the three instructors, plus consideration of similar libraries for those permanently attached to universities now offering programs and who, it is assumed, would be used to service areas.

 $(e)\,$ Maintenance and travel for three instructors, to include visitation in classrooms of teacher-trainees.

(f) Office expense, basic space and materials to be provided by the housing institution.

BUDGET (PROPOSED)

notone (9) minimum mulificationer Magtanla James mith actual

SALARIES

teaching experience in area(s) of special education taught, 9 months' salary.	\$
Secretary (1), fulltime, to serve instructors in the field, 12 months' salary	•
Consultants, minimum of 2 per school year (September-May) Other	
MAINTENANCE AND TRAVEL	
Per diem, at \$9 per day (proposed classroom visitation of each teacher-trainee once per semester)	\$
Travel, at 8 cents per mile (proposed classroom visitation of each teacher-trainee once per semester)	
Other	
	\$

OFFICE EXPENSES

Drawisian of office space and usual office supplies and expanditures

to be provided by the housing institution. Additional equipment and expenditures	
Other	
LIBRARY	
Due to the nature of the program, each instructor would need a library facility which he could take with him. There would be an initial outlay for each instructor with provision for additional pur- chases as needed and as new materials become available.	

Total projected cost per year: \$49,166.

Mr. Harvey. The mentally retarded child accounts for approximately 71 percent of all children in special classes in Alabama for the current school year.

In Alabama the need is for:

(a) Fellowships for graduate level study and for supporting grants to institutions which will allow a building up of the professional group. The problem is not one of replacing people; it is the very real problem of initial placement.

(b) Undergraduate fellowships for the third and fourth undergraduate years to aid in recruitment and training of teachers for

the mentally retarded.

I think some of the people in professional education are beginning to call this the retread program of taking people who have gone through a regular 4-year program either at the elementary or secondary level and then superimposing training in the area of special education, or a certain area. We must start at the undergraduate level.

(c) Additional classes in the public schools. There are an estimated 100,000 exceptional children, ages 6 to 20, white and Negro, in Alabama. Of that number, some 4.6 percent now are being pro-

vided noninstitutional special education.

Mr. Elliott. Let me get that point, Mr. Harvey.

We have 100,000 exceptional children in Alabama, and we are providing a program of special education for 4,600 of them; is that right?

Mr. Harvey. That is right, 4,600. Three thousand and seven hundred of those children are in classes for retarded children; 900 of them are in other categories, mainly physically handicapped.

Mr. Elliott. So when we brag on ourselves about what we are accomplishing and look at it from the standpoint of the fact that we are serving less than 5 percent, we have a good, long way to go, haven't we?

Mr. HARVEY. We have a tremendous way to go.

I do feel, though, that Alabama has done a wonderful job, I think I can be objective about this since I have just come to Alabama, a better job than most people give us credit for having done, because

other States that have been in the program for a number of years, 10 or 15 years, are servicing no more than 8 to 10 percent of these children.

Mr. Elliott. What is the national average of educational service

to exceptional children?

Mr. HARVEY. Well, it would vary, of course, from State to State, but I think on a national level we would not be talking much more than 12 to 15 percent. I do not know that I have ever seen this figure, but it is low.

Mr. Elliott. You would estimate that the national average would be 10 or 12 percent, and in Alabama we are doing about 4.6 percent?

Mr. Harvey. Yes, sir.

The problem of additional staff at the State level has been mentioned by a number of people who appeared before the committee, but I do think we do need additional people both as supervisors and to serve as consultants in the various areas.

The one individual at the State level has done a very creditable job,

but you can't do all of it by yourself.

(d) Additional staff at the State level; both to provide supervi-

sion and to serve as consultants.

(e) Building needs are great. There is need for funds to provide special wings and/or rooms to provide adequate facilities for exceptional children.

(f) Transportation needs in the rural areas and for crippled chil-

dren are not being met.

Dr. Neil referred to this as one child in one community and another in another community. This has been run into before and it is a very difficult thing to handle.

If a good transportation system could be worked out for cooperative programs, we can service these children even in a State as basi-

cally rural as Alabama.

I think one thing that has not been mentioned is that on the positive side the State department of education has taken a step that no other State has taken. There is a State committee which has begun a plan for coordination of the State institutions of higher learning, namely, the two universities and the four State colleges.

This program of teacher education for exceptional children is an expensive thing. We have to face that, that it is expensive. the securing of the trained staff is even more of a problem here.

is recognized and steps are being taken.

I think some very basic agreements which have just recently been reached will allow us to coordinate our training program and come along from that level. If we get a little help from the Federal Government, such as Public Law 85-962, we are going to make some real progress in Alabama.

Thank you.

Mr. Elliott. We need to expand that public law for the mentally retarded so as to get a training program under way for all these categories for teachers, do we not?

Mr. Harvey. We surely do.
Mr. Elliott. That is the bare minimum.

We are spending \$1 million a year to get this program started for the mentally retarded. Maybe this is not a fair question for you, but do you have any estimate as to how much it would cost to expand that teacher training program sufficiently to begin to train teachers for all categories of these special educational needs?

I do not know, myself, what it would cost. I have an idea that the figure would be fairly significant, but certainly something that we

have to do, as I see it.

Mr. Harvey. I really would not know how to estimate that. I think that we have been pointing out this thing of recruitment as being a real problem. The people who come to my office almost daily and discuss interest in the area of exceptional children have families, they are tied up in situations, and fellowships will help us here. The people are interested if we can work through something at this level.

Mr. Elliott. Thank you very much, Mr. Harvey, for your kind

testimony.

Mr. Elliott. Our next witness is Douglas Carter, exceptional child chairman of the North Carolina Congress of Parents and Teachers, Charlotte, N.C. Is Mr. Carter here?

If not, our next witness is Mrs. Joan S. Bergman, chief therapist, physical medicine department, University of Alabama Medical Center, Birmingham, Ala.

We are very happy to have you, Mrs. Bergman, and we are anxious to hear what you have to testify to us. You may proceed as you wish.

STATEMENT OF MRS. JOAN S. BERGMAN, CHIEF THERAPIST, PHYSI-CAL MEDICINE DEPARTMENT, UNIVERSITY OF ALABAMA MEDI-CAL CENTER, BIRMINGHAM, ALA.

Mrs. Bergman. Thank you.

I have been invited here today as a representative of the qualified physical therapists here in Alabama. I am afraid I am going to do what Mrs. Thiel has said. I am going to bombard you with all of our needs.

I think the best way to tell our story is to take a look at the overall

picture here in Alabama.

In 1958, the State of Alabama had a population of 3,220,250. According to our national standards, there should be 1 physical therapist for every 10,000 people. This means, of course, that there should be 322 therapists working full time in Alabama. There are 41.

Mr. Elliott. 322 and we have 41?

Mrs. Bergman. Several of those are working part time.

Mr. Elliott. And when you take the 7 part time off, we have 34; is that right?

Mrs. Bergman. Yes.

To become even more specific, Birmingham, proper, has a population of 378,000, and Metropolitan Birmingham has a population of 640,000. This would give us enough work to keep 64 therapists busy. We have seven working full time, three part time, and one who travels and is in the area part of the time. Actually, there are only three centers of physical therapy in Alabama. These are in Birmingham, Montgomery, and Mobile.

Any person who happens to live in an outlying area, must either travel to one of these centers for treatment or go completely without

the care that they deserve.

Mr. Elliott. Let me ask you this question, Mrs. Bergman: The trend in this country now is to build everything in the centers of population. They say that if you need a hospital that is any size, that it ought to go to Birmingham, in our State, and if you need the specialities, the special type hospitals, that they ought to be built around the medical center.

I know you will pardon me if I inquire, and you may not be qualified to answer this question, how folks out here in the hills that are anywhere from 120 miles to 40 miles away are going to get the benefits

of those services that are concentrated in the cities.

I do not know what the solution to it is myself. We have a good program of building small Hill-Burton hospitals over our State, but now the Veterans' Administration, for instance, I have heard officials of the Veterans' Administration say that if you build a VA hospital in the small town, you cannot induce personnel to come to the small town to operate the hospital.

It seems to me that if you follow that line of thinking right to its logical conclusions, before long we are going to all finish up in the

city. I think there must be some other solution than that.

Mrs. Bergman. As far as physical therapy is concerned, I believe there should be big rehabilitation centers in your larger places, in Birmingham, Montgomery, where people can come and stay and get intensive care. But this does not take care of physical therapy.

Each hospital really needs a department. Each person who has a simple knee operation deserves maybe one or two treatments. Then

they would have a good knee.

We need therapists in all of our small places and then more and larger facilities, too. We don't have the therapists to put out in the small places.

Mr. Elliott. In the cities you do not have enough to divide with

the rural areas, do you?

Mrs. Bergman. We do not have enough for our cities. I know in Florence, last year, they raised quite a bit of money to equip a physical therapy department. I worked with them on this. The whole community was very enthused. They raised the money, they equipped the department, and they have not gotten a therapist yet. So it is wasted. This has happened in several places. I hope that we can help them staff it. We keep trying.

I would like to tell you about my own department. It explains a little more about the State as a whole. This is the physical medicine department of the university hospital, which is a part of the University of Alabama Medical Center. It was reopened for patient care on January 3, 1956. Prior to this date there was no facility for the care of the general public in Birmingham, which, again, is

a city of 640,000 people.

In our department, we render care to all patients, whether they

be private, part-time, agency, or indigent.

In the 4 years that we have been open, we have treated patients from 57 of the 67 counties in Alabama, and from 10 other States.

We started by giving 4 treatments the first week and now we average

slightly over 100 per week.

While this is a very small beginning in physical medicine, we feel that we have made a significant contribution to the rehabilitation of many people.

These last facts sound very good to us, we are very proud of them.

But will we continue to grow?

Our problems of course go back to the supply and demand that you always run into. Our first problem is the demand or the education of the public and the physician to the importance of physical therapy. You see, the word "rehabilitation" means something only to those who understand the well. We are slowly overcoming this problem.

Using our own department as an example, we have had 149 different physicians prescribing treatments for patients. This number continues to grow slowly, but it is a steady growth. Little by little with the existing department showing what can be done, more physicians are requesting treatments for their patients. Having a facility utilized to its full potential is a problem, but one which we can tackle on the local scene. Handling the other phases of the problem is a bit more difficult.

It is a gross understatement to say that there are not enough facilities offering treatment in physical medicine. Certainly we hope that the Government will not cut down the funds available to help build these centers. Even if we were to get these centers, we would still have the shortage of personnel to contend with. More scholarships and more grants for the training of therapists are needed, but I do not see how we can really alleviate this shortage until we begin training qualified personnel here in our own vicinity.

In the past 5 years I have seen many people recruited and counseled, and have seen them go off to school to study physical therapy. There being no school in this part of the country, they must go away for

training. Only one has returned.

Mr. Elliott. Where is the closest physical therapy school?

Mrs. Bergman. The closest one is in Columbus, Ohio, 475 miles from Birmingham.

Mr. Elliott. The closest one is 475 miles away?

Mrs. Bergman, Yes.

The next two are in St. Louis, and they are 490 miles from Birmingham. We don't get them back. They see other parts of the country and stay.

Mr. Daniels. Why is that?

Mrs. Bergman. Physical therapists are a very wandering bunch. I think the main reason is there is a demand for them all over the country, just as there is here in Alabama.

Mr. Elliott. You mean our northern neighbors can pay them more

money.

Mrs. Bergman. No, but if you have a southern person and you send them away, they decide they would like to see Seattle, maybe, and they can always go any place in the country and work for a year and then go some place else and work for a year.

The physical therapists travel. Our national association cannot keep up with the ones that roam around. They are supposed to be

the most roaming professional people. So you can see that we feel we must have a school here.

If we can keep them here and train them here, it would be better. The University of Alabama Medical Center is an ideal location for a school. This is not only my opinion and the opinion of the personnel in the center and of the therapists in Alabama, but this is also the unofficial opinion of the executive staff of the American

Physical Therapy Association.

I will have to admit this: Physically, our department consists of seven rooms in the most deplorable condition. We would have to have a better facility if we were to train top-notch therapists. We will not go into the training of therapists until we can be sure that we will be turning out good ones. Of course, we need classrooms and teaching equipment.

Before leaving, I would also like to say that as a member of the rehabilitation team I cannot express strongly enough my hope that the independent living bill will be passed. We see patients every day that would benefit from this and who deserve the care that it would

provide.

Mr. Elliott. I happen to be, by virtue of these people electing me to Congress time after time, one of the people who passed Public Law 565, and I thought that it made a very great contribution in that field. That was in 1955, I guess, or 1956. But I think that our experience under that has taught us, plus the growth in the spirit of our general thinking about our human needs, that we have to do something else in that field.

My independent living bill is my approach to that, but I am looking for suggestions constantly from people like you, whereby we can im-

prove upon the structure of that bill.

I am glad you think it is good.

Mrs, Bergman. I do.

Mr. Elliott. Thank you so much. Mr. Daniels. I have one question.

Your testimony indicates you have given this subject quite a great deal of study. Have you formulated any opinion as to how much it would cost to fully equip a first-class therapy laboratory clinic?

Mrs. Bergman. Well, I wouldn't let my boss come down with me. I have floor plans drawn for every place in the hospital. If they

say, "You can move to the second floor," I have the drawing.

We are hoping to be renovated and moved into a new part of the hospital soon, and we are working on lists of costs of equipment, including teaching equipment and renovation so that we would have a nice facility. This, incidentally, would be the beginning or nucleus. The long-range program would consist of this department of physical therapy. It is called the physical medicine department, but it is only physical therapy.

In our budget we already have room for occupational therapy as soon as we can get floor space. Then the medical center is planning an ambulatory patient center and we would have a regular rehabilitation center there, with all of the different parts of physical medi-

cine and, of course, physical therapy in the center.

Our little department that I am planning now would serve for the inpatients and for the beginning of the teaching. A very rough esti-

mate, and we have not finished our lists yet, would be that it would cost us somewhere from \$30,000 to \$40,000 to set up just the inpatient

department in the hospital.

Mr. Daniels. I do know that back home in my county we have a mental disease hospital which 2 years ago installed a physical therapy department just for the inpatients of the hospital. And, if my recollection served me correctly, it cost about \$40,000. It is supposed to be one of the most up to date and efficient therapy departments around.

Mrs. Bergman. I wish we had it.

Mr. Elliott. Thank you very much.

I see my friend Raymond Higdon in the room. He is the county tax collector. He knows all about rehabilitation and is interested in it.

We are glad to have you here, Raymond, to show your interest.

Our next witness is Miss Virginia Dobbin, from the recreation department of Bryce Hospital, Tuscaloosa, Ala.

Miss Dobbin, we are happy to have you.

STATEMENT OF VIRGINIA DOBBIN, RECREATION DEPARTMENT, BRYCE HOSPITAL, TUSCALOOSA, ALA.

Miss Dobbin. I am here as a representative of the consulting service on recreation for the ill and handicapped of the National Recreation Association, with regard to their interest in the bill for independent living.

This is very close to the heart of recreation people because we do live in a social world, and all of our relations are social relations.

The way we interpret the world comes from the way we have built up our own idea of self and our own idea of self comes from what other people think of us, or what we think they think of us.

So self becomes the frame of reference for each person. Because the world and other people are interpreted in this manner and understood in this manner, it becomes a social concern that we build

up desirable selves in each person.

One of the great fallacies in thinking is that all men are created equal, free and equal. It is quite apparent from birth on there is a great difference in individuals, and then due to various things that happen other differences enter.

When a step is taken to provide equal opportunity, effort must be made to relate the opportunity to the variances in capabilities. We feel that the bill for independent living is the chance for doing

this.

When we speak of handicapped individuals who are we talking

We usually think first of the orthopedically incapacitated person. But then what about Franklin Delano Roosevelt. We think of the deaf, but what about Beethoven?

Old age has entered into the picture and becomes a problem.

What about Grandma Moses, 99, painting world famous landscapes. One of her paintings just recently sold for \$3,400.

But these are the fortunate ones, the ones who are able to accept themselves.

What we have to do in our job is to reach out to these others who have not been able to accept themselves and help themselves to reach the same goal, not world fame, but a place in the world, the world of people.

The disabled have a very deep need for acceptance and understanding, because they rely so much on other people they develop a very sensitive reception to what the person is thinking about them.

The road to independent living is a mighty long one. It seems that up to now we have tried to play the old game of giant steps to get to the end of it, which is vocational rehabilitation.

Now, we have to go back and pick up the ones that we left along

the roadside. How can we help?

Well, as a representative of the National Recreation Association, I would like to point out three large areas that we feel recreation could

help in.

In playgrounds and other recreational facilities equipped to care for the handicapped child, insofar as I have been able to ascertain, there are no public playgrounds within the State to train leadership in specialized equipment to provide this service.

What could this mean to the child?

Well, the most enduring need of a child is the need to be loved, to belong, to give and to receive, to cooperate, and to be accepted by his own age group.

This applies to the deaf child, the one with cerebral palsy, the blind, the lame, and the mentally retarded as well as the normal.

But could they find this today?

Another large area is in hospitals. From a study conducted by the National Recreation Association in 1958, we find that there are, in Alabama, 129 hospitals that are registered with the American Medical Association. Out of these 129 hospitals, 19 have organized recreation programs with professional staffs.

In speaking of hospitals, most people think of the general hospital. Here we find the child so often full of insecurity at being away from home for the first time, with all the unfamiliar hospital routine. How much the family play patterns could do to allay his fears. Play periods bring relaxation, relief from pain, and a minimum of crying.

To an adult, convalescent means a major change in his pattern of

life and his way of meeting needs.

The hospitalized person has a world that becomes small, and he becomes self-centered, he needs activities to draw him away from self.

Many realize that due to the nature of their illness they will not be able to continue some of the hobbies and sports that once filled their leisure time. This could be a time for finding new interests and new skills with the help of trained leadership.

The child or adult in a TB hospital faces a long period of hospitalization with the need for relaxation of paramount necessity. This is at the very time when all the activities which filled his day have suddenly ceased. Relaxation is an art and not many persons have become skilled in it. It can be encouraged through music, art, reading, learning new skills.

The child, even though he is in a TB hospital, needs to experience in a limited way the same experiences that are common to his age

group.

The adult must have creative and social experiences related to the

happenings in the world.

The same holds true for the orthopedically incapacitated patient. Not just a problem of arms, legs, and backs. It is the problem of the whole person, because human movements are the principal outlet for energies, the tensions are high for the disabled who are inactive.

Then, of course, to me the big field of hospital recreation lies in the mental hospital. Here we find the person who, regardless of the type of illness, has failed in social relationships. This means that the recreation personnel are challenged to provide activities that are not just pastimes, to fill the waking hours and break the monotony of hospital routine, but which are the means of providing those linkages with life that H. A. Overstreet talks about in "Mature Mind," helping him find new knowledge about himself and the world about him; helping him journey from irresponsibility to responsibility; helping him to become articulate, to escape a skin-enclosed suffocation.

The means of measuring this, of course, vary with the leader and

with the individual.

But in the recreation program within the hospital lies the chance for the patient to once more enter the world of reality and to take

his rightful place as a social being.

The third large area where recreation could mean a great deal is in the nursing home program. There is an article in February issue of the Altrusion magazine which tells of a project being conducted in Illinois. I am not sure whether you are familiar with it. I was not.

Here they found that 50 percent of the State's medical costs for public aid was being spent to maintain indigent oldsters in nursing homes. With assistance from the National Institutes of Health, the Illinois geriatric rehabilitation program was established, and at the end of the first 2 years, 80 percent of those selected had returned to community life.

The study showed that most older patients responded rapidly to psychological support, motor retraining, and medical treatment.

The more comprehensive the program, the more quickly the patient

is on his own again.

Yet in checking with the Alabama Nursing Home Association, we find there is not a home in Alabama with a recreation program or recreation personnel.

We as an association would stress the need for grants for, first, research to evaluate the possibilities of recreation for the ill and handicapped, and the best methods in the field.

Second, demonstration projects in the field; and

Third, visual material which will ring the bell and tell the people what can be done and how it can be done.

Mr. Elliott. Thank you very much, Miss Dobbin. Your testi-

money was very challenging.

Our next witness is Miss Roberta Morgan, of the Jefferson County Coordinating Council of Social Forces, Birmingham, Ala.

STATEMENT OF ROBERTA MORGAN, JEFFERSON COUNTY COORDINATING COUNCIL OF SOCIAL FORCES, BIRMINGHAM, ALA.

Miss Morgan. I appreciate this opportunity to appear before the committee.

I represent a community council made up of private and public agencies, with interested people who are interested and we make studies of needs in the fields of health, welfare, group work, housing, and make recommendations and plans to help carry out those services, and to coordinate services when we possibly can.

Mr. Elliott. To whom do your recommendations go?

Miss Morgan. They go to our board and then perhaps the boards of individual agencies, sometimes to the Community Chest board, if

it is to provide some money for some needed services.

They go to various places. They may go to a private foundation, where we think there is a possibility of getting some money for a needed service or for a demonstration service until such time as the Commuity Chest funds could be raised to provide that service in the community.

We also belong to a State conference informally organized and I think we have about 30 counties usually represented, of just ordinary people, some workers, private citizens, interested people, interested

in community services in their communities.

We were very pleased when we first got copies of this bill on rehabilitation and independent living. It was really fresh air.

We found it really dramatic, with possibilities.

We would like to present a little different side. We have to be comprehensive. We are interested in all phases of the different types

of agencies.

Mr. Elliott. Miss Morgan, before you begin your formal testimony about those matters, let me say to you that it has been my feeling all along that the greatest force in America for improving these things that we are talking about here, is the human interest right in America's precincts.

As we try to legislate, we must be careful, always, to preserve and give that personal interest on the part of the citizens a full expanse in

which to operate.

Miss Morgan. Yes.

Mr. Elliott. If we do anything, legislatively speaking, to kill that interest at the local level, then, as we say, we just spin our wheels: do we not?

Miss Morgan. That is right; legislation which is imposed without understanding or support of the people has very little chance of

developing really good acts for a long time at least.

There is a magic about the word rehabilitation. It inspires the average person in a local community to lend his interests, his time, and to give money toward helping disabled persons to realize some

of their hopes for independent living.

Many localities have established or, with encouragement will establish, such services for the chronically disabled as visiting nursing services, homemaker services, and perhaps under the visiting nursing sometimes called therapists, that being true in Birmingham now, on an hourly basis which can be provided free or purchased by individuals or by rehabilitation funds, perhaps, or some other agencies.

With encouragement, these local people use their initiative in

With encouragement, these local people use their initiative in establishing limited facilities and in organizing volunteers for services, even to the point of each one help one, help your individual neighbor, local communities are receptive to ideas of responsibility for sponsor-

ing demonstration projects, for developing self-help and independent living for its older citizens, if foundations or other funds can be

granted to supplement other local funds.

Any legislation provided for broadening and intensifying programs for rehabilitation, for independent living, where Federal funds will be available to States and thus to local communities, should have provision for a statewide advisory committee with broad representation of the various professions and lay members, and local committees and ad hoc committees in specific areas in the community.

Where there are already existing community planning councils these might serve as a sponsor for a local advisory committees on

rehabilitation or independent living.

These committees, local and State, would serve as a clearinghouse for applications for Federal funds for demonstration projects, for

workshops, and for facilities for evaluation and treatment.

There is a multitude of public and private agencies, national and local, associations and societies, which presently have limited authority, programs and funds for advancing the effectiveness of services to people who are disabled as a result of congenital effects, the effects of acute or chronic illnesses, or as a result of traumatic accidents.

These agencies and organizations have developed some valuable

research.

Medical specialists in dealing with certain diseases, other special personnel who serve the social and the economic needs of persons so handicapped that they are unable to live independently.

There is considerable imbalance as between the number of agencies and the funds provided for services for people in these categories, and surely as between people affected by different types of disabilities.

Have we come to the point where there is such competition for the public and private dollar and for professional personnel in short supply that the very people we are trying to serve suffer from the lack of coordination on all levels, Federal, State, and local communities?

The waste of money, scarce professional personnel, and physical facilities may increase unless stock is taken of what we now have, how we are using what we have, and what cooperative and coordinated programs can be developed.

Here and there, there are instances, particularly on the local level, of the beginnings of cooperative planning and program operation for

the chronically disabled.

Illustrations are: Comprehensive evaluation services, coordinated workshops—we have one in Birmingham which we are very proud of—and teams for the care and rehabilitative services for the homebound.

In Alabama the State vocational rehabilitation and the crippled children services have worked with local groups, really the ad hoc committees of community councils, in fostering cooperation and coordination in workshops, and in such programs as the aftercare and training of persons discharged from mental institutions.

It would seem a great advantage to have some trained generalists or community organization workers attached to the State rehabilitation agency for further experimentation and demonstration in this

area.

They have several people on the staff in Alabama who are dedicated and who have a good deal of skill in working with the local community groups, but they have so many other administrative responsibilities, or they are counselors, that the adding of some people who know about community organization to really work in the field, in the State, as representatives, might be quite advantageous in considering the legislation under consideration and carrying it out, furthering it.

Do we not have the unprecedented opportunity for the Federal Government to provide legislation and funds not only to demonstrate, but to establish coordinated programs by involving, but without the absorption, the established public services involved in some phases of rehabilitation, and there are a good many, nor the loss of identity of private agencies, many of which have pioneered and all of which are dedicated in their attempts to aid the disabled toward rehabilita-

tion and independent living?

From the local viewpoint, it would seem that instead of establishing separate evaluation centers for groups with various types for those affected by the various types of disabilities, we must concentrate on the establishment and the adequate professional staffing of comprehensive evaluation and treatment centers in a few localities, usually where there is a medical school.

The purpose of an evaluation is to enable the health, the rehabilitation, the social work, and educational personnel to begin and to carry through activities, sometimes mutual activities, which will help

the person evaluated to solve his problem.

You cannot just have an evaluation center and drop it there. From such evaluation centers there would have to be teams made up of personnel from indicated disciplines to carry out the agreed upon plans of the physical, social, and other rehabilitative services.

The persons given evaluation, treatment, and recommended followup at these centers will live in communities, as you have said, isolated from the center, with very limited numbers of trained per-

sonnel available locally.

State rehabilitation services will probably need to have mobile teams to follow through in these home communities, and to help or-

ganize local teams.

In local communities where there are not always the professionally trained personnel, there are persons who can be trained to assist there as volunteers.

I think of the Red Cross nursing courses for the home care of the sick, and other people who would be able to give considerable service in carrying out the recommendations of the evaluation center.

It may be that regional education boards and the respective States, would consider the establishment of training courses, specially for personnel dealing with the chronically disabled on a coordinated

basis, that is, in teams.

This training would also be for the generalists who may not need the technical skills, such as a therapist, a nurse, a teacher of the blind, or the deaf, would need, but who would have a comprehensive knowledge of causes and preventions of disabilities or their social and economic consequences, and how to effect teamwork, how to use personnel to the best advantage, and to recruit and use local volunteers.

The healthy trend that we note in Federal legislation in providing funds for research, health facilities, and so forth, for nonprofit agencies as well as public agencies, could be still more beneficial providing for the inclusion of private with public funds to carry out needed local services, especially in the area of local programs designed for independent living for the chronically disabled.

Mr. Elliott. Thank you very much, Miss Morgan, for your very

helpful testimony. We appreciate it very much.

Our next witness is Judge Talbot Ellis, of the juvenile court in

Birmingham.

Judge, I know you have been before my subcommittee before, and you always bring such fine ideas that Mr. Daniels and I will be very happy to hear you for 10 minutes on our problems.

STATEMENT OF HON. TALBOT ELLIS, JUDGE, JUVENILE COURT, BIRMINGHAM, ALA.

Mr. Ellis. Mr. Elliott, Congressman Daniels, I am like Anthony, I believe. I really didn't come here to speak. There has been so

much said already that I really meant to listen.

Then I was running away from something back at my court that would make a man jump out of a window, almost, so it is a relaxation to come up to Judge Kenneth Griffith's court in Cullman and meet with your fine committee.

You asked me to come as a witness some time ago. When I read exactly what you were considering on this House joint resolution, this bill, I did not believe it was in my backyard, and I do not think

that it is now, except very indirectly.

Mr. Elliott. Judge, I really wanted to hear you testify in order

that I might ask you two questions.

The first is this: I want to know if you have made any study in Jefferson County or in Alabama, or elsewhere, for that matter, of the relationship between juvenile delinquency and the handicaps, physical and mental, to which our people are heir.

Mr. Ellis. I could not give you any figures on it. I can see these kids go before me from day to day, and I can point out to you a number of famous cases that I have had, that other judges have had,

that seem to grow out of physical handicaps.

The most interesting and the most famous one that I know of was a case Judge Schramm, judge of the juvenile court in Pittsburgh, Pa., who just died last December, had concerning a little boy named "Old Baldy." At about 6 years old, when his mother was at a PTA meeting, or something, their little boy pulled a pot of hot wash off of a stove and it landed on his head, and from there on he did not have a hair or a root left alive. Because of that physical disability, that boy did everything in the book there was to do and violated every law there was for a little boy to violate except murder.

If that kid was not physically handicapped, I will eat your hat, and yet, under the existing law regarding handicapped children and this aid to handicapped that you have been discussing here today,

that kid would not be eligible for any help.

The funny thing is that the most expensive wig that money can buy—and you need not laugh, because this is a flesh-and-blood story—

the most expensive wig that Judge Schramm could buy and put on that kid's head cured him of his delinquency and he is a law-abiding man today. That kid was as proud of that wig as you are of your new Cadillac, if you have one.

Physically handicapped? Yes. It did something to that kid to be different from the rest of the kids, to such an extent that he would kick your teeth out if you got down low enough or he got up high

enough and he didn't like what you said.

There is a child who has just gone through the court in Birmingham who was born with a defect. He had no enamel on his teeth and teeth turned sideways. Some dental work has made a difference between a law-abiding citizen and a thug out of that little colored boy.

So there certainly is a great correlation between physical difficulties

that a child has and delinquency.

What the percentage is-I will not give you figures. I know you

can take figures and prove anything with them.

As I said to the committee before, figures don't lie, but some liars

can really figure.

If I say one other thing, Mr. Chairman, before I go on, I would like to back up what a worker of mine yesterday said before this committee, Miss Ethel Gorman—maybe you remember that prematurely gray young woman, who worked for me for 5 or 6 years in the court and just left me to go with the department of social hygiene—I got what she said and the last of what she said was two fields in which she said this committee could be of some help in this kind of work. I do not know that I should quote them; her statements are in. The last two paragraphs are the important part to me.

It seems to be pretty general, gentlemen, that the help that may be needed from the Federal Government might be considered as training help, or the training of personnel. I believe in States rights. I think, like Judge Griffith over there does, that, if the Federal Government could release certain sources of income, we States ought to do these things for ourselves, but the Federal Government is taking nearly all the money and does not leave any money locally for the local folks to do what ought to be done and what should be done.

If you are going to keep the money and keep on taking it, then I think you not only should, but that you have a responsibility to,

do some of these things in the local community.

I was at a recent meeting in Birmingham, and I thought when I came up here today we might be talking about Congressman Green's House bill, 7072, or your House bill, 3464. By the way, whatever

happened to them?

Mr. Ellott. My bill was reported out by our subcommittee last August or thereabouts, and about that time I became ill and Congress adjourned around the 1st of September. It is now pending before our full committee. I am hoping at the next meeting of our full committee to call up that bill and to get it reported out.

Mr. Ellis. And Congressman Green's 7072?

Mr. Elliott. Well, as between the two bills, there is, I suspect, some considerable debate and discussion, perhaps, whenever the bills come before the full committee, but they will be before the full committee shortly.

Mr. Ellis. Let me say two things further, Congressman, and if there are any questions I will be glad to answer them. I planted a seed at a meeting in Birmingham about 10 days ago, a seed that was planted by the very comprehensive study that was made under the direction of the coordinating council in Birmingham in 1954, and that was the need in our metropolitan area of a new, modern, and up-to-date juvenile detention facility within our multimillion-dollar medical center, which you are personally acquainted with.

That was recommended by the 1954 report of all the social agencies in our community. That has been recommended by me and a number

of other people.

I realize it is something that will not just happen overnight. But, I repeat, if you cannot figure any way to release to the States some of the money you are getting on a national level, I sure would like to see in my old age the Federal Government build such a center in our medical center, where adequate doctors and the University of Alabama students could study "Old Baldy" and some of these cases that we deal with daily and find out how come Johnnie can't read or how come Johnnie does like he does.

Second, Congressman, I would like to report to you that the two bills that I just named by number have been endorsed by the National Council of Juvenile Court Judges, of which I am a member, and I was

on the committee.

In Salt Lake City last summer, they approved, by resolution, Federal legislation for the establishment of a program for the training of qualified personnel in the delinquency field, and in the initiation of pilot projects and research programs on delinquency, and urged that the Congress enact appropriate legislation for this purpose.

The chairman of that committee was Judge Joseph Felton, from

Salem, Oreg., the home State of your Congresswoman Green.

Without having anything to say, I have said too much. So, thank you very much for this opportunity.

Mr. Elliott. Thank you, Judge Ellis. You always stimulate my

thinking. I appreciate your kindness.

Mr. Ellis. Thank you.

Mr. Elliott. Our next witness is Mr. Charles F. Zukoski, president of the Jefferson County Coordinating Council of Social Forces, Birmingham, Ala.

Let me say to you, Mr. Zukoski, that we are very happy to have you.

I am looking forward to what you may have to tell us.

STATEMENT OF CHARLES F. ZUKOSKI, JR., PRESIDENT, JEFFERSON COUNTY COORDINATING COUNCIL OF SOCIAL FORCES, BIRMING-HAM, ALA.

Mr. Zukoski. Thank you, Mr. Elliott and Mr. Daniels. I am going to speak as a layman here, because I am a layman and have not the technical competence to speak of the many fields which have been brought to your attention today and yesterday.

I feel I have learned a good deal more than I am going to be able to contribute, and yet I think there are some things, from the point of view of the ordinary citizen, that can be said and may be of some value to the committee. I will try to say some of those things. I am to devote myself largely to the matter of the structure providing this aid in which this bill is interested. I think that you have learned in the hearings you had, and out of your other experience, that there is a tremendous number of different aspects of this problem of the disabled. There are many diverse conditions which prevail throughout the country; there are many different ways in which these problems can be met.

I think it is one of the strengths of America that we have 50 States, all of which, publicly and privately, are experimenting in different ways in trying to meet these tremendous needs of the dis-

abled and the handicapped.

I think that, to the extent that we can, we have to leave that as a matter for State and local solution. It has always seemed to me that Federal aid has two main purposes. One is to provide some money which, as Judge Ellis said, we do not always have available in the States and localities and which the Federal Government has in various ways collected and can provide, and the other is one of

establishing standards.

I am not one who believes in States rights to the extent of ignoring the fact that the Federal Government, in providing or in establishing standards, has helped the States enormously throughout the country. I see all kinds of evidence of that in Alabama. I think that, in this matter of rehabilitating and educating the handicapped, there is certainly a lot of room for that, through the development of the Federal Government that is interested in that subject.

Nevertheless, I do believe that to a very great extent we have to do that locally and within the States. For that reason, I am inter-

ested in the structure of this bill. There are several titles.

Titles II and IV, as I understand them, appropriate money, or through other appropriations will make available money, to some designated agency of the States.

Title III, which deals with workshops and particular projects, apparently will provide that the Secretary will make the funds available to various approved projects.

Am I right in that assumption?

Mr. Elliott. Yes.

Mr. Zukoski. I think that the manner in which titles II and IV handle the matter is excellent, because I don't see how, given the need for dealing with this on a State and local basis, it would be possible for the Secretary to designate all of the ways in which the funds can be used.

With respect to title III and the workshops, I anticipate a tremendous demand on the Secretary's time, the time of his staff, and the time of the Department, in trying to analyze and reach some conclusions

as to priorities for a multitude of different projects.

For that reason I would like to suggest for the consideration of the committee the desirability of some alteration in that title III, and the method of disposition, perhaps again making funds available to each State on the basis of some agency in the State studying the local requirements, the relative needs of these different agencies, public and private, who have appeared before you and who have tremendous claims on whatever money is available, and arriving at some element of priority. I would also like to suggest, as Miss Morgan and others perhaps have suggested to you, the desirability of establishing some machinery for a citizens' advisory council or councils, perhaps one on a statewide basis within each State, that would be composed of people who have interests in these different specializations we have been talking about, and who would give to the State the benefit of knowledge from which a well-balanced program, taking into account the facilities we already have—and we have many of them in Alabama, as well as in other States—a well-balanced program of filling in and of developing and making progress in this overall field in which we are all interested.

I know the value of that kind of a council or committee, because we have had so many evidences of it in the work of our own organization. For example, take the case of our workshop for certain of the handicapped in Birmingham. This started as a workshop merely

for the orthopedic cases.

Some years ago we got Mr. Wise and others of the State rehabilitation, vocational, and rehabilitation service, together with groups representing the blind, and with groups representing others of the handicapped, and that facility was expanded to include the blind and,

later, to include the mentally retarded.

We have worked in the fields of providing facilities for the return of patients in the State mental hospitals on ordinary living, and we have worked there with both public and private agencies in the creation of a foster-home program, which is now functioning in Birmingham, and which is working on the return of those persons to productive and ordinary living, working with the State rehabilitation service.

We are working with the schools; we are working with the health

department and other facilities.

In the field of aid to the hard of hearing and those with speech defects, we brought into play the public schools, and have established facilities in the public schools, special facilities for dealing with those exceptional children.

What I am saying is: As I can understand it, this is a problem of coordination and of selection of priorities and of recognizing and analyzing, first, all of the needs, and then determining what can best

be done.

The Federal Government can give a tremendous impetus to this whole program through this bill, by providing some funds and in providing through the Secretary certain standards that should be

mat

But I believe it would be very desirable to establish within the bill a system whereby funds would be made available to one or, possibly, two social agencies in each State, and that, with that, you have some machinery for a representative council of State citizens such as have, on a national scale, in one phase of the bill, a provision for a national advisory council.

I think you could have this on a local basis within each State, and

that your money would be tremendously more effective that way.

Mr. Elliott. Thank you very much, Mr. Zukoski.

Have you any questions, Mr. Daniels?

Mr. Daniels. No. I wish to compliment Mr. Zukoski for his very critical analysis of this bill. I think your testimony will be very helpful.

Mr. Elliott. He has done a good analysis of us for a long time, and we appreciate it.

Mr. Zukoski. Thank you.

Mr. Elliott. Our next witness is Dr. Warren Weil, of Birmingham,

Dr. Weil. Thank you.

Mr. Elliott. Let me say that we are happy to have you, Dr. Weil.

STATEMENT OF DR. WARREN B. WEIL, PHYSICIAN, BIRMINGHAM, ALA.

Dr. Well. Thank you, Mr. Chairman.

I reflect Judge Ellis' point of view that he came to listen, because I did, too. My main reason in coming was to lend any encouragement I could to the passage of the legislation proposed for reasons which are less specific than many you have heard; there is just so much to be done that any help we get is going to be useful, and the sooner some comes, even if it is a little awkward in spots, the better off large numbers of people are going to be.

Any notes I have I made in the last few minutes, and they are poorly organized, possibly. I have no idea of what has been said before, but after listening to a few of these witnesses, I am sure that you have a fairly comprehensive picture of what is being done and what needs to be done with regard to the opinions of the various individuals who head up the agencies and societies, organizations that have an interest

in this problem.

As a physician, and speaking for myself only, I have read the bills over and I must confess I stayed a few minutes trying to figure out just how much money would be coming, and I decided I did not know about that and let it go by, because it looked like it would be all right.

I thought of the bills and how that would help me as a physician. I would like to point out briefly some of the problems a physician has in dealing with the individuals that we think of as in need of

rehabilitation.

You mentioned the problem of distance; that is a particular problem for people who have deficiencies of any kind that affect their health. No matter how we try to arrange it or no matter how encouraging we are, no matter what our plans are, the fact that it is several miles, not 100, but 20, sometimes, and there is no busline or no railroad, and the individuals have to depend on someone to bring them to where they can be seen and helped, is a tremendous problem.

It has its impact not only because it exists, but because it adds to the burden of the handicapped in that it adds time between the time that

they start and the time that they accomplish something.

For those of us that have never experienced the limitations in the serious illness lasting a long period of time, the very fact that the goal is so distant it is going to be difficult.

It is easy to say, but hard to do to convince somebody that not within a month or 6 weeks, but in 4 years they will be able to resume some sort of activity that will make them independent unfortunately depresses most of them to start.

The ease with which some of the initial goals can be accomplished

is a terrible thing which has to have consideration.

Another aspect of the people who are in need of what we call rehabilitation is the fact that there is a tremendous emphasis on the individual involved.

It isn't because the people who are interested in this field are not aware of the other problem, but they feel fortunate that they can help

this one person.

But a consideration of the family unit is terribly important. I have seen many, many situations in which we have outlined such simple things as diet, or the needs for physiotherapy which can be performed in the homes on occasion, the need to study and learn simple things.

Just the problem of illiteracy is a tremendous handicap. I have had situations—I had a man with a stroke, as an example, and we were severely limited by the fact that there were whole family units in which there were no literate individuals. That makes for an ex-

tremely difficult situation in terms of rehabilitation.

That would not be so bad if it was unusual, but it is not unusual. That is the tragedy.

So considerations of the family units are important.

I am not going to elaborate on anything further, but another area that would take a lot more time to talk about is the patient that has any one of a number of known psychotic, but nevertheless important, mental illnesses.

Mr. Elliott. Such as what?

Dr. Weil. The constitutional psychopath, the individual who, for want of a better term, considers things inadequate. They cannot utilize opportunities, for reasons that are not always clear, but very often are a distillation of both some physical disability, cultural lack of opportunities, cultural or economic depressions, and it adds up to an individual that comes to maturity in terms of their years without any of that get up and go that many of us have.

The older a person gets without starting, the harder they are to

start.

There is no question about it.

Mr. Ellis. What do you call the general field of inadequacy?

Dr. Weil. Well, in more sophisticated society, we sometimes refer to them as neurotics. In less sophisticated society, we generally designate them as bums.

But neither of those is a fair statement because they are generalizations. It has to be a much more finite definition of the factors in-

volved in creating this before you can do much about it.

I have had the experience, and I am afraid I am running over my time, of seeing people who are applying for disability benefits for one reason or another, who put the emphasis on their back, for instance.

I have two men in the hospital now. One of them is 49 and the other is 50. They both have the feeling that they are disabled, they

have had a backache for many years.

Both of these men have been seen not only by myself, but by orthopedists, neurologists, and neurosurgeons. They have had the advantage, if it be that, of competent X-ray examinations, physical examinations. There is no organic illness to be found.

But nobody considers that they are mental cases.

However, both of these men are illiterate. I asked one man how far he had gone in school and he said, "The third grade, or at least I was in the third grade 1 day."

He can neither read nor write.

In the recent boom years, during the war, he was employed in an industry which has thousands of employees. He was given a weekly salary check, and he made what might be considered a pretty good living because there was not a keen appreciation of his deficits. This man will have great difficulty in establishing his disability on physical grounds, and unless there is enough understanding of people like this, and this man has enough of his grasp of his society and the community, to feel that it is necessary to justify his inadequacy on physical grounds, it takes a tremendous amount of effort to persuade a man, particularly like this, who is about 44 or 45, well, it would be, the one I am speaking about now I mentioned is 49, that there is any purpose or aim in him being anything other than physically disabled.

But these are problems that have to be faced.

I think the one phrase that I noted in the bill that I wondered about, and in fact I called up the office of vocational rehabilitation of the State to find out, was the definition of the term "employable age."

I think that any bill dealing with the physically handicapped and those that need rehabilitation for any reason should not be limited by a certain year. Presumably there is a year of 16, 18, 20, or something.

One of our big needs is to close the gap. The individual who is not going to get along because they haven't the intelligence, the physique, or the stamina, has to be recognized early, and services and treatment, evaluation and care, have to begin as soon as they can be begun, in order that this person would be delivered to a place where they will be useful, and where they can be less of a burden on everyone else as soon as possible.

This is an exaggeration, perhaps, but there is a tremendous en-

thusiasm for children. I think you know that.

I was stopped on the way up here by a bunch of eager, conscientious mothers, stopped by the State police, and it was a mothers' march for polic. But mothers do not march for their fathers-in-law.

There is a certain stagnation when you get past childhood. If there is a gap between the enthusiasm and the facilities for children and then nothing is available until the person is somewhat older, the inertia that is yours during that time can be deadly in terms of stimulating or making useful any motivation that the individual

might possibly have if they were taken in hand early.

Specific things that occur to me also, and then I have finished, are

these:

There should be, I think, some consideration in encouraging, and I do not know just how it would be done, the availability of some of the things that would make it easier for these people to face the future.

On a simple thing like health insurance, the individual who is disabled, whether they have mental disability, physical disability, very action is desired the property in the large property.

often is denied the opportunity to buy health insurance.

The fear of illness, the hazard of some illness that may have nothing to do with the person's disability, is anxiety, provoking and interferes with the proper adjustment; these people are fearful so far as their families are concerned.

They are fearful so far as taking advantage of opportunities is concerned, because they feel that if anything should happen to them they have nothing to fall back on except some public source, which is depressing.

There should be, I think, some recognition of the fact that we have an increasing number of chronically ill people. They are growing not only in terms of percentage, but as the population grows in terms

of numbers.

A tremendous amount of education is necessary so that people will accept, by and large, the fact that there are many conditions in which

control rather than cure is the aid.

I think I am probably coming back and saying another way that efforts in the field of rehabilitation have to encompass education of the public certainly, but more particularly those who are in close proximity to the individual.

Finally, comes the question of employment. There is a tremendous enthusiasm in an academic way about employing people who are disabled, either physically or mentally, but the figures are really a little

depressing.

People who are in good health, presumably, don't get employed too well after the age of 48, unless they have some special art or craft. I have forgotten the exact figures, but I remember once asking the director of the employment office in Birmingham how many people had been hired in 6 months who were over the age of 50, and it was a startlingly small number.

The ones that had been hired were people who had a special skill

and there was some demand for their services.

So the problem of employment is a terribly important one in a practical way, and I believe that any rehabilitation efforts should encompass the development of individuals who do little more than study the industries in the areas and find jobs so that the employers can be sold on the job being done rather than the man.

If the man is sent out and he has all the recommendations that he needs, that he can be an upholsterer or do any one of a number of

things, he may or may not find employment.

But if jobs can be identified and then men trained to do them, and then the employers sold on the feasibility, I think we would employ more. I think it would become a more realistic concept to the employer if they could be shown, that it was not his good will that we wanted, or it was not his desire to be an aid to this community effort, but that he could profit from the effort of this man in this job in the way that he profits from the efforts of his other employees.

I think we would do better.

I want to thank you for listening.

Mr. Elliorr. Thank you, Dr. Weil. You have stimulated my thinking very much, and I appreciate it.

We are glad to have you. What type of practice do you have,

Doctor?

Dr. Weil. I am an internist, and I came down here from 2 years

in an occupation medical clinic in Boston, Mass.

It is about the only one, though, there may be several others. There are many industrial health clinics, but Dr. Harriett Harding, who is the director of this one, called hers the occupational medical clinic for

the reason that we were just as interested in the housemaid's knee as someone with silicosis.

It gives you a broader approach.

Mr. Elliorr. I hope you find your stay here rewarding, and I hope you will feel free to give us the benefit of your thoughts.

Dr. Well. I have been here for 5 years, so I guess I am an oldtimer

now

Thank you.

Mr. Elliott. This completes our list of witnesses for today.

Let me again express to every person who has made these hearings possible my very deep feeling of pleasure. I expressly appreciate the citizenship of Cullman and Cullman County, to the public officials who have done so much to make this stay of our subcommittee pleasant and rewarding.

I publicly thank the members of my staff and of the staff of the subcommittee for making the arrangements which have enabled us to hear 60 witnesses in 2 days. Out of this I hope will grow some-

thing that we can all feel proud of.

I notice Mr. Jim D. Moody, chairman of the governing body of Cullman County, Ala., is in the courtroom. We appreciate his encouragement of these hearings.

The subcommittee will stand adjourned.

(The following statements and letters were submitted:)

STATEMENT OF HON. CHARLES E. BENNETT, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF FLORIDA

Mr. Chairman, I appreciate your giving me this opportunity to appear before your committee today in behalf of my bill, H.R. 7546. My bill would amend the Vocational Rehabilitation Act in order to provide assistance to the States for certain workshops, rehabilitation facilities, and rehabilitation evaluation services. It would authorize appropriations beginning at \$10 million the first year and rising to \$15 million during the third and subsequent years for the purpose of encouraging and assisting in the establishment of public and other nonprofit workshops and rehabilitation facilities needed in rehabilitating physically and mentally handicapped individuals. It would also authorize appropriations for rehabilitation evaluation services.

In introducing this bill, I have been cooperating with the Goodwill Industries of Florida. Recently, Mr. Robert C. Adair, executive director of this organization, wrote me an excellent letter regarding the need for enactment of this bill. I would like to quote from his letter, since it is the best statement I have seen

on the bill:

"Better than 1 out of every 10 persons in the United States have a serious physical, mental, or social handicap. These are very conservative figures, as I believe the last figures issued by the Department of Health, Education, and Welfare Office of Vocational Rehabilitation, had upped this to 14 percent of the total population. You can see what a drain we would have on our welfare funds if all these handicapped people were not given a chance to work and earn, and had to be supported by the Government.

"The waste in productive labor market would also be tremendous, but the greatest tragedy of all would be the blighted personalities and the unhappy

lives of this great section of our population.

"Happily, however, handicapped people do not sit down and allow someone else to solve their problems. For, approximately 9 out of every 10 handicapped people, either through family, friends or their own ingenuity, find the solution to their problem, but this still leaves from 1 percent to 1½ percent of our population that is handicapped and will be on relief the rest of their lives unless some rehabilitation organization helps them to make the best possible use of that portion of their body that is left, has them trained so they can perform a job, sees that they have such a job, and helps them to adjust socially and re-

ligiously to their community and surroundings so they can live the full, happy, abundant life that we all desire to live, * * *

"There is a tremendous shortage of well-managed and properly operated workshops. Grants for this type of service are greatly needed for the evaluation, adjustment, trade training, and terminal aspects of sheltered work.

"Thus you see, our goal of 1,000 handicapped people employed in Goodwill Industries by 1965, is not at all impossible if funds are available to us for the opening, the proper equipping and handling of these sheltered workshops.

"When you consider the potential of help that can be given to handicapped people in all 50 of the States, you can see the tremendous job that is ahead of

the sheltered workshop.

"These goals are going to be achieved. These handicapped people are going to be given evaluation, adjustment, training, and work. The question is, when? If we have to raise all of our own money, our program will be slow, but will be certain, and we will reach our goals, but it will be in some time in the quite distant future.

"With help in the form of grants to sheltered workshops, we can reach these goals in the foreseeable future and the handicapped people can live and work now rather than planning for the handicapped people of the next generation.

"Sheltered workshops are like handicapped people—they do not ask for charity—they ask for a chance, and sheltered workshops simply do not ask for outright Government grants, but ask for matching grants, so we will do everything with our own power to carry on our own job, and then in relationship to the way we do this job the Government can help in proportion through matching grants.

"The suggestion in your bill of two Government dollars for every dollar that we raise and put into the program is a fine encouragement and will help to spur each of us who are in the sheltered workshop field to do our very best.

"If the \$1,800,000 that our handicapped employees pay in income taxes and social security could be made available to us in the form of expansion grants, our program would go ahead by leaps and bounds. We, of course, do not expect this money to be turned back to us because handicapped people are proud of their ability to pay income tax and to be a part of the great social security program. But if a grant of similar sum could be available, we would increase the amount of these taxes coming into the Federal Government many-fold.

"We feel it is just good business to take handicapped people out of the relief line where they are tax users and put them in the payline where they become taxpayers. But greatest of all, we feel that it is our God-given commission to help every handicapped person possible to live the fullest, the happiest and

the most abundant life of which he is capable."

I will deeply appreciate your committee's careful and serious consideration of this bill. I hope it will be possible to report it favorably.

STATEMENT BY DR. A. P. JARRELL, STATE DIRECTOR OF VOCATIONAL REHABILITA-TION, STATE DEPARTMENT OF EDUCATION, ATLANTA, GA.

Mr. Chairman and members of the subcommittee, it is a high privilege to appear before this distinguished committee on behalf of disabled people who need help in achieving economic and social independence.

At the outset, I want to say that the vocational rehabilitation forces in Georgia endorse the provisions of the pending bill to expand the services now provided under the joint Federal-State program, namely, H.R. 3405. We also

endorse House Joint Resolution 494.

The Georgia Rehabilitation Association, representing nearly 1,000 professional workers and lay people, recently passed a resolution supporting the provisions of H.R. 3465. A letter reporting this action was sent to the chairman of your committee.

As to the need for such legislation, may I outline briefly the situation in my

State.

During the past 5 years, 26,117 disabled civilians have been restored to productive jobs through the services of the joint Federal-State program of vocational rehabilitation. There has been steady increase, year by year, in the number of rehabilitations for the past 10 years.

Throughout a 5-year period, we have provided services to nearly 12,000 disabled persons annually. At the end of the fiscal year 1958-59, there were

5,938 cases on the active rolls still receiving services and there were 8,450 applications for services awaiting investigations. Moreover, there are thousands of other seriously disabled people who need services which we are unable to provide because of the lack of funds, facilities, and trained personnel, and because of legal restrictions.

The Office of Vocational Rehabilitation estimates that there are in the Nation about 2 million disabled persons who need vocational rehabilitation services, and 250,000 annually are becoming disabled. On this basis, it is estimated that there are about 30,000 disabled people in need of vocational rehabilitation services.

ices in Georgia.

Under the "support program" Georgia received \$2,222,889 of Federal funds during fiscal 1959. The State spent \$1,450,016.87 for this program, which was \$219,164.87 more than the amount required to match Federal funds. This year, 1959-60, we have nearly \$300,000 of State funds in excess of the amount required to match the Federal funds.

As pointed out in my letter of June 22, 1959, to the chairman of this subcommittee, Georgia appropriates, on a per capita basis, more funds for vocational

rehabilitation services than any other State in the Nation.

There are several other States which are appropriating more funds than

OVR can match under the present formula.

Therefore, Mr. Chairman, we respectfully urge that the allotment base be increased at least in an amount sufficient to give these States enough Federal funds to match the State funds available. From my study of the formula for distribution of funds fo rthe "support program," an allotment base of approximately \$85 million would be required. This would enable these States to expand their programs in vital fields.

We are hopeful that Congress will see fit to amend section 3 of Public Law 565 so as to permit the transfer of extension and improvement grants from those States which are unable to use them to States which have sufficient funds to activate projects under this section. This proposed change in the law would be helpful to the States which are financing adequately their part of the

program.

Georgia is undertaking a tremendous expansion of its mental health program. It involves an expansion of facilities, staff, and services at the Milledgeville State Hospital; a new hospital for the mentally ill in Atlanta, together with five additional intensive treatment centers similar to the one now in operation at the Talmadge Memorial Hospital and Medical School at Augusta. The cost is estimated at \$15 million above what is now being spent for the treatment of the mentally ill.

The Georgia Rehabilitation Agency is cooperating with the State Department of Public Health and the State Department of Public Welfare, hospitals, and other agencies, in developing a coordinated rehabilitation program for mentally

ill, emotionally disturbed and mentally retarded persons.

Our counselors work with teams of specialists at several hospitals in planning rehabilitation services for mental patients and epileptics who ultimately may be returned to employment. As the mental health program expands, additional counselors will be needed for this specialized service.

For the fiscal year 1958-59, the agency rehabilitated only 137 mentally ill persons. Currently, we are providing rehabilitation services to about 400 in-

dividuals whose disability has been diagnosed as emotionally disturbed.

The mental health program has the backing of the Governor, the legislature, and citizens, generally. It will offer a great opportunity—and challenge—to the rehabilitation agency to provide rehabilitation services to patients from these hospitals and centers. But more money will be required. If more funds were available, I am confident we could increase the number of rehabilitations among persons with mental handicaps threefold in the next 2 years.

I am of the opinion H.R. 3465 represents a logical and constructive step in the development of the Nation's rehabilitation services. Year after year, we are compelled to decline services to thousands of applicants who do not have the rehabilitation potential to qualify under the present law. Many of these people, we are certain, could be restored to some degree of self-sufficiency as envisioned under H.R. 3465—the "independent living" rehabilitation measure.

As evidence of Georgia's interest in "independent living rehabilitation," the general assembly, at its 1959 session, amended the State rehabilitation laws to authorize this type of service. We are planning to put this measure in effect

when appropriate Federal legislation is passed and Federal funds become available.

In Georgia, there is a pressing need for more workshops and vocationally oriented rehabilitation facilities to serve more of the mentally ill, epileptics, mentally retarded, blind, deaf, cerebral palsied, and other seriously disabled individuals. There is a great need especially for work evaluation and diagnostic units within both rehabilitation facilities and sheltered workshops. With such facilities, we could rehabilitate many borderline cases which now are neither ready for vocational schools nor competitive employment. This situation is another reason for our strong endorsement of H.R. 3465.

In Georgia, the school for the deaf is a unit of the vocational rehabilitation division. We know from long experience that it is difficult—if not impossible—to get specially trained teachers of the deaf to staff this school. During the past 10 years enrollment there has increased from 291 to 427, which shows the

increasing need of well-qualified teachers.

Of scarcely less importance is the pressing, urgent need for psychologists, social workers, counselors, and speech therapists. The ability of these professional workers to serve the deaf is seriously limited because of lack of special

training necessary for evaluating and meeting their needs.

We know, too, that there is a shortage of trained audiologists and speech pathologists in the private agencies from which we purchase services for our clients. Frequently our clients with hearing and speech impediments are compelled to wait for weeks before appointments at these centers can be met.

Enactment of House Joint Resolution 494 would in time help materially in

remedying this shortage of trained personnel in these fields.

We shall be glad to have any members of this subcommittee—or your colleagues in Congress—visit Georgia and observe the operation of our vocational rehabilitation program.

I thank you, gentlemen, for the opportunity to appear here today. If there are

any questions, I shall be glad to undertake to answer them.

THE BIRMINGHAM INSTITUTE OF PHYSICAL MEDICINE AND REHABILITATION, Birmingham, Ala., February 1, 1960.

Hon. Carl Elliott, Representative, Seventh District of Alabama, House Office Building, Washington, D.C.

DEAR SIR: As a specialist in physical medicine and rehabilitation I greatly enjoyed reading about your committee's procedure held in Cullman. The meeting was very timely and will be a great benefit to the citizens of our State. It seems to me that Alabama has just as good facilities and personnel as any other State but, probably, we are not utilizing the existing specialty and its

ancillary forces.

Chronic illnesses, geriatrics, psychiatric cases, and the chronic alcoholics need more than rehabilitation per se. A chronic alcoholic may recover from its habit but quite often he has peripheral nerve involvement and incoordination of the muscles therefore before a job placement could be assigned to him he needs treatments and evaluation. Homes for the aged where our senior citizens are sheltered and boarded are in dire need of physical therapy and occupational therapy. These citizens could help out industry within their physical capacity and thereby could maintain their American way of life, economic independence. May I offer the following suggestion to your committee:

(1) Utilizing all existing facilities whereby a team of physicians including a physiatrist, orthopedics, pediatrician, psychiatrist, internist, and surgeon could evaluate the best program for the future objective of the

patient.

(2) Construction of a rehabilitation center at our new medical center where patient could receive dynamic physical medicine treatments as ad-

vocated by Dr. Howard Rusk of New York.

(3) Physical therapists, occupational therapists, and corrective therapists should be utilized to the fullest extent under the direction of a physiatrist since physical medicine and rehabilitation embrace those ancillary specialties. (4) Establishing a school of physical therapy and occupational therapy where the young men and women of Alabama could receive training and thereby help our citizens.

Dear Mr. Elliott, call on me whenever it is convenient for you and may I offer my services to you and to your committee for utilizing all the services in the rehabilitation of the citizens of our great State of Alabama.

Sincerely yours,

F. F. Schwartz, M.D.,
Associate Professor of Physical Medicine and Rehabilitation.

COMMENTS OF CHARLES P. SCHUCH, DIRECTOR, THE WAKE COUNTY CEREBRAL PALSY CENTER, RALEIGH, N.C.

1. INDEPENDENT LIVING BILL

May I especially urge you to pass a form of legislation which empowers the local unit of the department of vocational rehabilitation to authorize expenditures to provide necessary medical evaluations, speech therapy, physical therapy, occupational theraby and other forms of rehabilitation training which will enable a handicapped person to become physically independent even to enable him to become economically so. I personally have seen many cases such as the housewife that could manage her home independently as a result of such training but was unable to get vocational rehabilitation assistance because there was no likelihood of her getting a job. This situation is true of many stroke victims who could relieve another member of the household if given the proper training. I sincerely and firmly believe that the value of the Office of Vocational Rehabilitation in our society would be greatly increased if given the opportunity to permit independent living.

2. SPEECH PATHOLOGY

Although there is a great need for an increased number of speech pathologists in the southern region, I personally feel there is even a greater need for qualified speech therapists (with somewhat less training than a speech pathologist). There are major medical centers throughout the South which do have the services of a speech pathologist available for consultant activities to aid local rehabilitation centers which attempt to provide speech therapy. However, there are a great many local facilities such as our own which are handicapped by the very acute shortage of adequately trained speech therapists. I feel that one reason for this acute shortage in the South is because there are so few accredited speech therapy training schools in our area. As a result, many native southerners immigrate to the North and West for this training and upon graduation are lured into employment by a local facility in that area. I personally feel that it would be money well spent if the Department of Health, Education, and Welfare could provide money to help establish adequate programs to train speech therapists in southern colleges and universities.

3. CRITICAL SHORTAGE OF OTHER ANCILLARY MEDICAL PERSONNEL

In addition to the critical shortage of speech therapists in the South, there is also a very acute shortage of physical therapists and occupational therapists. I speak from personal experience when I say that in North Carolina along there are presently enough vacancies to increase the number of physical therapists in the State by at least 25 percent. It has been only in the past 3 years that new schools have been established to train physical therapists, at the University of North Carolina and the University of Florida. I feel sure that in the near future the graduates from those new schools will help to relieve the shortage of physical therapists, but even the most optimistic person would not expect these schools to completely relieve the shortage. In line with the things included above concerning new facilities for training speech therapists, I feel that it would be money well spent to help establish one or two more schools of physical therapy in the southern region. The situation in occupational therapy is very much the same. The demand for personnel has been continually increasing in the past 10 years at a rate greater than the schools are able to train them.

UNIVERSITY OF SOUTH CAROLINA, Columbia, January 22, 1960.

Hon. Carl Elliott, Chairman, Subcommittee on Special Education, Committee on Education and Labor.

House of Representatives, Washington, D.C.

Dear Representative Elliott: I appreciate your kind invitation to appear before your committee during the public hearings in Cullman, Ala., January 27 and 28. Unfortunately, I shall be unable to attend these important discussions.

In my opinion, the basic problems faced in South Carolina with regard to the

field of special education are:

1. The fact that persons with adequate preparation and experience to serve on faculties of colleges and universities offering teacher preparation in special education simply do not exist in this State. In fact, they are so few throughout the United States that institutions are not able to train teachers as they must be trained. In some way, we must increase the number of competent teachers of special education.

2. State requirements for licenses or certificates to teach handicapped children are vague and, at times, not enforced because the supply of teachers is so limited. I believe this situation will improve when the supply of college in-

structors is increased.

Sincerely yours,

WILLIAM W. SAVAGE, Dean, School of Education.

STATEMENT BY C. ROBERT GRAVES

Mr. Elliott and members of the committee, I am Bob Graves of Lakeland, Fla., currently associated with Radio & Television Transcript Service of New York as their central Florida field representative. I am president of the Polk Federation of the Blind, a member of the board of directors of the Florida Federation of the Blind, and editor of the Florida White Cane. I come to you as the representative of the organized blind of the State of Florida and as such am the only authorized representative of any of the blind of that State who has been chosen by the blind themselves.

Insofar as it is possible I shall attempt to avoid giving testimony that has already been presented to you orally. In general the Florida Federation of the Blind fully approves and wholeheartedly supports the recommendations made by the Atlanta workshop. We are, of course, very much interested in supporting and urging a number of proposals that were not considered by the Atlanta workshop. I shall, however, attempt to restrict my testimony to mat-

ters that were covered in Atlanta.

During the hearing, Congressman Green asked a number of questions that lead to the line of discussion. Are special services and agencies for the blind really necessary We believe that the answer in both instances is "Yes." I feel that this was also the conclusion of the Atlanta workshop. The workshop recommended a number of special services for the blind that were not recommended for any other category. It specifically recommended that the Federal Government encourage States providing services for the blind to establish special agencies to administer these programs and that where these services were being provided by a general agency that they be administered by a special division within that agency.

To be sure blindness is a handicap in many ways and is therefore a disability. We believe, however, that the severity of this disability is far greater than its actual physical limitations because of the many misconceptions held concerning it. Entering the world of the blind those who lose their sight bring their misconceptions with them. Those who serve the blind must therefore counteract not only misconceptions held by the general public but the same misconceptions as held by the blind themselves. Unfortunately these workers unless they are specially trained or experienced are also subject to these misconceptions. It is practically impossible to avoid this situation where workers or administrators must concern themselves with more than one program of services.

Laws enacted and departmental rules and regulations already written have recognized in many ways that the physical limitations of and the misconceptions concerning blindness give rise to special needs and services and special approaches for the blind client. Here in Florida we have a special agency that administers rehabilitation services for the blind and handles their needs in some other areas but the program of blind assistance is administered by the welfare department without any separation of the blind from other categories. When the Federation went before the committees of the State legislature to discuss this program we found that all of the thinking and planning of the welfare department was based on the old-age assistance program. The objection to establishing a special division for the blind is that the blind are only a small minority and that their numbers do not justify such special considerations.

We believe that it has been established that the blind have some special needs and that these needs will not be met unless they are given special consideration and we further believe that any group no matter how small are entitled to all of the services to meet their needs. It is further argued by some that if we are to give such special consideration to one handicap that the other handicapped can equally argue with Justice that they too should be given the same special consideration. We do not believe that it has been established that these other groups of handicapped persons have such specialized needs as do the blind.

It has been argued in some quarters that agencies for the blind should also serve the group known as the partially sighted. For services of this nature blindness has generally been defined as a visual acuity of 20/200, etc. Therefore among the blind there are those who have no vision and those who have some vision but an actuity of less than 20/200. There is a far larger group that have some visual defect but whose acuity is greater than 20/200 and less than 20/70. This group is now eligible for service by the general rehabilitation program because they do have some handicap in some areas. Because of the comparative size of this group and because of the facility with which its problems are solved we believe that their inclusion in services for the blind would result in a very material loss of services to the blind. The general rehabilitation program already has the authority to serve this group and we do not believe that they require a specialized personnel for administration and therefore we oppose any change in their status.

We fully support the provisions of H.R. 3465, the independent living bill. We think that the services it proposes are badly needed and that the bill should be enacted. We would like to see the bill amended in respect to the blind, removing its services from the field of rehabilitation and placing them in the field of medical and social services. We believe that a rehabilitation to any extent feasible should be accomplished when and wherever possible but we do not believe that agencies should be permitted to deceive us by reporting that a client is fully rehabilitated when this has only been partially accomplished. We deceive no one but ourselves if we rehabilitate persons by securing for them partial self-support and force them to remain on public assistance to secure the remainder of their support. They have neither been rehabilitated or removed from the welfare rolls. If this bill cannot be amended in this fashion then Public Law 565 should be amended so as to require rehabilitation agencies to report their closures in such a detailed manner as to make it obvious as to which cases have been rehabilitated with total self-support and which with only partial self-support.

The Atlanta workshop, because of the time limitation, did not discuss the subject of disability insurance but from private conversations I feel sure that there would have been a consensus of opinion in support of our recommendations if that part of the agenda had been reached. We recommend the elimination of the minimum age of 50 where the disability is blindness. We feel that where an individual suffers from this disability that his loss is just as severe at the age of 20 as it is at the age of 50. We recommend the elimination of the requirement that the disability of blindness occur after the applicant has met the requirement of employment in a covered industry. We feel that the disability of blindness is just as severe whether the applicant became blind before or after he was employed in a covered industry. We recommend the reduction of the requirement of employment in a covered industry from 20 quarters to 1 quarter for blind applicants. A large segment of the blind population is past the age of productive employment at the onset of their disability and would qualify for benefits under other provisions and only a small percentage of those in the employable age group are employed in covered industry. We feel that it should be made as easy as possible for these persons to qualify for benefits so as to prevent the necessity of their placement upon the welfare rolls. We feel that referral to rehabilitation should be recommended but not mandatory. There are instances in which rehabilitation is feasible but because of personal and family relations is not desirable.

We would like to see the reduction or elimination of the severity of State residence requirements, participation by the Federal Government in the home teaching program, a larger and more adequate library program for the blind and other improvements in services available to the blind. This committee has already held extensive hearings in regard to the violation of the civil rights of the blind but we would again like to remind you of our support for this

It is our sincere hope that these thoughts have been of help to you in formulating legislation and that you will feel free to call upon us if we may be of further assistance to you. We thank you for the opportunity to express these

(Thereupon, at 5 p.m., the subcommittee was recessed, to reconvene subject to call of the Chair.)

SPECIAL EDUCATION AND REHABILITATION

THURSDAY, FEBRUARY 18, 1960

U.S. House of Representatives, SUBCOMMITTEE ON SPECIAL EDUCATION OF THE COMMITTEE ON EDUCATION AND LABOR, Jersey City, N.J.

The subcommittee met at 10 a.m., pursuant to notice, in Freeholders Assembly Chamber, Hudson County Administration Building, Hon. Carl Elliott (chairman of the subcommittee) presiding.

Present: Representatives Elliott (chairman of the subcommittee),

Daniels, Giaimo, and Quie.

Also present: Dr. Harry V. Barnard, clerk of the subcommittee.

Mr. Elliott. Ladies and gentlemen, I welcome you to the hearings of our Subcommittee on Special Education of the Committee on Edu-

cation and Labor of the U.S. House of Representatives.

This subcommittee is meeting here in Jersey City to receive testimony from the public on the most unmet needs of the Eastern Atlantic States in the fields of special education and rehabilitation. are seeking, I might say, specific suggestions as to how the Federal Government may best aid the States and local communities in finding a solution of some of the problems in these fields.

These hearings are part of a comprehensive study our subcommittee is making of the areas of special education and rehabilitation.

We are reviewing legislation, analyzing Federal and State services in all the areas involved, and trying to determine what services are now available and what services are actually needed.

The hearings grew out of a real need on the part of your U.S. Congress, to reassess this whole area of special education and rehabilitation.

Early in the 1st session of the present 86th Congress a flood of bills dealing with special education, specifically with the physically handicapped, were introduced.

At the present time over 110 bills pertaining to this area are pend-

ing before our subcommittee.

Rather than legislating haphazardly or rushing into ineffective legislation, we decided to make an exhaustive study of the entire field to learn the unmet needs and how we could best cooperate with the States and local communities in solving them.

This is the fourth in our series of hearings. We have previously held similar hearings in New York City; New Haven, Conn., and

Cullman, Ala.

Further hearings are scheduled for Portland, Oreg., Los Angeles,

Calif., and Chicago, Ill.

Our stay here in Jersey City, I may say, has thus far been a most pleasant one. 869

Sheriff Flannagan has been more than hospitable to us. You know, I am well on my way to believing all of the wonderful things your fine Congressman, Judge Daniels, has been telling me about this city.

Let me tell you, though, that Texans have nothing over you people from Jersey City. Judge Daniels tells such marvelous stories about this fine city that even the Texans have been taking notes from him to

use in their own chamber of commerce brochures.

This assembly chamber is very beautiful. This is just one of the many things you have to be proud of and for letting us use this beautiful chamber, I would like to thank the Board of Freeholders of Hudson County.

At this time I recognize your Congressman, Judge Daniels, to present Mr. Gangemi, your county supervisor of Hudson County, N.J.

Mr. Daniels.

Mr. Daniels. Mr. Chairman, Congressman Giaimo, Congressman Quie, and ladies and gentlemen, I feel very, very happy that these hearings are being held in the 14th Congressional District of the State of New Jersey, the district which I have the privilege of representing.

I welcome the subcommittee here.

I would like to introduce at this time our county supervisor, the

congenial and affable Tom Gangemi.

In order that you may understand what a supervisor is, I would like to explain his function to my colleagues and to those people in the audience who come from areas where you do not have a supervisor. I would like to say that his position is more or less akin to that of county mayor.

Our county government is in the hands of a board of freeholders consisting of nine members who are in charge of all of our county institutions. I wish this committee will have the opportunity and I do trust the county supervisor will extend to the committee, if time will permit, an opportunity to visit the county institutions which are in charge of our board of freeholders and the county supervisor.

I am very, very proud of the institutions that we have here. We have not only a large county mental disease hospital, but also a geriatrics hospital, a hospital for our tuberculosis patients which recently embarked upon an entirely new area of operation—that of cardiac cancer surgery. Besides that, we have a maternity hospital and a number of other services which the community as a whole is sorely in need of.

I would like to call upon our county supervisor, Thomas Gangemi,

to present a message of welcome.

STATEMENT OF THOMAS GANGEMI, COUNTY SUPERVISOR, HUDSON COUNTY, N.J.

Mr. Gangemi. Thank you, Congressman Daniels.

Chairman Elliott, fellow Congressmen, ladies and gentlemen, as county supervisor I want to welcome this Committee on Education and Rehabilitation. I feel that this committee has done a wonderful job and are doing a good job because we in Hudson County realize that this program will more or less affect us not only in Hudson County, but throughout the State.

We realize that in our institutions we have a mental hospital where our patients are mentally disturbed or emotionally disturbed and because of the importance of this hearing and this bill that they are trying to set forth, we feel that not only us in Hudson County will be benefited by this great bill, but also throughout the country.

I want to welcome you here, Mr. Chairman, with the honorable Congressmen who are on this great committee, and I want to assure you that we in Hudson County not only welcome you, but invite you to visit our institutions and every other public office within the county and I can assure you that this stay here with your committee will be a pleasant one because we in Hudson County will make it pleasant for you.

I want to congratulate you and the rest of your committee for the

fine job that you are doing.

I wish you at this time good luck and God bless you all.

Mr. Elliott. Thank you very much.

The visiting members of our subcommittee are very happy to hear those fine words of welcome by Mr. Thomas Gangemi, county supervisor.

On my right, as those present know, is Mr. Dominick V. Daniels, Representative in Congress from this 14th Congressional District of

New Jersey.

Mr. Daniels has served all his time since he came to Congress as a member of this subcommittee and of the full Committee on Education and Labor.

On his right is Congressman Bob Giaimo, a Member of Congress from the State of Connecticut. His district is New Haven, and its

Mr. Giaimo, likewise, has served his entire stay in Congress on our committee.

The interest, I might say, of Mr. Daniels and Mr. Giaimo has been a source of considerable inspiration and encouragement to the committee.

On my left I have the pleasure of presenting Mr. Albert Quie. Congressman Quie is serving his first full term in the Congress of the United States, from the State of Minnesota, and he has likewise been assigned to the Committee on Education and Labor and has demonstrated his deep interest in the questions pertaining to education, special education, labor legislation, with which our committee deals day in and day out.

I have just received a telegram from Mrs. Florence P. Dwyer, a Member of Congress from the State of New Jersey. This telegram

is addressed to me. She says this:

Deeply regret commitments in Washington make it impossible to accept your

thoughtful invitation to participate in your important hearings.

I congratulate you and your subcommittee, including my distinguished New Jersey colleague, Congressman Daniels, for actively seeking, through public hearings in the field, the ideas of those who work for the betterment of our people. I plan to submit a detailed statement of my views on pending legislation.

Meanwhile, may I ask that you include this telegram in the public record as testimony of my strongest support for H.R. 3465 and House Joint Resolution 494. Growing incidence of chronic disability and increasing population of the aging make it imperative that noninstitutional means be found to restore disabled to independent living.

Also, as a member of board of trustees of Gallaudet College for Deaf, I know firsthand how urgent is the need for more well trained teachers of the deaf and for trained speech pathologists and audiologists.

In the midst of American plenty, we owe greater care and attention to the

needs of our handicapped and disabled people.

Florence P. Dwyer, Member of Congress.

Mr. Elliott. Our first formal witness today is the Honorable Raymond F. Male, the State commissioner of labor of the State of New Jersey, and chairman of the State rehabilitation commission of Trenton, N.J.

Mr. Male, we are very happy to have you and we look forward to

your testimony. You may proceed at this time.

Now, 30 witnesses, or thereabouts, have indicated their desire to testify today. That being true, it will be necessary that our individual testimony be restricted in time as much as possible. I hate to put a very minute time limitation on it, but maybe a little later today we will have to do that.

But let it be said that if the witnesses will summarize their statements orally and submit their written statements for the record, that the written statements will be made a part of our official record imme-

diately following the oral statement.

We have found in the past that by handling it in that manner we are able to save some time.

Now, with that as a background may I ask you, Mr. Male, to proceed.

We, likewise, have about 35 witnesses scheduled for tomorrow.

STATEMENT OF RAYMOND F. MALE, STATE COMMISSIONER OF LABOR, AND CHAIRMAN OF STATE REHABILITATION COMMIS-SION. TRENTON. N.J.

Mr. Male. Thank you very much, Mr. Chairman.

First, let me say that I will heed your sound advice with respect to the time in this hearing. I think I can stay well within the 10

minutes suggested.

Secondly, I would like to say on behalf of Robert B. Meyner of New Jersey, that he would like very much to have been here to testify personally in support of the work of your committee and, in particular, in support of H.R. 3465.

The Governor is not in the State today, but he did ask me to express to you his greetings and to hope that your stay here will be both a

pleasant one and a productive one.

The Governor did meet with our 14 Members of Congress from New Jersey and our 2 U.S. Senators within the last fortnight in Washington and on that occasion at a special breakfast which he holds annually with them in discussing legislation of particular interest to New Jersey endorsed H.R. 3465.

So it is clear on record in that connection.

New Jersey, I am sure you are well aware, has a long history in the field of rehabilitation. Not far from this very hearing room we have the world famous Kessler Institution of Rehabilitation.

Even more importantly the world famous Dr. Henry Kessler, himself, who has breathed into New Jersey and into those of us who carry official responsibility for some phase of this work, the kind of enthusiasm and fire and philosophy about this that I think you will find bubbling through many of the witnesses who will talk to you today and tomorrow, from officials, as well as from voluntary and private agencies in New Jersey who are concerned with this field.

In more recent years New Jersey, with, I must say, strong Federal participation, support and leadership, not only financially, but also staffwise from the Office of Vocational Rehabilitation and other agencies, has been helping us to increase the tempo of our effort in this field of rehabilitation and in the last few years actually our progress in this, our performance has doubled.

Mr. Elliott. Mr. Male, let me ask you right there, are the func-

tions of vocational rehabilitation in your office?

Mr. Male. They are. I wear two hats. One as commissioner of labor and industry; the second as chairman of the rehabilitation

commission.

I might point out that those who set up this commission back in 1918 had the wisdom to place in that commission also the responsible cabinet officers, dealing with the fields of education and of institutions and agencies which in New Jersey represent mental health, corrections and public welfare.

Mr. Elliott. What is your population of the State of New Jersey? Mr. Male. The population is now approaching 6 million and we

are told we will pass that figure in October of this year.

Mr. Elliott. How many people did you rehabilitate last year to

employment or reemployment?

Mr. Male. Through the rehabilitation commission somewhat more than 1,300 which I hasten to add was only 1 in 6 of the non-need in

New Jersey.

These, as you also know, were vocational rehabilitation. We are tremendously concerned in this State that because of the limitations of our law, as well as the Federal enactment there are many, many people for whom we cannot presently, with known knowledge, and known professional skill, anticipate productive employment at the end of rehabilitation.

That is why we are particularly interested in title II of your pro-

posal with respect to independent living rehabilitation.

Personally, I spent some 7 years working in the department of institutions and agencies in New Jersey where we were responsible both for public assistance programs, the State mental health programs, the commission for the blind, and also the licensing of nursing homes in New Jersey.

I would like, therefore, to say on this point that I have seen first-hand the victims of the kind of neglect that I think this bill would

go a long way toward meeting, toward fulfilling the need.

We have in our rehabilitation commission, as I mentioned, these many departments represented. I think one area not represented, but which should be, is our State health department, because our commissioner of health, Dr. Roscoe Campbell, who met with us yesterday on the subject of this bill, is very enthusiastic about the purpose and philosophy contained therein.

Also, on this commission are representatives of labor, of manage-

ment, of the public at large, and of interested citizen groups.

We are not so concerned about the left hand and the right hand of our bureaucracy.

I am aware that throughout the country there are people in some fields of public administration who are concerned about where the

responsibility should be placed for this important program.

Frankly speaking, as a commissioner of labor and industry, and as chairman of our rehabilitation commission, I could not care less where it is placed in our bureaucracy, but I could not care more about the fact that this should be done and I hope that your committee will bear that in mind.

I personally think that because of the philosophy and the feeling of the rehabilitation people in New Jersey and the tradition not only of citizen support, but the tradition of multiagency, public and private cooperation, that we can get off the ground rapidly if this

legislation were to pass.

I would like to point out, too, one area that may not be touched upon by other witnesses from New Jersey, another area of close concern of mine because of my position as commissioner of labor and industry, and that is our responsibility for administering the workman's compensation program in New Jersey.

I would like to point out to the committee, if I may, that this program, too, has a close relationship to the field of rehabilitation and

not just the field of vocational rehabilitation.

Our staff, our referees, our directors, find very often that the severely injured worker from industry may not have a vocational objective after all we can do under present methods, statute, knowledge, and so on

We think that this provision for rehabilitation for independent living is going to reach hundreds of people in this State in that

category.

We would like also to point out to you that New Jersey as the first of the 50 States has a demonstration grant of funds from the Department of Health, Education, and Welfare, through the Office of Vocational Rehabilitation and we have since July 1 of this past year been working to promote an office of coordinator between our workman's compensation program and our rehabilitation program.

This is already paying dividends. We are interested more frankly in the actual restoration of the disabled injured worker than we are in the mere financial recompense, however, important that may be

for the disability or the injury, itself.

We hope, in line with the philosophy that has been New Jersey's over the years, to find these people instantly and to get them in the hands of people interested in rehabilitation and not to wait for the long months and years that frankly sometimes it takes lawyers to figure out what their rights are under State workman's compensation statutes.

I would like to say that we are interested in your bill and in the

work of the committee in a broad way for another reason.

Witnesses, including the director of our rehabilitation commission and staff people from other agencies of the State, will speak specifically to you about details of the bill. Some may frankly differ with you on some aspects of it, but I would like in summary just to point out that we feel that this bill is more than just better living for the people who will be benefited by it. I personally think, and it is the feeling of the administration in New Jersey, that increasingly in

America and from America, comes the impression that we are a kind of materialistic people who may be more interested in how high the tail fins go on the new automobile than we are in some of these human values that have really been the strength of America over the

vears.

To the extent that you and your distinguished colleagues on this committee are establishing not merely a program of great personal benefit to people who need it most and for whom there has been too little spoken in the past, many of them finding their way into the custodial care and backwards of State mental hospitals, many finding themselves in perhaps adequately run, but certainly not rehabilitation oriented run homes in the State, we feel your attention to this will be more than just correction of that abuse and the correction of that neglect, but it will represent a symbol to all of us in New Jersey, in America, and, frankly, I might say around the world, that we still are human beings interested and human beings centered in our approach.

I hope I have stayed within my 10 minutes, Congressman, and I

hope your stay in New Jersey is productive.

Mr. Elliott. Thank you very much.

How many nursing homes do you have in New Jersey, Mr. Male? Mr. Male. There may be others who have the exact number. I believe nearly 200 that are licensed by the State.

Mr. Elliott. How many people live in those nursing homes?

Mr. Male. You will have a witness from the department of institution; may I yield to them on that.

Mr. Elliott. Our next witness is Dr. Kathryn Dice, representing the Department of Public Instruction, of the State of Pennsylvania and representing the Governor of Pennsylvania.

Dr. Dice, we are happy to have you. If you will proceed in any manner you desire and hold your testimony within 10 minutes, we

will appreciate it.

STATEMENT OF DR. KATHRYN DICE, FOR GOVERNOR OF PENN-SYLVANIA AND DEPARTMENT OF PUBLIC INSTRUCTION OF PENNSYLVANIA

Dr. Dice. Mr. Chairman, members of the committee, guests and friends of this committee, it is a source of personal privilege and pleasure to represent before this committee the Honorable David Lawrence, Governor of the Commonwealth of Pennsylvania, and Dr. Charles H. Boehm, superintendent of public instruction for Pennsylvania, as well as to appear in my own personal capacity as director of the bureau of special services to pupils within the State department of public instruction.

Our Governor sends to the committee his personal greetings and his regrets for his inability to attend, and commends the committee on its effort to approach the problems of special education and re-habilitation from the base of a body of factual material gathered from those most familiar with these problems at the State and local level, and from the point of view of the public as well as private

agencies rendering services to the handicapped.

The State superintendent of public instruction likewise sends his greetings and wishes to express to you his continuous interest in and concern for the handicapped and provision for their needs as re-

flected in the programs of public education.

We in the bureau of special services to pupils are also proud of this opportunity to share with you some data about the growth of special education services in Pennsylvania and to present to you the joint recommendations of our State government as well as those of our public school system.

In the Commonwealth of Pennsylvania the functions related to the handicapped are the responsibility, along with other matters, of three branches of our State government. Vocational rehabilitation services are a part of our department of labor and industry, and this group will be represented in subsequent testimony scheduled for tomorrow.

Institutional programs and mental services are the responsibilities of the department of welfare and, in the case of the delinquent and

predelinquent child, the department of justice.

Both of these branches of the State government in Pennsylvania will file with the committee written statements of their inability to be

present during the days of the hearings.

The day school programs for the handicapped are the primary responsibility of the department of public instruction and, since this is a source of personal interest to the Governor and since this is my own personal field of interest, I will restrict my testimony to this phase, hoping that my colleagues from the State will pick up on the other types of services for the handicapped within our State.

I would like to point out to you that Pennsylvania is very proud of the legal basis for its special education services throughout the Commonwealth. Since 1953 we have had State-mandated special education on a statewide basis, based on broad enabling legislation which limits us only to the broadest terms mentally and physically

handicapped.

For purposes of clarification, I would like to present to the committee as a part of an exhibit from Pennsylvania, and for inclusion in the record, a copy of our enabling legislation for class programs and a copy of a mandated transportation of the physically and mentally handicapped to education facilities, partly because we think this is a broadly permissive structure and because we were the first State in the Commonwealth to mandiate simultaneously both educational and transportation facilities.

Mr. Elliott. Without objection, the material to which the witness refers will be made a part of the record following her testimony.

Dr. Drce. I would also like to leave for reference purposes, if so desired, a copy of the school laws of Pennsylvania which will give additional services rendered through education to specific types of handicapped.

Next I would like to point out the impact of this legislation upon

the State of Pennsylvania.

Working with a State-mandated program providing both education and legislation has, of course, had a tremendous impact upon the public school program. This has made possible the coordination of health, psychology, and educational services into a cohesive program for the handicapped which was no longer restricted to institutions and sporadic programs, but could reach into every local district and

even into the home of the child.

Under the impact of this legislation we have developed full-time class programs for children with severe disabilities, mainly in the physical and mental areas, itinerent services for children with sensory handicaps mainly in the areas of speech, hearing, and sight, home instruction for children unable to attend school, and clinical and diagnostic services in preparation for and for the continuance of education and rehabilitation services.

In this connection I would also like to submit for use in the record, if so desired, a progress report of the development of these services indicating what has happened in the State of Pennsylvania since State mandated legislation and indicating in the lower areas the services which we feel we would need in order to give full State

coverage of educational services.

In connection with those, an actual breakdown of population served and a picture of a map showing the distribution of services through public education, our Governor is particularly proud of this because he feels that it represents a very wide layer of State coverage and services in this area.

Also, on the basis of such mandation public support of special

education programs are of great importance.

For this purpose we would like also to submit for the record this small graph which indicates tax support for the programs of special education which have grown in a 6-year period from a \$4-million-plus grant in 1955, serving 63,000 children, to a \$21-million-plus grant in 1959, serving 122,000 children, and for consideration and study this material which relates to per pupil cost on the basis of the kind of handicap.

Finally, for the record, an overall summary of the public school enrollments in the State of Pennsylvania from which one can see that of our school population of 1,900,000-plus practically 120,000 children, or 6 percent, of our school population are at the present time enjoying some type of special education services, either on a full-time basis, on an itinerant service, or on a homebound instruction

basis.

I would like to point out that this does not include the figures for institutionalized children which will be presented in subsequent testimony.

These special education needs, I think, point up also the needs in

the vocational rehabilitation area.

For while public education through its special education has certain opportunities and privileges and services to offer to the handicapped, it is the role of the vocational rehabilitation to pick up in the areas of later use and adulthood.

We know in Pennsylvania that we have many unmet needs. I would like to name four of these very briefly, because this will mark out the role and the recommendations which we would like to present

to you at the Federal level:

First, we need to know that we need to increase our full-time class

programs by about 20 to 25 percent;

Secondly, we know that we need to increase our itinerant services to children suffering from speech, hearing, and sight handicaps.

Here we are at the mercy of reporting and casefinding methods which is the problem of coordination of the functions of our own State government.

But I would like to point out the need for 100 additional speech therapists, 150 teachers for blind and partially sighted children, and

167 teachers for the deaf and hard of hearing.

Third, we in Pennsylvania as yet have no organized pattern of services for the socially and emotionally disturbed and we estimate our needs at 40 diagnostic teams and a minimum of 100 class facilities.

Fourth, we have no reimbursed program for the gifted. We know that these are a State responsibility to a large degree, but we feel these could and should be shared and, therefore, our present unmet needs are the basis for the following 12 recommendations before this committee.

1. We in Pennsylvania feel that Federal consideration should be given to support for teacher education programs, particularly in the

areas of critical shortage.

The training of supervisors in the area of mental retardation is

now available through Federal funds.

We believe this type of legislation should be extended to include classroom teachers and that this support should be given along two lines:

First, for basic certification in a special field, either educational or

vocational, as related to services to the handicapped;

Second, for others who with further training may wish to enter or

reenter teaching in one of the areas of handicapped.

We firmly believe that this extra training and this aid for teacher education should be directed to college and university programs solely and for this reason wish to go on record as opposing House bill 494.

2. Second, consideration should be given to Federal support for

the extension of vocational rehabilitation services.

In this connection we wish to voice our support of House bill 3465, and to suggest that consideration be given to the extension of vocational rehabilitation to the nonhandicapped, particularly adults who have never realized their potential who are ungraded vocationally and who have been deprived of or failed to take advantage of proper educational facilities.

This would be a true source of extending manpower and upgrading in a vocational and in a habilitation as well as rehabilitation sense.

In this connection also we want to solicit consideration of the term "employability," to broaden it and to extend it into other areas.

We wish to recommend Federal consideration to research and study through additional pilot programs, particularly in relationship to services for the socially and emotionally disturbed children and youth.

4. We wish to recommend Federal consideration for programs of

the gifted.

Specifically in extending title V of the National Defense Education Act into the elementary level and lending support to a changing concept of the definition of the gifted to include a given percentage of the school population rather than a ceiling in terms of measured mental ability.

5. There is need for further consideration at the Federal level for the educational and rehabilitation programs as related to migrant labor and non-English-speaking groups,

6. There is need at the Federal level for research toward the evaluation of present existing programs and the effectiveness of what we are

doing now.

7. There is need for direct financial aid for the establishment of regional libraries, curriculums and bodies of audiovisual aids, as well as demonstrating centers for teachers and counselors.

8. There is a need for publications from a general source for the

use of the general public as well as for professional use.

9. Consideration should be given to financial aid for ancillary services for education and rehabilitation, particularly clinical and diagnostic.

10. There is need for coordination, for distribution, use and employment of services including aids and devices for all types of handi-

caps such as are now made available to the blind and deaf.

11. There is a need to consider in proposed legislation at the national level relating to school buildings and school building needs, the needs of handicapped children as well as the needs of the nonhandi-

capped.

12. There is a need at the national level, as well as at the State and local level, for the closer coordination between special education and vocational rehabilitation services to eliminate overlapping, to cover the gray areas and to consolidate services for the handicapped into a life plan with direct aid for experimentation through pilot programs of coordination of services at the State levels.

We from Pennsylvania are grateful for this opportunity and are grateful for noting the awakening of national interest in these areas.

Mr. Elliott. Thank you very much, Dr. Dice.

May I say that the exhibits which Dr. Dice has offered will be made a part of the record immediately following her statement, without objection.

(The material referred to follows:)

WRITTEN STATEMENT BY L. KATHRYN DICE, COMMONWEALTH OF PENNSYLVANIA

Chairman Elliott, members of the committee, guests and friends of the committees, it is a source of personal privilege and pleasure to represent before this committee the Honorable David L. Lawrence, Governor of the Commonwealth of Pennsylvania, Dr. Charles H. Boehm, superintendent of the Department of Public Instruction for Pennsylvania as well as to appear in my personal capacity as director of special services for pupils of the State department of public instruction.

The Governor sends his personal greetings to this committee and to those assembled, regrets his inability to attend, and commends the committee on its efforts to approach the problems of special education and rehabilitation from the basis of a body of factual material gathered from those most familiar with these problems at the State and local levels, and from the point of view of the public as well as the private agency rendering service to the handicapped.

The State superintendent of public instruction, likewise, sends his greetings and wishes to express to you his continuous interest in and concern for the handicapped and provision for their needs as reflected through programs of public

education.

We of the bureau of special services for pupils are also proud of this opportunity to share with you some data about the growth of special education services in Pennsylvania and to present to you the joint recommendations of our State government and our public school system. In the Commonwealth of Pennsylvania the functions related to the handicapped are the responsibility, along with other matters, of three branches of our State government: (1) Vocation rehabilitation services are a segment of our State department of labor and industry; (2) institutional programs for mentally retarded children, mental health services and programs within correctional institutions are parts of the departments of welfare and justice; (3) day school programs for the handicapped and additional institutional programs for the blind, deaf and cerebral palsied are provided through the department of public instruction.

Through Mr. Charles H. Eby, director of the bureau of vocational rehabilitation, the nature and needs of this program will be presented in subsequent testimony.

Mrs. Ruth Grigg Horting, secretary of welfare will file with the committee for its consideration a written statement.

Since these two arms of State government are thus adequately represented I will confine my remarks to special education within the purview of the department of public instruction.

1. Legal basis for special education in the Commonwealth of Pennsylvania

Since 1955, by act of the legislature, Pennsylvania has had a statewide mandated public school program for mentally and physically handicapped children. In the same session of legislature, the provision of transportation for the handicapped to day school programs was also mandated. We believe in Pennsylvania that we are the first State to have simultaneous mandation of educational programs for the handicapped and transportation to these facilities. This type of legislation is an important indication of the interest of the general citizens and the legislature in the problems of its handicapped citizens.

For purposes of the record I am requesting that the following exhibits be included in the testimony of this witness and will leave with the secretary of the committee these exhibits; copies of act 429 of the General Assembly of Pennsylvania covering mandated programs of special education; act 673 of the General Assembly of Pennsylvania providing transportation for physically and mentally handicapped children; and copies of the School Code of Pennsylvania wherein are stated the additional provisions and extension of the services through public education to the handicapped.

2. Impact of this legislation

The impact of this legislation has been tremendous. For the first time it was possible within Pennsylvania to coordinate health, psychological, and educational services for the handicapped into a cohesive program so that special education could reach into every community and in some circumstances into the very home of the handicapped individual. Under this legislation, and dependent upon the nature and severity of the handicapping conditions, full-time class programs, programs of itinerant services, homebound instruction, residence programs, as well as clinical and diagnostic services have been made available. Suffice it to say in this oral testimony that as a result of this legislation services to the handicapped have tripled in size in the last 5 years.

To substantiate this statement and to present a comprehensive view of special education within the Commonwealth of Pennsylvania I am requesting that these additional exhibits become a part of the testimony before this committee: (1) a progress report of services to handicapped pupils, by category, showing the growth of programs since 1955, the projection of additional services for 1959-61 and the total number of estimated pupils to be served in each category; (2) a summary report of the number of pupils and programs in special education in the public schools of Pennsylvania, including current enrollment data; (3) a map of Pennsylvania showing where public school special education facilities are operated and indicating the areas of the State covered by such services.

3. Public support

We, in the Commonwealth of Pennsylvania, are pleased and proud to report that, under the leadership of our State government and legislature, State funds have been made available, since our mandated legislation, of adequate amount to permit the development of the much-needed facilities. To substantiate and extend this statement, I wish to provide for the record this graph indicating the biennial amounts appropriated by the State legislature for programs of exceptional children.

4. Per pupil costs

For purposes of the record also I wish to submit the following graph indicating comparisons between costs of educating handicapped children and normal children based upon the audit of expenditures for the school year 1958-59.

5. Overall enrollment

In order to enable the committee to compare the growth of special education programs with the overall of pupil enrollment in the public schools of Pennsylvania I am requesting that this summary of elementary and secondary enrollments be made a part of the record also. When these exhibits are compared it will be noted that 117,287 of the 1,914,496 public school children of Pennsylvania are participating in special education programs either on a full-time or partitime basis. In other words, 6 percent of the public school population of Pennsylvania receive services related to the specificity of their handicapping condition. These statements about special education are also of significance in evaluating the role of vocational rehabilitation services and indicate the extent to which such services are required to pick up the problems of the handicapped in later youth and adulthood.

6. Unmet needs

In spite of the rapid growth just described there are within the State of Pennsylvania four general areas of unmet needs as related to a comprehensive program for the handicapped. First, there is a need to increase full-time programs by the following amounts; for the trainable, 20 percent; for the mentally retarded educable of elementary school age, 25 percent; for the mentally retarded educable of secondary school age, 40 percent; and for the physically handicapped, including the sensory handicapped, 20 percent. Second, there is a need to increase itinerant services. In this connection the development of additional services is dependent on some improvement in our reporting and casefinding methods. However, we recognize the need for the services of 100 additional speech therapists, 150 additional teachers for the blind and partially sighted, and 100 additional teachers for the deaf and hard of hearing. Third, there is as yet no organized program or pattern of service for the socially and emotionally disturbed. A review of our public school population would indicate a need for 40 diagnostic teams and a minimum of 100 classrooms. Fourth, there is, as yet, no reimbursed program for the gifted.

We in Pennsylvania feel that these unmet needs are a State responsibility to a large degree. Their solution depends to a large degree on space, teachers, and continued financial support. We do feel, however, that some of them could and should be shared. Therefore, our present unmet needs become the bases for the

following recommendations.

7. Recommendations

1. Consideration should be given to Federal support for teacher education programs in all areas where a critical shortage of teachers now exists. In the area of mental retardation the training of supervisors is now made available through Federal grants; such aid should be extended to classroom teachers in all areas of critical shortage. This support should be along two lines: to aid in the attainment of basic certification in a special field, either educational or vocational, and to others, who with further training may wish to enter or reenter teaching or counseling in one of the areas of the handicapped. In this connection it is necessary for us in Pennsylvania to oppose House bill 494. This may seem odd in that it sounds as though we oppose Federal aid for the preparation of teachers of the handicapped. This is not true, but we do oppose fragmentizing Federal aid for the teachers of the handicapped and believe such aid should be made available for all critical areas; that the administration of such aid should be within the U.S. Office of Education rather than the Office of Vocational Rehabilitation; and that all grants should be to college and university programs rather than residence schools.

2. Consideration should be given to additional Federal support for the extension of vocational rehabilitation services. In this connection we wish to voice Pennsylvania's support of House bill 3465 and to suggest two other ways in which we feel vocational rehabilitation services could be extended. There should be an extension of the term "employability" and a consideration of the extension of vocational rehabilitation services to nonhandicapped individuals. As an example there may even be gifted adults—those who never realized

their potential, those who are undergraded vocationally, those who have been deprived or failed to take advantage of proper education—such citizens also require and need vocational rehabilitation services.

3. Consideration should be given to research and study through additional pilot programs of the educational problems and needs of socially and emotion-

ally disturbed children and youth.

4. Consideration should be given to two aspects of educational programing for the gifted; a change in title V of the NDEA Act extending guidance facilities into the elementary school, particularly those related to the identification of the gifted; and to a changing concept of the gifted, away from a "floor" in terms of measured mental ability and toward the concept of a given percentage of any school population.

5. Federal consideration should be given to the educational problems of migrant labor, both children and adults, with particular emphasis upon non-

English speaking groups.

6. There should be continued national research toward the evaluation of present programs of both special education and vocational rehabilitation.

7. Direct financial aid should be considered for the establishment of regional libraries, curriculum studies, audiovisual aids, as well as demonstration centers for teachers and counselors of the handicapped.

8. The preparation of publications for use of the general public as well as for professional use is another necessary extension of services to be considered.

9. Consideration should be given to direct financial aid for ancillary services.

particularly clinical and diagnostic.

10. There should be further coordination for distribution use, and improvement of services through aids and devices for all types of handicapped such as those now available to the blind and the deaf.

11. Proposed Federal legislation in regard to school buildings should take into account the needs of the handicapped as well as the nonhandicapped.

12. At all levels there should be closer coordination of special education and vocational rehabilitation services to eliminate overlapping, to cover the "gray areas," and to consolidate services for the handicapped into a life plan, with direct aid for experimentation through pilot programs of coordination of services at the State level.

Personally, may I again express my gratitude for this opportunity to speak for the Commonwealth of Pennsylvania in regard to these very important issues and to note with personal and professional pride the awakening of national interest in these areas.

Mr. Elliott. The gentleman from Minnesota, Mr. Quie.

Mr. Quie. Do you also have a report to substantiate further those 12 points that you make, background material of why you make those statements? If you do not, I would like to visit with you afterward.

Dr. Dice. I will be glad to visit with you afterward anyway. I think the material which I submitted on education will support the

statement I have made.

The written reports from our department of welfare will pick up on the aspects of welfare and vocational rehabilitation from our State, will give subsequent testimony which will support their point of view.

Since I was the representative of the Governor we felt it advisable in working out our testimony that all the recommendations be made

at once with substantiating data to appear later.

Mr. Elliott. The gentleman from Connecticut, Mr. Giaimo, has a question.

Mr. Giaimo. Dr. Dice, you mention the four needs in this area that presently must be met. I gathered that you feel there must be Fed-

eral assistance in meeting these four needs. Is that correct? Dr. Dice. I presented those four unmet needs as our needs as far

as the State is concerned. We feel we have certain responsibilities along these lines.

The actual provision of educational facilities for these types of children we feel, is our State responsibility. We do feel that in order that the State can carry its share of the responsibility the kinds of aid which I have suggested from the national level would make program making easier and quicker in these particular areas.

Mr. Quie. I did want to make that clear, that you are recognizing

the responsibility of the States, also, in this field.

Dr. Dice. Right; very definitely. I think this is a shared responsibility.

Mr. Elliott. Thank you, Dr. Dice. Your testimony will be very

At this time I have a telegram from Mr. William J. Jones, Administrator of Union Essex Institution of Elizabeth, N.J., saying that due to circumstances beyond his control he is unable to appear before our committee on Thursday, and he wishes to express his regrets and to express appreciation for our invitation.

I quote from the telegram:

I certainly endorse the principles to which your group is dedicated in seeking to expand aid to the handicapped and trust my inability to attend will cause you no inconvenience.

It is signed "William J. Jones."

Mr. Elliott. It has been called to my attention that the president of the Jersey City Board of Education is in our audience. I am

going to ask Congressman Daniels to present him for a word.

Mr. Daniels. Mr. Chairman and colleagues, I note in the audience a representative from the Jersey City Board of Education, President John Sheehan, a distinguished businessman and mechanical engineer by profession.

Having been born and reared in Jersey City, personally, and being a product of the Jersey school system, I am naturally very proud of our school system, and also of the many facilities and services that our Jersey City Board of Education provides in the field of special edu-

cation and rehabilitation.

I am quite sure that Mr. Sheehan, as president of the Jersey City Board of Education, will have a fine message for the benefit of this subcommittee's study.

I am privileged to present to you Mr. Sheehan.

Mr. Elliott. We are very happy to hear you, Mr. Shechan. We appreciate your coming down.

STATEMENT OF JOHN SHEEHAN, PRESIDENT, JERSEY CITY BOARD OF EDUCATION

Mr. Sheehan. I have a statement that I have written up in a hurry. I can give it to the reporter if you don't want me to read it.

Mr. Elliott. You may read it if you care to.

Mr. Sheehan. It is just the philosophy of the board with the idea of our social feeling in this whole field of educating the children, retarded children.

But in order not to take up too much time, I will give the reporter

that philosophy.

(The statement referred to follows:)

STATEMENT OF JOHN SHEEHAN, PRESIDENT, JERSEY CITY BOARD OF EDUCATION

In dealing with the social question, many people are still far too much in-

clined to regard it simply as a problem affecting the workingman.

The word "social" refers to whatever is connected with "society" in the community and this has reference to all of the members of the community. Within a country, the social problem comes nearer to a solution in proportion as the citizens have a chance to carry on the work that is suited to their ability and are enabled to secure for themselves such a share of the fruits of the common activity as corresponds to their real needs. We see, therefore, that the social question is not limited to the interests of a single class in the various countries, but involves the creation of such a healthy order in the national life as a whole as will be of service to all of the citizens.

Real social progress consists in making it possible for all to have access to the vital members which have been called the initial equipment without which a man cannot go forward to the fulfillment of his destiny and which are related

to the basic elements of the law of life.

All man stand in need of (and are entitled to) such health care as is scientifically and technologically possible. This involves the problem of social health services such as will enable everybody to get the treatment they need. All must have a chance and the means to obtain the kind of training that is suited to

their respective aptitudes.

Here we are faced with the democratization of education. Those benefits are not meant to be the privilege of a minority but must be the heirloom or prerogative of all men. For the first time in history the more advanced societies can provide all that is needed to attack the social problem in its broadest meaning. It is not surprising, therefore, that in those countries the problem of vital necessities for all of the people has given rise to a "grande politique" concerning a better distribution of national income, the creation of social health facilities and the steps required to provide all of the children with the kind of education that is suitable to them.

Mr. Sheehan. I would like to talk to you just off the cuff about a situation that I think has developed and is developing throughout this State. I don't know whether it has developed all over the country or not.

But I think we have a much better opportunity to talk about what has been done for this type of child than probably any other commu-

nity that I know of.

I don't know if you know, but we have a special school on the boulevard, which is across the street from the Jersey State Teachers College, called the A. Harry Moore School, which was named after our former Governor, A. Harry Moore.

This school was established in 1921 and it is a public day school for the physically handicapped, from the kindergarten through grade 10.

The enrollment in that school runs in the neighborhood of 300 chil-There are cerebral palsy cases, 93; general orthopedic, around 100; and cardiopathic runs in the neighborhood of a hundred pupils in this particular school.

Now, the services are elementary and secondary curriculum; they have home economics, industrial arts, mechanical dentistry, power sewing-machine operation, watch repairing, special typing, guidance clinic, physical therapy, occupational therapy, speech therapy, physical education, muscular therapy; and we also have a summer camp for them and we also have job placement.

The school hours are from 8:30 to 3:15 a day.

Now I would like to tell you that in addition to the A. Harry Moore School in the year 1958-59 we had 24 special classes scattered throughout the city in the various schools, and this year we have increased it by five more classes; we have 29 classes.

These cover the educable mentally retarded, the trainable mentally

retarded, deaf, hard of hearing, blind, and partially seeing.

So that in our entire system we have a little over 32,000 children, and covering the A. Harry Moore School and in these classes that we have in these schools we have about 700 children that we cover every day from around 8:30 to 3:15.

Now I would like to tell you what it costs us. It costs us alone in

the A. Harry Moore School in the year 1958-59, \$455,814.

In the other children that we have scattered around the various

schools our costs there were \$305.512.

Now, this year we will have five additional classes, which will cost about \$12,000 a class, which will increase that cost \$60,000, and we gave on July 1, 1959, an increase in salary to the teachers of these children of \$23,600, which brings our total cost to \$912,040, for all of these children.

In addition to that, I might say to you that we take approximately

100 children from the other communities.

You probably know that a town like Ridgewood is a very wealthy town; a town like Montclair is a very wealthy town. They send pupils to us for these courses because they do not have the facilities.

Now, the main reason why I bring up the cost of this particular program here is the fact that this is budget time, and we are being attacked indiscriminately, I would say, by very powerful forces as to the cost of our educational system.

As you probably know, this city is governed by five commissioners. Two of these commissioners have been against any increased cost in the school system and have been attacking it.

In fact, one of them, Commissioner Murray, at this school board

meeting, last week-

Mr. Daniels. Pardon me, Mr. Sheehan. I do not think that this would be an appropriate forum to discuss personalities. If you desire to furnish the members of the committee with testimony as to the costs of special education classes, the cost per pupil (I was quite fascinated by the figures you mentioned this morning and I intended to ask you several questions with regard thereto), you may do so, but I would respectfully ask you to refrain from engaging in any discussion about politics in Jersey City so far as that affects our Jersey City school system, because I do not think that is any concern of this committee.

This committee is interested in the unmet needs in the fields of special education and the problems of rehabilitation and not in any matter which might concern the citizens of Jersey City with respect

to its political problems.

Mr. Sheehan. All right.

Mr. Daniels. I trust I am in order, Mr. Chairman.

Mr. Elliott. You may proceed.

Mr. Sheehan. The point that I would like to try to get over without bringing in personalities are things that I feel as president of the board I should lead and you as Congressmen should lead to because I think this is attack on the cost per child.

Now, I do agree that the real estate throughout the country, the people who own their homes and the plants and all, are paying in taxes to support these children. I think that we probably could get

some relief from the Federal Government.

As Governor Rockefeller mentioned, if we could get the 10-percent

tax on the telephone it would help this problem.

But, you see, you have people combating this and you also have the apathy of the people; I mean the parents do not seem to have too much interest in this whole program.

They just are apathetic about it. We just recently had a book fair where we bought a tremendous amount of books, in fact, we bought

\$5,000 worth of books alone for the A. Harry Moore School.

We invited the parents to come every day and to come at night to see them. It was really terrific; hardly any parents showed up.

I mean there is an apathy. So that in trying to put this program over that you want to educate these children so that they can be fitted for their place in society and the general run of people, and the parents in particular do not seem to have any interest in helping them.

Now, we are faced with the situation that this program costs us, our budget runs between 14 and 15 million dollars, and we are spending approximately a million dollars on this program alone, from these figures, but this does not cover all the cost.

The attendant cost for that school and part of the bus transporta-

tion are not included in these figures.

Now, for us to stand here and try to make this program grow and take in more children, we have to combat the cost. Of course, I will agree that they have many, many arguments in their favor, that the property should not have to bear the total cost, the real estate taxes should not have to bear the total cost.

I think the Government should help out in the program.

Mr. Elliott. May I ask you, Mr. Sheehan, do you have any figures as to the number of handicapped children who are not now served by special educational classes in your city?

Mr. Sheehan. Yes, I have the total.

Mr. Elliott. Will you make those figures available for our record immediately following your testimony?

Without objection, the figures which you have will be made a part of our record for further consideration.

(The figures referred to follow:)

A. HARRY MOORE SCHOOL. Jersey City, N.J.

Physical therapy Occupational therapy Speech therapy Physical education Musical therapy Summer camp Job placement

School hours, 8:30 to 3:15.

Mr. Sheehan. Another thing I might tell you that across the street from the A. Harry Moore School, we have the Jersey City State Teachers College. Last September they were able to start a new course in the State of New Jersey. They are now giving a course for teachers to be trained in handling this type of child and they will be able to certify them at the end of 4 years to teach mentally retarded children and they are using the A. Harry Moore School as a workshop for these teachers.

It just so happens that this is the only State teachers college in the State of New Jersey that has a school like this across the street so

that they are able to do it.

So we are very happy to cooperate with the State and let them use our facilities as a workshop.

So we do not want to give this up; we want to hold on to it and make it even better.

I feel that you and I have to lead. Even if we turn around and no one is following us, we have to keep going forward and doing some-

thing for these children.

As I say, we are attacked on the basis that our cost per child is high, but when you look at this deal alone it is costing us in the neighborhood of \$35 to \$40 a child to educate these children, I mean if we did not do it we could reduce our cost per child from say, \$450 down to about \$410, and, therefore, you cannot compare the cost per child in this city with other towns that do not give this service.

It is not a fair comparison. So I cannot tell you too much.

If you would hear as a witness today, I would like Miss Thompson, who is principal of the A. Harry Moore School, to talk to you about her particular problems.

Mr. Elliott. Is Miss Thompson on our list of witnesses?

We will be glad to hear Miss Thompson at some point during the

hearings.

Mr. Sheehan. I would like to close 1 more minute by saying to you this, that there is one thing that everybody is concerned about. I understand from Miss Thompson that the people in Pennsylvania

and the surrounding States are also worried about it.

It is a very difficult thing to get therapists for this school. I understand it is difficult in Pennsylvania, in New Jersey, New York, and if the Government could do something toward subsidizing some sort of school or recruiting of people to take up this physical therapy we could use many more people in the A. Harry Moore School, but we have a very difficult time trying to find people who are trained for that.

Miss Thompson tells me that there are some schools, but they haven't any people to give us, they already have been contracted for.

There is another thing in the laws that these people are offered usually a very low wage. There is a big argument against paying them a starting salary comparable to what a teacher would get. Although they are not educated in Brahms, Beethoven, mathematics, or chemistry; they are trained in a particular field that is quite necessary for these children.

We are all working under a handicap. So when you are thinking about legislation if you could devise some type of program where you could recruit people for this and subsidize training schools, even if we try to set up here in Jersey City in our medical center a sort of little school to train these people, and also help us toward subsidizing the cost of paying these people.

Mr. Elliott. The gentleman from New Jersey.

Mr. Daniels. I believe you testified that there are approximately 300 students in the A. Harry Moore School?

Mr. Sheehan. Yes.

Mr. Daniels. They are suffering from various disabilities, physical, heart, coronary and speech defects, hearing, and so forth?

Mr. Sheehan. Yes.

Mr. Daniels. How many teachers do you have in that school and

in what areas do they teach?

Mr. Sheehan. We have 16 that cover general orthopedic. This is in 1958-59; five in cerebral palsy; eight in cardiopathic. We have 15 in educable mentally retarded.

We have nine in trainable mentally retarded.

Two for the deaf; one for hard of hearing; one for blind, and two for partially seeing.

Mr. Daniels. What is the approximate size of each class?

Mr. Sheehan. That I could not tell you. I think it varies under the State law, that you can have, say, only so many deaf per teacher.

Miss Thompson could supply that answer.

Mr. Daniels. In the year 1958-59 they had 24 classes throughout the Jersey City school system which was subsequently increased by 5 and that the total cost of the A. Harry Moore School for these 29 classes amounted to approximately \$912,000.

Mr. Sheehan. That is right.

Mr. Daniels. That does not include the cost of transportation of

these students to and from school?

Mr. Sheehan. The reason I do not include that, we get about 75 percent of that back from the State on the buses, so we don't include that.

Mr. Daniels. Do these figures encompass the entire disabled stu-

dent body of Jersey City?

Mr. Sheehan. I would not say that it covers them all.

Mr. Daniels. Are there some students that receive home care, home study?

Mr. Sheehan. We have a home instruction course, too.

Mr. Daniels. That is in addition to these figures?

Mr. Sheehan. That is in addition to these. And hospital instruction, too.

Mr. Daniels. From your experience, do you find a shortage of

specialized people in these various fields?

Mr. Sheehan. That is right. But this is being helped now by this new course at the Jersey City State teachers which started last September.

But the State of New Jersey won't feel the impact of that until about 4 or 5 years from now, because this is the first course that started

and it lasts 4 years.

Mr. Daniels. Does the State of New Jersey give any aid to the local boards of education with respect to these particular areas of special education?

Mr. Sheehan. They do, but it is very minute.

These figures that I give you are the figures that we pay, ourselves, without any aid. That is why I did not include transportation.

Any aid that is given us is subtracted and is not in these figures. Mr. Daniels. What is the per pupil cost in this special area?

Mr. Sheehan. In general, orthopedics the per-pupil cost runs around \$1,349, cerebral palsy runs around \$1,649. Cardiopathic runs around \$1,450. Educable mentally retarded, \$954. Trainable mentally retarded, \$1,234. And the deaf, \$1,335. Hard of hearing, \$1,280. And the blind, \$1,926. Partially seeing, \$850 per child.

Mr. Daniels. Per annum?

Mr. Sheehan. Yes.

(Table submitted by Mr. Sheehan follows:)

1958-59 cost per pupil by type of class, day school only

¹ Academie, ² Industrial,

Mr. Daniels. How do those figures compare with the normal

student?

Mr. Sheehan. In 1958-59 our average cost was \$450 per pupil. That included this, so if you quickly subtracted the \$912 from our total budget and divided by the total number of children, I would say you would reduce that \$450 figure in the neighborhood of \$35 or \$40.

In other words, you would reduce it from \$450 to about \$410.

Mr. Daniels. From your testimony I take it that there is a dire need of assistance to our local boards of education from other areas, either State or Federal?

Mr. Sheehan. Right.

Mr. Daniels. And that there is a great shortage of specialists in the various fields of therapy as well as teachers for these groups?

Mr. Sheehan. I would say physical therapists is the biggest need and then the need of training and certifying teachers for this program is big, too, but that is being corrected now by this course, as I said before, in the Jersey City State Teachers College.

Mr. Daniels. I have one further question, Mr. Sheehan: Do you have any difficulty in recruiting teachers in these special areas by reason of the fact that the compensation is not sufficient, or adequate?

Mr. Sheehan. Well, we have not had any problem there. The thing that amazes—it does not amaze me, becauses there are a great many people, as you know, Congressman, that are dedicated people, and we have a great many teachers that are dedicated and the fact that you give them a raise or you don't give them a raise does not make any difference to-

Mr. Daniels. I do not mean on that score. Is our pay scale here

in Jersey City comparable to other areas?

Mr. Daniels. We do not experience difficulty in acquiring the necessary specialists in these areas by virtue of the fact that our pay scale is inadequate; is that true?

Mr. Sheehan. The only field that I would say it is inadequate and that is in the physical therapists and they are not teachers. That is where it is inadequate.

Mr. Daniels. Thank you.

Mr. Elliott. The gentleman from Minnesota, Mr. Quie, has a

question.

Mr. Quie. You did not state specifically how much aid you received. Could you give this? Is it an amount so many per pupil? How do you receive the aid from the State?

Mr. Sheehan. We receive the aid from the State in specific areas. For instance, bus transportation for these children, they would give

us 75 percent of it.

But that does not amount to too big a figure.

Mr. Quie. You say 75 percent does not amount to too much?

Mr. Sheehan. That is right. This is a city and they don't have to travel too far on the buses.

Mr. Quie. They pay 75 percent of the transportation cost? Mr. Sheehan. Yes.

Mr. Quie. Discounting transportation cost, what other State aid do you receive for education of your children?

Mr. Sheehan. I would say in our home program—you catch me unawares on this figure—it would run a couple of million dollars.

Mr. Quie. Is this according to State law so much per child, or how

is it determined?

Mr. Sheehan. It is determined by different areas, like, for instance, if you have a course like we have at one of the schools at night, teaching Americanization courses, they allow you so much money for that.

Mr. Quie. I mean for the handicapped children.

Mr. Sheehan. You are talking of handicapped only?

Mr. Quie. Yes.

Mr. Sheehan. The amount is very small. I would say that offhand the bus transportation—

Mr. Quie. Not transportation, but discounting transportation, what

State aid do you receive for the handicapped?

Mr. Sheehan. I can get the figure for the committee and send it up

Mr. Quie. But there is some?

Mr. Sheehan. There is some. Mr. Quie. Are there any students outside of the school district who

are handicapped who go to your school?

Mr. Sheehan. There are approximately a hundred that come from outlying Montclair, Ridgewood.

Mr. Quie. That means that they do not provide that kind of classes

in Montclair and Ridgewood?

Mr. Sheehan. That is right. They send them here.

Mr. Quie. They pay the cost of education for the handicapped?

Mr. Sheehan. We charge them a tuition fee.

Mr. Quie. So for anybody out of the district, there is no added

expense to you?

Mr. Sheehan. Well, it is because, Congressman, the amount of tuition that we charge these towns has been a great deal less than Mr. Quie. Why don't you charge them the full amount of the cost?

Mr. Sheehan. Well, we did move it up a little bit this year toward You know, sometimes it is a kind of shock to them if you try to give it to them all in one year, but we have been gradually now in the last year trying to move it up more toward that cost because they have budget problems, too.

So we have to recognize that we have our budget problems, so we recognize that they have theirs. So we just try to say to them, well, can't we move it up a little bit this year and maybe the following

year move it up a little.

Mr. Quie. Are you prevented at all by State law from charging the full amount of the tuition?

Mr. Sheehan. No.

Mr. Daniels. Mr. Sheehan, on that question of cost charged to the other municipalities for their students, is there any particular reason why Jersey City should subsidize the public communities in the education of their handicapped?

Mr. Sheehan. No, there isn't.

It so happens that this school has been such a wonderful school and so recognized all over and there has been a sort of attitude that if somebody came with a polio case or cerebral palsy case, that if there was an opening they did not want to deny it to those communities if they had room for them.

Mr. Daniels. Approximately what do you charge these other com-

munities for the tuition in education of special children?

Mr. Sheeman. It was under a thousand dollars, but we have moved it up to, for instance, cerebral palsy where it costs us \$1,650, we have now this year moved up to a tuition cost of \$1,300. So we are \$350 a child under what it costs us in that area.

But that has been a gradual moveup. It was much lower than that. Mr. Quie. Are there any other school districts in the State that

provide special classes in the public schools for handicapped?

Mr. Sheehan. I think there are, but I could not tell you because I am not technically equipped to give you an answer. I think Newark does.

Mr. Quie. Now, for the teacher-training course in the teachers college: This is only for teachers of the mentally retarded. Is that

right?

Mr. Sheehan. This program would cover all the types of children

that are in the A. Harry Moore School.

Mr. Quie. You mean the teachers-training course in the teachers

college is training teachers for all the handicapped?

Mr. Sheehan. My understanding is—I think it would be better if you could get the courses of study from Dr. Gilligan, who is president of the Jersey City State Teachers College.

You see, I don't know whether it covers all of them. I thought it did. When we made the agreement to let them have the school, to use as a workshop, we agreed that they could give all the courses they wanted there.

Mr. Elliott. Thank you very much, Mr. Sheehan.

I neglected to say earlier that the clerk of our subcommittee is Dr. Harry Barnard. Dr. Barnard is here in this room. If anyone

has business with the subcommittee, they can contact him.

Also, we are assisted by Miss Alice Hartman. Miss Hartman is here at the table at my left, an employee of the subcommittee, and those who have business with the subcommittee may talk to Dr. Barnard or Miss Hartman, either one, or both.

Also, Congressman Daniels' aid, Mr. Obendorf, is here and also Mr. Griffin. These gentlemen are aids of Congressman Daniels and

they are available also to aid the hearings as we proceed here.

I would like to be peak my thanks for their aid and service in this

endeavor.

Our next witness is Mr. Jack Matthews, chairman of the Speech

Department of the University of Pittsburgh.

Mr. Matthews, if you could summarize your statement and then submit your written statement for the record, it would be helpful to us in trying to meet our time schedule. At this time I am going to ask Congressman Daniels, the ranking member of the subcommittee present, to preside.

Congressman Daniels.

Mr. Daniels (presiding). Mr. Matthews, you were due here earlier this morning—

Mr. Matthews. I am sorry, I just arrived about 15 minutes ago. Mr. Daniels. Because of the fact that we have scheduled 30 witnesses to testify here today and time is running along and we are about an hour behind schedule now, I must limit the testimony of each wit-

ness to no more than 10 minutes.

If you have a prepared statement and desire to submit the statement and summarize the views expressed in your statement, you may do that, or you may proceed with the statement, but I will have to limit you to no more than 10 minutes in your testimony.

Mr. Matthews. I understand.
Mr. Daniels. You may proceed.

STATEMENT OF JACK MATTHEWS, CHAIRMAN, SPEECH DEPARTMENT, UNIVERSITY OF PITTSBURGH

Mr. Matthews. First of all, I want to express my appreciation from someone interested in special education for the real contribution that I think your subcommittee is going to make to our field.

I don't know of any time in the history of our field when such a soul-searching look has been taken at the needs that exist in this par-

ticular field.

You gentlemen already have lots and lots in the way of statistics, facts, and figures, and more will be submitted in writing as these hear-

ings go on.

I would like to talk not so much in terms of statistics, I would like to talk in terms of people, in terms of some of the human values that I happen to be interested in as someone who has worked in the broad field of rehabilitation and special education for about 20 years.

The viewpoints that I am expressing are those which I personally have as a father, as a professional person who has been training people in the area of rehabilitation and special education for a number of years, as well as a member of a number of professional organizations

interested in this field.

I don't for one moment want to say I am speaking officially for the American Association for Cleft Palate Rehabilitation or the National Association for Retarded Children, or the American Speech and Hearing Association, or the Pennsylvania Speech Association, or any of these other organizations to which I belong, and which I have had the honor of serving in various offices and various capacities.

But the statements I do want to make I think will reflect pretty largely the points of view of my professional colleagues, particularly

in the State of Pennsylvania.

I currently am serving as president of the Pennsylvania Speech Association and although we have not taken any official action in terms of the subject matter under discussion today, I do think that I can fairly accurately reflect the views of a number of these organizations and these workers.

If I were to summarize the views of these people, I would say that it would boil down largely to this fact: That we have today in the area of common disorders—I am speaking now of speech and hearing disorders, about which we have a great deal of knowledge and information that is available to us that can be used to help handicapped children and adults in the field of speech and hearing disorders.

But the disconcerting thing, the frustrating thing to those of us in this field is that although we have the know-how to help many individuals, we don't have enough hands to provide the services that are needed.

Specifically, let me give you some illustrations of the kind of things that happen to me day in and day out at our clinical facilities at the University of Pittsburgh where we are training a fairly large number

of people to go into various aspects of special education.

Two days ago a woman came in from about 75 miles from Pittsburgh, tears in her eyes because her husband, a chap not much older than I, had had a heart attack. As a result of this he was aphasic. There was not a speech pathologist within 80 or 100 miles of this particular person to help this individual to regain his speech in order that he could stand on his own two feet, earn a living, and resume normal activity.

Had that person been in the city of Pittsburgh where there were clinical facilities, where there were adequately trained people to help, there was a good chance he could have been restored to a useful produc-

tive life.

The same sort of thing happens day after day.

When we see children coming from the outlying sections of Pennsylvania, from rural communities, or from smaller communities where there are not adequate services for speech and hearing handicapped, we are forced day after day to say to these people, when they ask, "Can't you do something," we say, "If you were here close to our clinic we would be glad to help you. We would love to be of some service."

Then they will say, "Can't you refer us to someone in our own home

community?

Time after time we are forced to say, "We are sorry; there is no one there."

This is not because the local communities are necessarily uninterested in providing the service. It is not because the local community is lacking in funds, but it is this old bugaboo that comes up in every one of these areas, the matter of personnel.

I just completed a term as president of the American Association for Cleft Palate Rehabilitation, an organization made up of surgeons, of dental specialists, special therapy people, psychologists, interested

in rehabilitation of cleft palate individuals.

Time after time we are confronted throughout the country in our clinic facilities where excellent surgical results have been accomplished, where the dentists have done a fine job and now what is left is the rehabilitation to be carried on by the special specialists.

Time after time we are confronted with this same problem that I just mentioned; we don't have the trained personnel to do the job.

Mr. Daniels. Is that due to a shortage of teachers in that particular

Mr. Matthews. Very much so, sir. It is a matter of—roughly, our best national estimates say that we need approximately 20,000 speech pathologists to perform the bare necessities of rehabilitation work in the speech field for children and adults.

Mr. Daniels. How many are available?

Mr. Matthews. We have about 2,000 qualified people in the country today. We need about 1,500 new people to be trained each year to replace those who leave by marriage, retirement, and so on.

We are turning out 400. Now, those folks who will probably testify later on today about the needs in cerebral palsy, about the needs in the area of mental retardation, I am sure will agree with me that many of these youngsters or many of these adults with these afflictions also have speech problems.

Roughly two-thirds of our cerebral palsy individuals will have speech disorders. A very high percentage of mentally retarded have

both speech and hearing problems.

Now, these individuals have a couple of strikes against them. The mental retardation plus the speech problem can be a real, real serious

problem.

On the speech handicapped can be the difference between mentally retarded person making some kind of adjustment in the community and not making the adjustment and staying on the relief rolls or on the county welfare rolls for the rest of his life.

Now, I do not think it is necessary to belabor this particular point. It is not unique in the field of speech, certainly. I am sure you will find this same sort of thing existing in most of the specialty fields you

will be dealing with today.

I think the thing to ask, at least the thing we have been asking ourselves, is what are we going to do about it. We have tried in our own particular training center at the University of Pittsburgh to secure outside funds from various sources, from public and private agencies, to provide scholarships and fellowships to encourage people to come into this field.

We had some success with this.

In a matter of a few years with the outside financial aid we have been able to build our program from one which enrolled about 8 or 10 graduate students 6 or 7 years ago, to the point where today we have approximately 45 graduate students enrolled in this program.

These people that are being trained are going out and are helping to meet some of the needs, but we have to do a much better job of recruiting, we have to entice a great many more competent people

to this field

One of the things that I am encouraged by is the proposal which came out of one of the members of your committee, Congressman Elliott's 494 bill. It seems to me that takes a most intelligent approach to this particular problem because it gets right at the crux of the problem.

That is the providing of more hands, of more trained personnel, and it gets at that, I think, in a very effective way by providing financial inducement to training centers to set up programs in this area and also provides inducement to competent young people to

come into the field.

One of the concerns that I have is that out of the work of this particular committee, I am sure that there is going to come some very, very fine things. I would hope that we would not have to wait too long before action could be taken on 494 because I think here we have identified a need in the area of common disorders, in the area of speech, in the area of the hearing handicapped.

We know what the needs are here. The needs are terrific.

We have in the United States today approximately 70 accredited training centers that are ready at this particular point to step up their training programs when they get additional students or when they get the necessary financial resources to implement their programs. These are accredited schools.

We don't have the problem that we have in some other areas of special education, of deciding now what constitutes an accredited

program or what constitutes certification, and so on.

These problems have been worked out in this field and I think that if 494 could be made into reality today it could go a long way toward meeting the needs of individuals with speech and hearing handicaps.

When we are meeting these particular needs we are meeting the needs not just of the individuals who have speech and hearing problems, but we are meeting the needs, part of the needs of the cerebral palsy individuals who have common disorders, we are meeting some of the needs of the mentally retarded who have common disorders.

So briefly, gentlemen, from the experience that I have had in the area of special education, from the contacts that I have had with professional organizations wrestling with these problems, I would see our crucial need here as that of a need for more personnel in

the field.

I think the way to solve this particular problem, or, at least, one of the most effective ways of solving it is the procedure which has been suggested by Congressman Elliott in House Joint Resolution 494.

It is my hope and it is the hope of my professional colleagues from the State of Pennsylvania, that 494 will receive favorable action in the very, very near future so that the 70-odd training centers in this country who are prepared to train qualified people in speech pathology and audiology, can begin to get started on an expanded program so that we can begin to more adequately meet the needs we have in this field.

Mr. Daniels. Thank you, Mr. Matthews.

Do you desire to ask any questions?

Mr. Giaimo. On House Joint Resolution 494, I get the impression from you that there is great need for it and the whole country is waiting for the Federal Government to come in and participate with House Joint Resolution 494. What would happen if it were not to pass? What would the States do?

Mr. Matthews. As far as the State of Pennsylvania is concerned, and I cannot speak for the other States, I think some nice sounding

words would be recited.

For example, we have had a Governor's commission that has done an excellent job trying to find the needs in the State. Actually, it has been doing on a small scale what your committee has been doing on the national scene.

But as far as implementing that in terms of providing funds, I am very, very pessimistic that anything would come out of this in our

particular State at this particular time.

Mr. Glamo. Then it is your feeling that unless the Federal Government passes something such as House Joint Resolution 494, it is very doubtful if there will be any progress in this much needed field; is that right?

Mr. Matthews. I would say that the progress would be very, very slight. For example, if an interested citizen in Pennsylvania is willing to give a scholarship to support one graduate student or United

Cerebral Palsy provides some money to train one or two people, or the Crippled Children's Society does the same sort of thing, this is a very, very slow process and extremely frustrating to those of us in the field who know if we had more hands we could help more people.

Mr. Giaimo. Thank you. Mr. Daniels. Mr. Quie?

Mr. Quie. Does this mean that it will be easier to convince the Congress of the United States of the need than the Legislature of the State

of Pennsylvania?

Mr. Matthews. Frankly, I would say yes. I think the history of social legislation in the last few years, particularly some of the measures that some of you gentlemen have been connected with, leads me to be more optimistic as far as the Federal Government is concerned, than my own State legislature at this particular time.

Mr. Quie. I will say of the State of Minnesota Legislature that I think we have forged ahead in the last few years probably faster than

the rest of the country.

Mr. Matthews. Yes, particularly in the area of mental health, you

have been leading the Nation.

Mr. Quie. How many institutions will train speech pathologists and audiologists in the State of Pennsylvania—just the University of Pittsburgh?

Mr. Matthews. No, at the present time there are graduate training programs at the University of Pittsburgh, University of Penn-

sylvania, Temple University, and Penn State University.

There are undergraduate training programs at approximately a

half dozen smaller schools.

Mr. Quie. In other words, a greater portion of the speech pathologists and audiologists are trained in Pennsylvania than, we will say, in the average State in the country?

Mr. Matthews. Yes, than in the average State, but a much smaller number than would be trained in some of the Western and Mid-

western States.

It happens that this is a field which developed to a large extent in the Midwest. I would say that at the present time your Big 10 universities are training more people at the graduate level in this field than any other group of schools.

In general, this is a field which has been later developing in the

East than in the Midwest and Far West.

Mr. Quie. You have no doubt but what schools in cities would make use of speech pathologists, provide for their salaries, if they

were trained and ready?

Mr. Matthews. I have no question about that. I have on my desk almost constantly, I would say today I have requests, I am conservative now, 50 different schools, colleges, community chest clinics, hospital clinics, and so on, writing in asking for personnel in this field and quoting salaries which are quite competitive.

We just don't have the people to supply.

Mr. Quie. In the first part of this Resolution 494 it says:

Whereas each State cannot and should not undertake a wasteful duplication of facilities and faculties for the training of speech pathologists and audiologists. Now, therefore, be it—

and so on, with the great need of 20,000—where you only have 2,000 do you think there would be any duplication of facilities of the States?

Do you not think we need every bit of the facilities that now exist and perhaps even need to expand more for training speech patholo-

Mr. Matthews. It is possible. However, the expenditure to set up

a really topflight training program can be pretty terrific.

For example, from your own State, the University of Minnesota has a very long and distinguished record in this field. Brinkleson was one of the first people in this country to establish a training program at Minnesota. There may be a couple other institutions throughout the State of Minnesota that would have either the interest or the total university facilities to go into the training in this particular area.

I would hate, for example, to see a dozen different schools in Minne-

sota go into this on a kind of halfhearted basis.

If I may illustrate what I think is bad, what I would not like to see happen, is what has happened, unfortunately, in a few instances growing out of last year's legislation in the area of mental retardation.

I think that was a bill that was passed to support the training of people for mental retardation, but unfortunately there were no safeguards in that bill to see to it that the people who were studying in this area went to school that had honest to goodness worthwhile programs.

So, as a result, in some places in the country individuals have selected schools to receive training in the area of mental retardation and they have selected schools which just were not ready to train

Mr. Quie. You think the safeguards are in 494?

Mr. Matthews. I think Congressman Elliott's bill has some very fine safeguards, inasmuch as it is written specifically in here that no school may receive grants in this particular area unless they have a training program which is approved by the national accrediting group.

I think that is a very fine idea.

Mr. Quie. I think that is a good suggestion, that you bring up, because we did a study for 2 years in Minnesota and came to that conclusion, that rather than let State colleges get into this program of training the teachers for the handicapped, it ought to be centered in the University of Minnesota because you get a much better program that way.

Mr. Daniels. Thank you very much, Mr. Matthews. If you have a prepared statement you desire to file, that statement will follow your

oral testimony.

(The prepared statement follows:)

STATEMENT BY DR. JACK MATTHEWS, DR. HENRY GOEHL, AND DR. FRED KRAUSE RE SERVICES FOR SPEECH HANDICAPPED CHILDREN IN WESTERN PENNSYLVANIA

PREVALENCE OF SPEECH PROBLEMS

Our committee has surveyed the prevalence of speech problems in the schoolage population of Allegheny, Clarion, Green, Armstrong, Beaver, Washington, Westmoreland, Fayette, Lawrence, and Butler Counties. Our survey is based on data supplied by school officials as well as directors of speech clinics in hospitals, universities, and other agencies supplying speech correction services in the 10 counties. The survey shows that approximately 29,000 school-age children in these counties have been identified as having speech problems serious enough to interfere with their educational, social, and emotional adjustment. These data for western Pennsylvania are in essential agreement with prevalence data reported recently by the U.S. Office of Education. For a moment let us focus on the national scene.

Within the total population of handicapped children in the United States the largest group consists of children with speech and hearing disorders. More than one and a half million of our boys and girls have speech or hearing that is so seriously impaired that it can and frequently does interfere with their educational, social, and emotional adjustment. The most recent report issued by the U.S. Office of Education ¹ estimates that 4 percent of our 40 million school-age population (5 to 17 years, inclusive) have severe speech and hearing handicaps.

If we take a typical city of 40,000 we would estimate the school-age (5 to 17 years, inclusive) population to be approximately 10,000. Table 1 (an adaptation of table 1 of the Johnson report cited above 1) presents the estimated number of these 10,000 school-age children with each type of speech and hearing impairment. Table 1 also contains estimates of the total number of school-age children in the country with each type of speech and hearing problem.

Table 1.—Estimated number per 10,000, number in entire country, and percent of school-age children with each type of speech and hearing impairment

Type of impairment	Number per 10,000 children	Number among 40,000,000 American children	Percent of children
Articulation problems Voice problems Fluency and rate problems Stuttering Hearing problems of communicative and educations signifi-	10 5 70	1,000,000 40,000 20,000 280,000	2. 5 . 1 . 05 . 7
eance. Speech problems associated with cleft palate and lip Retarded speech development. Speech problems associated with cerebral palsy and other types of neuromuscular impairment.	50 5 5	200,000 20,000 20,000 20,000	.5 .05 .05
Total	400	1,600,000	4.00

The estimates presented in table 1 are conservative and in each instance err on the side of underestimating the number of speech and hearing handicapped children. These estimates were based on Johnson's examination and evaluation of numerous surveys of the prevelance of impaired speech and hearing in children.

CRITIQUE OF EXISTING SERVICES FOR SPEECH HANDICAPPED CHILDREN

Returning to our 10-county area let us see what we are doing to help the 29,000 speech handicapped school-age children. Our study indicates that the 29,000 children are being treated by a staff of approximately 113. This means each speech clinician on the average is treating 256 children. This is three times the caseload recommended by experts in the field of speech correction.

The picture is even more distressing when we examine the qualifications of the individuals carrying on speech correction activities in the 10 counties. Only 20 of the 113 clinicians are certified by the American Speech and Hearing Association, the national professional organization in the field of speech correction. This means that 80 percent of the personnel working with our speech handicapped children in western Pennsylvania are not certified by the national professional organization of speech correctionists.

Additional weaknesses were uncovered in the area of early detection of speech problems. In the preschool population virtually nothing is being done to discover speech problems prior to entrance into school. Thorough diagnostic examinations are almost unavailable for most speech handicapped children in com-

Johnson, Wendell, "Children With Speech and Hearing Impairment." Bulletin, 1959, No. 5, Office of Education, U.S. Department of Health, Education, and Welfare.

⁴⁸¹⁵⁷⁻⁻⁻⁶⁰⁻⁻⁻pt, 4-----4

munities outside the Greater Pittsburgh area. Few of the 113 public school speech clinicians are trained sufficiently to carry out adequate speech diagnosis of the severely speech handicapped child. In this regard speech handicapped children in Pittsburgh and Allegheny County have an advantage over children in most of the other counties because of the larger number of well trained speech clinicians avialable in the school systems as well as in other agencies in the Greater Pittsburgh area.

Another great deficit in speech correction services is in classes for the mentally retarded and for the cerebral palsied. Approximately two-thirds of these children have speech problems, but only a small minority are receiving speech

correction services.

CAUSES OF PROGRAM INADEQUACY

An important cause of the present lack of an adequate program for speech handicapped children is the shortage of trained speech clinicians. The shortage exists throughout the country. For the country as a whole a minimum of 20,000 speech and hearing clinicians are needed to meet the needs of our total speech and hearing handicapped population. At the moment we have available 2,000 certified and 5,000 noncertified personnel in this field.

In Pennsylvania the program is further hampered by regulations for State reimbursement which tend to encourage excessively large caseloads. Local districts seem to be tempted to present evidence of large numbers of speech-handicapped children being seen by speech clinicians in order to secure maximum.

mum reimbursement from State funds.

The present department of public instruction requirements for certification of public school speech therapists discourage many well-trained speech correctionists from going into public school speech correction and at the same time make it possible for individuals with a low level of qualifications in speech correction to obtain certification if they can present the certification requirements for classroom teaching. Pennsylvania certification requires the public school speech correctionist to be first a teacher and secondly to have a smattering of courses and training in speech correction. This is in direct contrast with certification procedures adopted by the city of Chicago with stresses training and competence in the field of speech correction with a minimum of required courses in general teacher preparation areas.

RECOMMENDATIONS

In view of the weaknesses revealed by our study we recommend:

1. The Governor be urged to ask all Pennsylvania Congressmen and Senators to lend their support to Senate Joint Resolution 127 (introduced by Senator Hill and others) and its companion resolution, House Joint Resolution 448 (introduced by Congressman Fogarty and others). This legislation would make funds available from the Department of Health, Education, and Welfare for the training of personnel in the speech and hearing field.

Steps to be taken to encourage the department of public instruction to redefine requirements for certification of speech correctionists, to place greater emphasis on competence in speech correction and less on competences as a class-

room teacher.

Regulations for State reimbursement to local school districts be drawn up in such a manner as to discourage the carrying of excessively large caseloads.

Mr. Daniels. At this time I call James A. Kimple, superintendent of schools, Fair Lawn, N.J.

STATEMENT OF JAMES A. KIMPLE, SUPERINTENDENT OF SCHOOLS, FAIR LAWN PUBLIC SCHOOLS, FAIR LAWN, N.J.

Mr. Kimple. Mr. Chairman, members of the committee, I sincerely appreciate the opportunity of appearing before you this morning and since the committee has received much more expert testimony regarding the diagnosis and treatment of children needing special education than mine could ever be, and is completely aware of the magnitude of the problem, I shall confine my remarks to the community of Fair

Lawn and to our needs in special education and mental health as I see them.

Fair Lawn, as has many another community, has expanded rapidly during the past 15 years. With 7,700 children in school, we have now

5 times as many as we had in 1940.

During this time, as facilities and personnel have been added to accommodate increased enrollments we have not forgotten the physically and mentally handicapped nor the emotionally disturbed.

Ten years ago we employed our first school psychologists. Today

we have six and are understaffed.

In 1950 we established the first special class for emotionally dis-

turbed children.

Parenthetically, we shall never do this again. Today we have 4 classes for mentally retarded children with 32 of our own children and 17 who come from other districts.

We send four blind, six cerebral palsy, and two deaf children to

other school districts.

We have 10 other children who are either institutionalized or would

attend at private schools.

We also have two children currently at home with severe mental retardation who are receiving no training and two who receive home

instruction on a regular basis.

I think this next statement is probably the most significant of all. Hence, out of 7,700 public school children, we have only 58 who we feel cannot receive adequate education through our regular school program when this is adjusted to the needs of each individual.

We obviously want as many of our children as possible, regardless of handicap, to be educated in our own community and to derive the

benefits of close association with other children.

In my opinion, provision for the education of the handicapped is primarily a local responsibility. Since solutions to the problems of the handicapped depend to a very great extent on the attitudes of all people toward them, and this includes the emotionally disturbed, the handicapped person needs to be accepted by the nonhandicapped as human beings and as productive members of society.

Proper attitudes toward and complete acceptance of the handicapped can only be developed by close day-by-day association. That

association is possible only within a local community.

This is why our classes for mentally retarded, both trainable and educable, are located in regular school buildings. The effects of this close association among the children, parents of normal and handicapped children, as well as teachers, have produced acceptance and understanding of mentally retarded that I would not have thought possible when we first established the classes.

This close association has had salutary effects on the attitude of

education of normal children.

Our problem in Fair Lawn is primarily an economic one. We in conjunction with neighboring school districts need funds to help us do more than we are now able to do.

Parenthetically, next year we have budgeted for a class for blind retarded children within the school district and I think that this will be the first class of such a nature in the State of New Jersey.

In addition, we need a sheltered workshop for mentally retarded, a mental health clinic or an all-purpose clinic; facilities for special

classes in the immediate vicinity for cerebral palsy children, blind, cardiac, deaf; additional psychological services to help in the schools to do preventative work; additional speech therapists.

With these facilities and personnel we could go a long way toward

the solution of our most pressing problems.

I should like to suggest that consideration be given to the provision of funds to local communities, either singly or in concert with each other, to do several things:

No. 1, to amortize the cost of classroom facilities and equipment, to help defray the expenses of local mental health or all-purpose clinics. and to provide for additional psychologists and speech therapists.

I would also like to suggest that these funds be made available to

local communities on the basis of X number of dollars per pupil.

Mr. Daniels. Thank you, Mr. Kimple.

Mr. Kimple. I might add, if I may, when we talk about the State of New Jersey, the State of New Jersey does provide a certain amount of assistance to local districts. For the mentally retarded classes we receive \$2,000 per class from the State.

We also, as the gentleman from Jersey City has said, receive trans-

portation assistance, but this is the size of it from the State.

I might also say here that as far as the State of New Jersey is concerned, it is not carrying its full load for the education of all children. In Fair Lawn, for example, we receive about 13 percent of our total annual budget for educational purposes from the State sources.

Twenty-four percent comes from local tax on industry and the

remainder from local property taxes.

It actually is quite a burden upon the local districts.

Mr. Daniels. You mean real estate? Mr. Kemple. Yes.

Mr. Daniels. That is bearing the major burden? Mr. Kemple. Yes.

Mr. Daniels. Thank you.

Mr. Quie. By annual cost of education, do you mean current expenses or the capital outlay as well?

Mr. Kemple. This is total expense. From the State we receive 13

percent of our total budget.

Of course, from the Federal Government we receive certain amounts, but this actually does not amount to anything that is significant.

Mr. Quie. That \$2,000 per class for mentally retarded is a class

grant? Mr. Kemple. Yes.

Mr. Quie. Is it the same amount for other handicapped classes?

Mr. Kemple. I think so, but I am not quite certain of this.

Mr. Quie. Thank you very much.

Mr. Kemple. Thank you, Mr. Chairman.

Mr. Daniels. I will now call Martin Mason as our next witness.

STATEMENT OF MARTIN MASON, BERGEN COUNTY CEREBRAL PALSY LEAGUE, INC.

Mr. Mason. Thank you, Mr. Chairman.

Mr. Chairman and members of the committee, I appear here today representing the Bergen County Cerebral Palsy League, an organization of parents and friends of the cerebral palsied, founded in 1948 and dedicated to the welfare and rehabilitation of the cerebral palsied and those with allied handicaps.

I have served the League since its start.

In speaking for the cerebral palsied, one must necessarily consider the blind, the deaf, and the mentally retarded, for all of these condi-

tions may also be present in the cerebral palsied.

This statement will bear on the bill for independent living, H.R. 3465, on Joint Resolution 494, to provide teachers, speech pathologists and audiologists for those handicapped by deafness; on education, housing, and institutional care for the handicapped; on a census of the handicapped, and on tax relief for the handicapped and their families.

On the bill for independent living:

1. There are in Bergen County not fewer than 118—based on a tabulation prepared by the rehabilitation department of the Bergen County Tuberculosis and Health Association (see appendix 1) cerebral palsied individuals under the age of 16 for whom some, or all of the services proposed to be provided under this bill may be necessary.

2. There are in Bergen County not fewer than 800—based on a tabulation of children receiving service at Cerebral Palsy Center, Bergen County (see appendix II) cerebral palsied individuals under the age of 18, for whom some or all of the services proposed to be provided under this bill may become necessary as they reach employable age.

3. We, as parents and friends of the cerebral palsied, believe that the proposed bill will accomplish much for these handicapped. are particularly interested on the provisions of title III, workshops and rehabilitation facilities, covering the establishment of nonprofit

workshops for the severely handicapped.

On the joint resolution for help for individuals handicapped by deafness, we favor the passage of Joint Resolution 494, which will make available to children handicapped by deafness, including our cerebral palsied children so handicapped, the services of more specially trained teachers.

On education for the physically handicapped, Bergen County is a suburban area covering some 233 square miles. Within this area there are 70 municipalities with a population which has grown from 539,000

in 1950, to an estimated 800,000 today.

Some communities have provided special classes for the physically handicapped in accordance with the provisions of the Beadleston Act and will accept children from adjacent towns. These classes, held in plant suitable to the needs of the handicapped child and located in the near vicinity of the child's home represent the happiest solution of this problem.

There are, however, a number of towns which because of plant or other limitations, do not provide such classes, but avail themselves

of facilities located out of the county.

One such facility which has accepted children from Bergen County

is the A. Harry Moore School, in Jersey City.

Each local Bergen County board sending a child to the school pays for the transportation of the child to the school and for tuition at the school.

A recent survey indicates that not fewer than 53 are now being sent to the A. Harry Moore school. The cost of transporting these children exceeds the cost of educating them; the wear and tear on the child is not inconsiderable.

We in Bergen County are grateful for the facilities provided by the A. Harry Moore school and hope that our children may continue to

take advantage of them for as long as they may be available.

However, it would seem that a regional school located in Bergen County and specially planned to provide education to the handicapped is necessary for those who are physically and mentally within acceptable limits, but who are not included in any school program presently operating within the county.

The construction and administration of such a school would, however, require a community effort between the county and its 70 towns, and the support of the several public and private agencies working

with and for the handicapped and in the field of education.

It does not fall within the responsibility of any single group or agency within the county or State to make the surveys required and to bring together all the components involved for a resolution of the problem.

The situation outlined above is certainly not singular to Bergen County. A solution to our particular problem would provide an-

swers to similar problems throughout the United States.

It is therefore suggested that the Department of Health, Education, and Welfare, first, institute an investigation to determine what might be done to assist such localities in establishing proper facilities.

Second, institute a program of public education as to what Federal

and State aid is available for such purposes.

On housing for the handicapped, we believe that no program of rehabilitation for independent living for the mentally regarded and severely physically handicapped can accomplish its purpose completely, without the provision of housing constructed or adapted to the needs of the handicapped.

It is suggested that the Department of Health, Education, and Welfare might institute a program of research to determine what may

be done to provide such housing.

On separate institutional facilities for the mentally normal physically handicapped, there will undoubtedly be those for whom rehabilitation to the point of independent living will not be possible because of the extent of their physical incapacity.

We believe that institutional facilities for such individuals should be physically separate from those provided for the mentally retarded

and for the aged.

On a census of the severely handicapped, in the development of any program for the handicapped it soon becomes apparent that no one knows within any reasonable degree of accuracy how many individuals will benefit from the program under consideration. Most programs under development are based on guesses, which are based on projections, which may be based on the number of individuals found to have a certain disability during the course of a basic research project. This is not a reflection on the value of any project, nor the factuality of the figures developed in connection therewith as they apply to that project.

However, there is reason to doubt that individuals selected for study represent a true cross section of the total number similarly

handicapped.

Consequently, any projection of such figures may be seriously in error. It is suggested that, in keeping with our increasing concern for the handicapped, we count and catalog them so that we can better

serve our society.

On tax relief for the handicapped, it has occurred to us that families charged with the responsibility for the care of a physically handicapped or mentally retarded child are under far heavier financial burdens than are those with normal children. In all equity it would appear reasonable that such families be granted an additional exemption which, together with the customary medical expense deduction, would to some degree compensate for and lighten that burden.

Further, it is suggested that individuals who are entitled to aid under H.R. 3465 and/or their families should receive like consid-

eration.

It is suggested that such exemption be continued for as long as the family responsibility continues, or as long as the individual requires

any of the services provided under H.R. 3465.

In connection with tax relief, it is suggested that the granting of the exemption be based on a doctor's certificate describing in brief the nature and extent of the disability. This information could then be turned over to the Department of Health, Education, and Welfare for dissemination to its agencies and affiliates.

In this way it is probable that all individuals entitled to such deduction would make application therefor, that the heavy expense of a separate census would be eliminated and that we would have the factual information on which our programs must be based.

Thank you for your courtesy and attention, and for your concern

with our problems.

(The appendixes I and II, referred to, follow:)

APPENDIX I

There are in Bergen County not fewer than 165 cerebral palsied individuals over the age of 16 known to the rehabilitation service of the Bergen County Tuberculosis and Health Association.

Of this number 118 may require the further service offered by H.R. 3465, independent living bill. These individuals are presently disposed as follows:

	2
Attending private schools	2
Attending special classes in public schools	
Attending A. Harry Moore School in Jersey City	4
Receiving home instruction	1
Attending the Easter Seal craft unit, Hackensack	15
Having no program at present	15
Too handicapped for services presently available	32
Looking for work (the severity of their handicap makes their employ-	
ment problematical)	11
In institutions	22
Of the balance 47 are situated at the present time, as follows:	
In secondary school	23
In college	7
	2
Have home businesses	
Employed at Associated Craftsman (Sheltered Workshop)	5
34-0-1-1

Mr. Daniels. Mrs. Marion C. Reed, president, Consumers League of New Jersey, Newark, N.J.

930

If you have a prepared statement, you may give a summary of it verbally. Following your verbal statement you may file your written statement for the record.

However, if you wish to read your statement you are at liberty to do so.

Inasmuch as we are running behind schedule, I must caution you, as I have the previous witnesses, to limit your time to a period of not more than 10 minutes.

STATEMENT OF MRS. MARION C. REED, WESTFIELD, N.J., PRESIDENT, CONSUMERS LEAGUE OF NEW JERSEY

Mrs. Reed. Thank you. I will try to make it as briefly as possible. I will submit the statement and then give some oral testimony. (The statement referred to follows:)

STATEMENT OF MRS. MARION C. REED, CONSUMERS LEAGUE OF NEW JERSEY

My name is Mrs. Marion C. Reed. I live at 918 Boulevard, Westfield, N.J. I am president of the Consumers League of New Jersey.

This organization actively promotes fair labor standards, through investigation, education, and legislation.

ADDITIONAL FUNDS NEEDED

The New Jersey Rehabilitation Commission is making every effort to serve those disabled people who can be vocationally rehabilitated. More money is needed to care for all who require help. Five out of six handicapped persons must wait because the staff is too small to serve them. Each year of neglect makes the rehabilitation more difficult.

SOME THINGS CAN'T WAIT

Public health figures show that 7,810 persons in New Jersey become disabled each year. This past year 1,316 were rehabilitated. The current backlog is estimated to be 62,000. The staff is working to capacity.

Those rehabilitated last year will earn about \$3 million annually. This means increased purchasing power, plus a substantial tax contribution. It is stated by the rehabilitation commission that for every dollar spent on rehabilitation services, \$10 returns in taxes.

Experience proves that handicapped workers can learn to be dependable, safe, capable workers. Their "job" performance is even more satisfactory than that of the average worker who is not handicapped.

Without this chance, they may become hopeless, helpless financial burdens to the State or to their relatives. With this opportunity they can become a useful part of our productive economy.

This is not a plea for handouts. This is a plea for more funds to help those who want to work and enjoy a normal life.

H.R. 3465 SUPPORTED

We believe that the rehabilitation commission should service the disabled who can be improved to the point of self-care. The ability to take care of themselves would release needed hospital beds. It would ease the strain in many homes and in some cases would release a bread winner for work who, at this time, constantly attends the invalid.

The hope engendered in these forgotten men and women, by being able to take care of themselves, will propel many of them into part or full time employment.

HOUSE JOINT RESOLUTION 494 SUPPORTED

There is in New Jersey, as in other States, a shortage of trained speech pathologists and audiologists. This shortage can be partly overcome by making funds available to institutions qualified to give such straining. The School for the Deaf in Trenton and the Day School in Newark, N.J., has a waiting list of children needing special schooling.

There is need for expansion facilities in these schools but there is a greater need for teachers. The best results are obtained by starting training early, but

many children must wait.

One out of five children in the school systems of New Jersey has a speech defect. One out of about thirty-three children has a hearing defect and half of these children are permanently disabled.

One out of every ten of New Jersey's population has a speech problem. One out of every twenty has a hearing problem. It is estimated that 5 percent of adults over 15 years of age have hearing loss.

It is estimated that New Jersey has 2,500 aphasiacs (loss of the power to use

or understand speech).

A research study of industrial deafness in New Jersey would be helpful in order to determine the extent of loss of hearing, caused by working conditions, and the preventive measures that are desirable.

Many having hearing disabilities have been serviced by the Rehabilitation Commission of New Jersey. In 1959 there were 140 accepted for service and

88 rehabilitated. Three case histories are:

CASE NO. 1

This 25-year-old single woman was referred by the New Jersey School for the Deaf. Although she had congenital deafness, she was capable of lipreading and use of sign language.

After a complete diagnostic workup, it was found that she was capable of undertaking college training and the commission spousored a 5-year course, with a major in home economics at Gallaudet College for the Deaf. She graduated

with high honors and made the "Who's Who."

The commission provided her with tuition, books and supplies, and partial maintenance. During the summer months she worked for a shirt company as a buttonhole operator, which gave her practical experience for teaching home economics, which was her vocational goal. Her earnings also supplemented the maintenance provided by the commission.

This case is particularly interesting in that she was finally placed at the New Jersey School for the Deaf in Trenton, which had originally referred her to the

New Jersey Rehabilitation Commission. Total cost to the commission, \$3,473.

This woman, who is now suitably employed, is also helping others with disabilities such as her own.

CASE NO. 2

Salesman rehabilitated

Charles R., age 59, was referred to the rehabilitation commission in April 1959. He had a diabetic condition, which was under control, and a serious loss of hearing acuity. Charles was self-employed as a salesman, dispensing household products door to door. His wife and 9-year-old daughter were dependent upon his income.

Since 1953 he has gradually experienced a loss-of-hearing acuity but was never financially able to purchase a hearing aid. During the past 2 years he experienced marked difficulty in maintaining a conversation. It became a frequent occurrence for him to request a repetition of phrases at home and with the public. In order not to appear disabled and foolish he pretended many times to hear. However, this proved frustrating in his work, as well as embarrassing and, as a result, he began to exhibit a serious degree of nervousness and insecurity. His approach to the public and his attitude toward work had begun

a subtle change which threatened to affect his business.

An otiatric and audiometric evaluation arranged by his rehabilitation counselor disclosed the need for a hearing aid. His disability was diagnosed as bilateral impaired hearing, nerve degeneration, middle-ear disease, quiescent. With a hearing instrument, there was every possibility of resorting hearing acuity so that in the conduct of his business, the hearing difficulty now present could be removed. Provision was subsequently made for a suitable hearing aid and within a week after he had received this appliance he had learned to use the instrument with great success. He was able to enter into his work with greater self-confidence than before and sell to the public with increased effectiveness. Thus, not only was his job and income maintained, but his attitude, approach to the public, confidence in the future of his business, and ability to provide for his family was fully restored.

CASE NO. 3

This 39-year-old deaf man, married, with three children aged 15, 11, and 9, was referred by a municipal welfare department. At the time of referral he was suffering from anxiety which stemmed from his disability and had experienced friction at home and on the job. Because he was a poor manager, he had gotten into debt and a lien had been placed on his salary, which caused trouble

and disfavor with his employer, which ultimately caused loss of his job as maintenance man. He had moved from one town to another and his relief checks had been cut off by the former town because of some difficulties he had had with The referring welfare municipality, even though he had not acquired

residency in their town, had undertaken maintenance of his family.

After general medical examination and a complete hearing evaluation, it was determined that the man could benefit by a hearing aid. This was provided and, after aptitude testing, it was decided that he was best suited for he kind of work that he had been doing. Through counseling and guidance this man gained enough confidence to apply for a job as a maintenance man with a board of education. As result of intercession of welfare worker and commission counselor, the client was hired.

The client, at present, is suitably and successfully employed as a maintenance man at a salary of \$250 a month, with which he is able to support his family. The emotional problems in a job situation and at home, which frequently accompanied the hearing loss, have been alleviated through the provision of the hear-

ing aid and counseling and guidance.

This is a good illustration of agency cooperative relationships.

Cost to the commission, \$195.65.

This client had been receiving \$198 monthly from municipal welfare. He has now been taken off the relief rolls.

We urge that H.R. 3465 and House Joint Resolution 494 be inacted to provide

money to increase the extent of this important work.

Mrs. Reed. We believe that the Rehabilitation Commission of New Jersey has demonstrated the value of training those people who can be trained to be good workers. We are very loathe to say that we don't believe that they have covered all the people who should be covered, but it is because they haven't had the money to do it.

We hope that there will be more money for rehabilitating those people who can be employed. We support H.R. 3465, the independent living bill, because we believe that this is an area in which help should be given to make these people capable of taking care of themselves.

We also support the House Joint Resolution 494 because we know that there is a definite shortage of these specialized teachers in New

Jersey.

The training school in Trenton, N.J., has a waiting list because they haven't enough qualified teachers. The day school in Newark also has a waiting list.

Some of this would mean expansion of facilities, but the greatest

need is for trained teachers that are just not available.

We think that this resolution would help in that area.

I would like to speak also of the area of migrants which require special education. The migrant travels from State to State, as you know, and I believe it is an area in which Federal aid is needed to help out the State.

We have had three demonstration schools here in the summer for the children of migrant labor and have found that they have been very beneficial for those migrant children that could attend, but it only scratches the surface. There are many of them that cannot attend the schools.

The schools that we have had demonstrate the need for more summer schools for migrant children. Many of them are very far behind.

Some of them have not attended school at all.

I think most of them are at least 2 years behind the grade that other school children would have.

Mr. Daniels. Do you think that the migrant would send his children to school if more schools were available?

Mrs. Reed. I am sure they would. They are very anxious for their children to have the opportunity that they have not had because they know that unskilled labor is drying up, that there is not going to be as much of it in the future as there is now and they are not educated well enough to go out and get work at other places.

They would like to have their children be able to get out of this

stream that they are in.

Mr. Daniels. I take it from your testimony the reason why they are not going to school is because there are not sufficient school facil-

ities available at the present time.

Mrs. Reed. Partly that. There are not enough summer schools available. These children move from one place to the other. It is very hard if you are in one place for 6 weeks to fit into a regular school system and get something out of it before you move on to the next.

It is understandable that some school districts are not putting forth a great deal of effort to get these children into the regular school because it means additional teachers; it means expanding the school system for a short period which is financially impossible for some of

the districts.

I also would like to bring up the problem of the education for the migrant, himself, or herself. They have not received the education that most of the people in our country have received and they are thirsty for knowledge. They would like to have knowledge. I think that money could be used to use some of the facilities that we already have set up, for instance, the agricultural extension system, if there were someone there to go out to these migrants and help them for planning meals and how to take care of the house and a lot of things.

One migrant woman I spoke to and asked if she would like to have

any kind of adult education, she said, "Oh, yes, I would."

I asked "What would you like?"

She said, "Anything." We just don't know anything. Just teach us anything. We would be so glad to know, anything that you could have us taught."

So I think there is a great need there. I think it could be done through the extension service. It could be done through the nutri-

tion staff of the department of health.

I am suggesting these established agencies because I think if they are established it is always more economical to use them than it is to set up a completely new service for these people.

Mr. Daniels. Does that complete your testimony?

Mrs. Reed. Yes.

Mr. Daniels. Do you have a prepared statement?

Mrs. Reed. Yes, I had a prepared statement.

Mr. Daniels. You may leave it with the reporter and it will be placed in the record.

Mrs. Reed. Thank you.

Mr. Daniels, I would like at this time to call on Mr. Herman Ehrlich, of the State of New Jersey.

Dr. Barnard. I would like to request, on the part of Mr. Ehrlich, that his statement be made an official part of the record at this point. Mr. Daniels. Without objection, the statement of Mr. Ehrlich will

form a part of the record.

(The statement referred to follows:)

Passaic, N.J., February 18, 1960.

The Subcommittee on Special Education, Committee on Education and Labor, U.S. House of Representatives.

Gentlemen: I wish to express my most sincere appreciation for allowing me

this opportunity to submit this report on behalf of the shut-ins.

I would like to explain the word "shut-ins" in the way I propose to use it in this report, I mean those people who are physically handicapped so that they find themselves unable to get out of their homes without help, but who with the help of door-to-door transportation and a place to meet with other similarly afflicted people to have a little recreational and social life, instead of just having to sit in their homes and watching that marvelous instrument, the television, or reading a book or newspaper, or doing some hobby or just having to look into space waiting that the day should pass.

I have a plan or the way I would like to call it, an idea, for a series of these places, or the way I would like to refer to them hereafter in this report, as a series of clubs that should be set up in almost every community in the United States where the people, which I have described above, could be brought or come there every so often, as often as possible, to pursue their hobby at their own pace, among people who will be willing to understand their problem and where there will be all kinds of help available, if they want it, to become a little more self-sustaining and to be able to take care of themselves a little better then they could do before.

These clubs would have to be staffed with competent personnel with funds provided by the Federal Government, and by the State governments and by local charitable groups as well as the members themselves through dues and other ways that could be worked out.

I am going to submit a more detailed statement regarding my plan for the above-described series of clubs as well as a letter from a former executive director of the Jewish Social Service Agency of Passaic, Clifton, and vicinity for 11 years in which he refers to the urgent need for a series of clubs as I have described above.

And now I would like to add a few words about the very important and necessary problem of providing the means by which handicapped persons can have the possibility of buying hospitalization-medical-surgical insurance, due to the very high cost of being ill today. It seems that the private insurance companies say that they cannot give us the necessary insurance because of the standards set for these policies. Therefore I think that here is an important field where the Federal Government could and should move successfully through the social security system of deductions.

Finally, I would like to say a few words about those of us receiving social security benefits from our parents' benefits. As you know I am one of these persons and I have been wondering for a long time, as to what happens when our parents are no longer here to help us out with what little financial aid they can. For example, I am receiving \$46 a month and I would appreciate it very much if you would tell me how am I going to live then. Therefore, I think that the Congress should look into this matter as soon as possible.

Hoping that you will be able to print these remarks and the accompanying

material in full in the report of this hearing, I remain. Very truly yours,

HERMAN EHRLICH.

MY PLAN

I have a plan for a series of clubs for the physically handicapped who are homebound but are able to get out with help to attend meetings and to work on their hobbies as a help as occupational therapy and maybe a little physiotherapy and maybe any other activities as may be needed by the members.

The main purpose of these clubs will be to get these homebound people to also feel that they have a place where they are wanted and needed and maybe be helped some to be able to take care of themselves.

The purposes of these clubs will be both social and beneficial,

The social purposes will be-

To meet to exchange ideas.

To create better conditions for the physically handicapped.

The beneficial purposes will be-

1. To keep occupied while doing interesting hobbies.

2. To benefit from the programs of occupational therapy and physictherapy under professional guidance.

3. To try to sell some of the hobby crafts that have been produced as well as to show the type of work that has been produced by the so-called

I think that the best way the Congress could find out whether there is a need for such a series of clubs would be to use the files of such agencies as the social security offices and the rehabilitation agencies of each State.

Mr. Daniel. I will call at this time on Mr. Joel R. Jacobsen, executive vice president and legislative director, New Jersey State Council.

Mr. Jacobsen, I welcome you here. I have noticed you have been out of the room for some time. I would like to say to you, as I have to the previous witnesses, that if you have a prepared statement and desire to summarize the views contained in that statement, you may do so, and that I must limit your testimony to a period not exceeding 10 minutes.

STATEMENT OF JOEL R. JACOBSEN, EXECUTIVE VICE PRESIDENT AND LEGISLATIVE DIRECTOR, NEW JERSEY STATE COUNCIL, NEWARK, N.J.

Mr. Jacobsen. Thank you very much. We appreciate very much this opportunity to present the views of the CIO. I recognize fully that 10 minutes is impossible to delineate our total reaction to the

I would, therefore, like to confine myself to our general reaction with just one or two specifics which we would like to discuss in some

First, the State CIO Council is in complete sympathy with the entire program. We support the independent living program, but we would commend to your attention a reservation which has been expressed by the National Federation of the Blind. This reservation appears to have considerable merit. We would call to your attention this particular reservation.

Secondly, we support the objectives of the Resolution 494. To be specific, however, I would like to concern myself with the status of the rehabilitation work in New Jersey and to indicate to the committee that as a government agency we could not ask for a more intelligent or a more responsive service than our present New Jersey Re-

habilitation Commission.

The philosophy of that commission, the leadership of the commission, the personnel of the commission, in our opinion, could very well

serve as a model throughout the Nation.

I emphasize that point because whatever deficiencies exist, they do not exist because of the philosophy of the leadership or the personnel, but there are deficiencies and these can be traced to the very vital phrase, "Lack of funds."

I know there will be presented to you later some statistics indicating the nature of the specific lack of funds and how it has adversely

affected the work of the State.

It is an unfortunate situation in our State that we have a Government agency with the heart and mind to perform a vital function, but it cannot succeed in assuming its total responsibility because there are not enough working bodies in which to place this heart and mind.

We would call attention to the fact that the present statute works as a ceiling to restrict the State appropriations for rehabilitation and we urge your consideration of this point.

Mr. Daniels. You say the present statute. Is that the State

statute?

Mr. Jacobsen. The Federal statute.

Mr. Daniels. In what area?

Mr. Jacobsen. The formula works to restrict the appropriations from the State. It acts as a ceiling for the high income States.

We are further specifically concerned with the problem of the aging. If I can insert a personal parenthetical note, the way I feel this morning, this is not an academic subject in which I feel myself interested, but as medical science demonstrates increasing knowledge and progress obviously people live longer and as they live longer their problems are compounded and rehabilitation of the aged is a most vital subject.

In New Jersey 3 years ago the New Jersey Old-Age Study Commission published a report in which they set forth several items that might be worth repetition here. They stated for the general objective of shifting the emphasis on programs for the aging from custodial care in institutions to rehabilitation and return to community life, they quote the 1955 report to the Governor's Conference of the Coun-

cil of State Governors as follows:

In the past a high proportion of persons with disabling chronic illness and handicaps have been relegated to custodial care in nursing homes, county homes, in homes for the aged, in their own families and even in general hospitals and chronic hospitals. It is now recognized that special provision must be made for those who can be rehabilitated.

This continues:

The objectives of geriatric rehabilitation includes restoration of the physically disabled patients to the highest possible degree of physical, psychological, and social efficiency, reintegration of the older person in the families and in the social groups in the community, and vocational retraining to enable him to return to employment.

We would commend to your attention this particular phrase.

I would like to emphasize and agree wholeheartedly with the statement entered by Mrs. Reed with regard to the education of the migrant. We have had a peculiar situation in the State where in the year 1959 we achieved a great social goal of making sure that the migrants had hot water which was certainly an achievement in this day and age.

I might add parenthetically that there has just been introduced in the State legislature a bill to repeal the hot water for the migrants.

As a symbol of the progress of the migrant it appears to us that these special education facilities are something that the committee would be very wise to consider.

We cannot understand the philosophy which keeps people in a depressed area because of lack of education and then prevents them from securing the education from which they could extricate themselves from the depressed position.

Mr. Daniels. Thank you.

Do you have a prepared statement?

Mr. Jacobsen. No, sir.

Mr. Daniels. Thank you very much for your testimony. I would like at this time to call Beatrice Holderman, director of New Jersey Rehabilitation Commission.

STATEMENT OF BEATRICE HOLDERMAN, DIRECTOR, NEW JERSEY REHABILITATION COMMISSION

Miss Holderman. Mr. Chairman and members of the committee, I appreciate the opportunity of appearing before you and can't commend too highly the work that you are doing in trying to uncover unmet needs as far as the human being is concerned, because there are a great many.

I do have a prepared statement that I would like to leave with you today, but I will try to confine this to the limited amount of time— I know you are behind schedule—and highlight some of the things

that I think we would like to touch upon in New Jersey.

I am a relatively new director of the rehabilitation commission. I have just been in this position for 6 months, but I know in this time, and I have known this before, the great progress that has been made as far as the rehabilitation, vocational rehabilitation, of people is concerned.

I know also that some of this progress would never have been possible if the Federal Government had not led the way as far as the States are concerned, talking about a national level and

about the State.

We know also, however, that there are grave unmet needs in our own legislation, and this is true all over. Vocational rehabilitation, as you know, is tied to the potential of employment. It is very difficult sometimes in our work when we see someone whom we cannot rehabilitate to employment status, to have to turn them away when you know possibly they might be helped if you could give them the kind of help that will be possible under the independent living bill.

Our board of commissioners of the rehabilitation commission wholeheartedly supports the principles embodied in this legislation.

We also support the resolution, 494, for speech and hearing, the development of speech and hearing specialist and greater training in this field.

We know that we do not have enough rehabilitation facilities in the We do not have enough sheltered workshops in many areas of the State to take care of the cerebral disabled.

This, again, means you are not able to give attention to the many

people who need this work.

We are conscious of the fact that in many of the severe disabilities such as Parkinson disease, multiple sclerosis, multiple dystrophy, cerebral palsy, and epilepsy, that greater research would make possible help to the severely disabled people.

In the field of mental retardation, we know that in our own State a lot of good work has been done. We know, too, that we have only

scratched the surface.

We do have an excellent cooperative arrangement with the Department of Education in going into the fields, but we are just beginning in this field so that we can, with our own counsellor and the guidance counsel in the school, help to plan an objective for the child so that there is not the gap when the child comes from school into the

employable or adult age.

One of the very grave needs in the State is trained specialists in the field of vocational rehabilitation, in vocational therapy, speech, and hearing therapists, and we cannot stress too highly how the Federal Government could help through grants to encourage the universities to include in their educational curriculums programs for training people who are needed if we are going to make any progress as far as helping the people who need it so badly.

Under H.R. 3465, citing several specific areas where you could illustrate the good that could be done through this bill, I am thinking of

social security and the disability insurance.

We have through the Office of Vocational Rehabilitation a referral service for vocational rehabilitation of the applicant who may be eligible for rehabilitation. We know that probably in our own State roughly an estimate of a thousand people could be served and restored to independent status if it were possible to do the things that you want to do under this bill.

We know also in our geriatrics hospitals that many of these people

could be helped.

To cite an illustration, Dr. Howard Rusk recently told a group in Princeton that they had made a study of the geriatrics hospital and of the 95 people used in this study, 90 of them should never have been

in the hospital at all.

The term that these people had been there was anywhere from 400 days to 12 and 14 years. This is a waste, a human waste, not only from the standpoint of humanity, but also as far as our economy is concerned and certainly very costly from the standpoint of investment under this program.

You might be interested in a study that we did in rehabilitation in this past year, of 107 cases that had come to us from public assistance, the individual cost for rehabilitation was about \$695 as against public

assistance cost of \$1,295 a year.

In our own State as you have heard our Commissioner and previous speakers tell you, we do not have the personnel to adequately develop the kind of program that we think is needed for the people of the State.

We have 38 counselors to service roughly 6 million people. You have 1 counselor serving a population coverage of about 145 people

when the national average is about 75,000.

I think Mr. Jacobsen spoke about the ceiling. Under the present formula, and we wonder whether possibly this might discourage instead of encourage higher income States, we wonder if possibly a further examination of this formula would be good to ascertain whether there might be not the closed end on the Office of Vocational Rehabilitation appropriation, but an open end under some conditions. We certainly do not disagree with the formula. We think it is a very good formula.

I am very happy to have been here and I want to thank you for the

opportunity to testify.

Mr. Daniels. Thank you, Miss Holderman.

Are there any questions?

(The formal statement of Miss Holderman follows:)

STATEMENT BY BEATRICE HOLDERMAN, DIRECTOR OF NEW JERSEY REHABILITATION COMMISSION

As director of the New Jersey Rehabilitation Commission, I wish to commend the committee for its work in conducting workshops and hearings in order to discover unmet needs in the field of special education and rehabilitation and to analyze the adequacy of services now available. The opportunity afforded me to testify is sincerely appreciated. Accordingly, the following testimony is respectfully submitted:

Independent living, H.R. 3465 and H.R. 1119, Rehabilitation Act of 1959

Every year in New Jersey thousands of severely disabled men and women, with insufficient means, who could benefit from rehabilitation therapies are denied such help because they cannot qualify under the present vocational rehabilitation law. The existing law requires a reasonable expectancy of employment as a condition for provision of rehabilitation therapies. Because of this requirement, countless numbers of the most seriously afflicted find themselves doomed to a condition of homebound physical dependency or are bedridden institutional cases. Passage of the independent living bill making rehabilitation available to this "lost" segment of the handicapped population, especially in older age brackets and the chronically ill, would be a means of restoring these people to independent status. It would mean, in many cases, release from expensive institutional care, and result in tax savings. In other instances, such new-found physical independence would mean freedom from attendant care at home, thus affording normal family living.

The problem is a common one throughout the Nation, accentuated by the experience of social security disability insurance program which involves vast numbers of seriously disabled people for whom no help is presently available. A substantial number of these people who cannot be vocationally rehabilitated could be rehabilitated to a staus of independent living. Professional counselors to supply the needs for the development of the independent living program will be needed.

Federal funds would materially aid in their training.

The board of the New Jersey Rehibilitation Commission has endorsed the principles embodied in the H.R. 3465.

The potential humane and economic advantages of this legislation are extremely persuasive.

Rehabilitation of the aging

In view of the fact that medical science has prolonged the lifespan, problems in rehabilitation of aging have been intensified—particularly in the areas of

medical care and employment.

Lack of understanding of this problem, together with virtually no application of rehabilitation procedures, often results in extended and expensive hospital and other custodial care. This was effectively illustrated by Dr. Howard A. Rusk in a recent address at the Institute on Psychology and Rehabilitation at Princeton, N.J. He stated that a study of 95 patients in a geriatric hospital revealed that only 7 were in need of continuing hospitalization and 2 of these were questionable, so that 90 of these patients didn't need to be in a hospital setting but were there because they had been forgotten or for social economic reasons. The average stay was a little over 400 days per patient and some had been in the hospital 12 and 14 years. This is one of the situations that might be overcome by passage of this independent living bill referred to previously.

It is an acknowledged fact that an individual over 45 years of age has difficulty in securing employment. As age alone does not necessarily reflect ability to perform effectively in competitive employment, this should be brought to the atten-

tion of employers through increased public information activities.

Restoration of section 4(a)(2) to Public Law 565 "Vocational Rehabilitation Amendments of 1954"

It was generally recognized that funds made available under this section, which expired after 3 years, had a profoundly beneficial effect upon the total program of rehabilitation.

Because there is still a lack of rehabilitation facilities in many areas of the State, it is not possible to serve all the severely disabled who could benefit by vocational rehabilitation services. Restoration of section 4(a)(2) would make

available additional grant funds and would tend to relieve this situation since private nonprofit organizations would be encouraged to develop and expand programs and facilities.

Increased grants to the U.S. Public Health Service for research in severe disability categories

There is still doubt about the vocational rehabilitation potential of disability groups such as Parkinson's dissease, multiple sclerosis, muscular dystropy, cerebral palsy, mental retardation, epilepsy and mental illness. Accordingly, it is urged that research in the above areas be encouraged in order to determine cause and remedial measures.

Scholarship aid for rehabilitation specialists, rehabilitation counselors and physical therapists

Since New Jersey has a pressing need for rehabilitation specialists, rehabilitation counselors, and physical therapists, and since training facilities for these disciplines do not exist within the State, it is recommended that the Federal Government assist in encouraging New Jersey institutions to institute these indicated programs through grants.

There is grave need for more trained people, not only in New Jersey but throughout the country, and encouragement should be given our educational

institutions for adequate training.

Government subcontracts to sheltered workshops

Although sheltered workshops have demonstrated that they can produce effectively, they often have difficulty in securing subcontract work necessary for uninterrupted operation. It is, therefore, recommended that the Federal Government allot subcontracts to facilities serving the severely disabled such as those affected with Parkinson's disease, multiple sclerosis, muscular dystrophy, cerebral palsy, mental retardation, epilepsy, and mental illness.

House Joint Resolution 494

To meet the urgent need for specially trained teachers of the deaf, speech pathologists and audiologists, passage of the above resolution is recommended.

The need is quite evident when an estimate in New Jersey indicates: 20 to 23 percent of the students have speech defects, 3 percent have a hearing problem (a survey in the schools developed this information).

Five percent of the adult population over 15 years of age has a hearing loss. Universally, 10 percent of the people have a speech problem.

Statistics

It is recommended that statistics on the national level be developed on the disability group and older workers which, when translated, will enable the States to plan and direct programs that will result in more and improved services where most needed. It is further recommended that Federal personnel assist the State agency in developing and expanding meaningful statistics, through both consultative and financial aid.

Funds

Essential to any program affecting the general welfare and economy of the State and Nation are sufficient funds for both personnel and case services so that assistance may be given to all persons in need of vocational rehabilitation. At the present time, budgetary limitations permit the New Jersey Rehabilitation Commission to employ a total of 38 counselors and 6 district supervisors. Accordingly, the population area served by each counselor is 148,000. This situation exists despite the fact tithat a recent OVR survey recommended an increase in counseling staff to 75 and district supervisory staff to 10. This would have the effect of reducing the population served by each counselor to 75,000 and would bring New Jersey's counselor-population ratio in line with that recommended by the OVR. The commission is only able to rehabilitate about one-sixth of the 7,810 persons who are disabled and will come to need vocational rehabilitation each year, with a growing backlog not being served.

The present Federal grant formula has an adverse effect on high income States such as New Jersey where it works as a ceiling rather than as a statement

to higher State appropriations.

I recommend that the formula be intensively studied with a view toward evaluation of the advisability of discontinuing the "closed end" OVR appropriation.

Mr. Daniels. At this time I would like to acknowledge the presence in the audience of two of our very distinguished citizens of the community. Sheriff William J. Flanagan. We are indeed grateful to you, Sheriff, for making the facilities of this beautiful chamber available to the congressional committee.

Sheriff Flanagan. We are very happy to have you and the com-

mittee.

Mr. Daniels. Seated alongside of Sheriff Flanagan is the Honorable Louis J. Messano, secretary of the Jersey City Board of Education.

Mr. Messano. Thank you, Mr. Congressman.

Mr. Daniels. We will adjourn at 12:30, so I think we will have

the opportunity of calling a few more witnesses.

At this time I would like to call Mrs. Betty B. Hahle, president, National Organization for Mentally Ill Children, south Jersey chapter, Riverton, N.J.

STATEMENT OF DR. IVA MINTZ, CHAIRMAN OF THE BOARD OF DIRECTORS, SOUTH JERSEY CHAPTER, NATIONAL ORGANIZATION FOR MENTALLY ILL CHILDREN

Dr. Mintz. My name is Dr. Iva Mintz. I am the coordinator of clinical services at Glassborough State College.

I am here representing Mrs. Hahle.

My affiliation with the National Organization for Mentally III Children is that of chairman of the board of directors of the south Jersey chapter. I am here representing the three State chapters, northern New Jersey chapter, and Union County chapter.

Mr. Daniels. With the admonition that I gave to the other wit-

nesses, will you try to keep within the time limitation, sir?

Dr. Mintz. I will try to.

I am also, if I may, I was scheduled to appear tomorrow as an individual.

I have sent a letter to your subcommittee saying that I will not appear tomorrow and that my testimony will be included with the testimony of today, so the 10 minutes will be saved tomorrow.

Mr. Daniels. Fine; you may proceed.

Dr. Mintz. Attempting to outline the most urgent needs in special education and rehabilitation for mentally ill and emotionally disturbed children sharply focuses attention on the tragic plight of the largest single group among the Nation's most neglected handicapped and afflicted children.

There is virtually a total lack of special programing for these boys

and girls.

While the problems of these children has been recognized for a relatively short time, and while we still have insufficient knowledge concerning the causes and cure of mental illness, still, enough work has been done by responsible professional people to justify setting up constructive programs and expanding research.

Public support is difficult to obtain, since mental illness is neither fatal nor physically crippling, and, therefore, lacks the emotional appeal of other disabilities, and fear of stigma still makes many parents reluctant to identify themselves as parents of mentally ill children.

Dr. Lauretta Bender, has written:

We have not found that these emotionally disturbed, atypically developed schizophrenic children come from any special type or kind of home or parents. They come equally from homes of intelligent, sophisticated, economically secure parents, and from the unintelligent, naive, and underprivileged social classes. They come from concerned, cooperative, two-parent families and from grossly deviate, antisocial, abandoning parents. Some parents have grown emotionally in their efforts to meet their children's needs and are articulate about their problems, other parents have met failure with depression and psychotic breakdowns * * *.

Most public schools exclude the seriously disturbed child; private schools are costly. The effect of this frustration in finding help creates growing tension in the family, and inevitably is communicated to the troubled child.

Other children in the family are caught up in a chain reaction as they become aware of family tensions, the attitude of neighbors, and

the constant demands on their parents by the sick child.

We must provide an educational program which will help the community accept the mentally ill child as a sick child, and assume responsibility for his care.

For the child who needs a controlled environment away from home, the entire State of New Jersey has but two residential treatment

centers and the waiting lists for admission are long.

The only alternative for those who can neither find nor afford place-

ment is the State hospital, where humane care can be found.

Little can be done about returning the child to his family and community without provisions for education, vocational, and therapeutic program directed to that end.

If it is our objective to help the child to return to a more normal atmosphere, then we must accept the the necessity of keeping the residential center physically within the community and of providing

a program that will be constructive and continuing.

There is an overwhelming need for facilities to help children who have had residential care to make the transition back to neighborhood, and to stay there. Day care centers, if available, could right now remove a considerable number of children and sheltered workshops for teenage mentally ill children could help them to become accepted and useful young adults.

Seriously disturbed children once considered uneducable can be helped socially and educationally in an environment suited to their

needs.

The Forum School in Paterson, organized, and maintained by the northern New Jersey chapter, of NOMIC, since 1954, has gained a widespread reputation as a pilot school demonstrating this. This day school is currently working with 20 children from 5 to 12 years of age. They are all seriously disturbed and would, in the absence of this school, either vegetate at home or be institutionalized.

Such a school requires an extraordinarily low pupil-teacher ratio. Most essential is an atmosphere free from tension, in which a child is accepted unconditionally for what he is, and not for what we would like him to be; where deviation will be tolerated, and he will be helped

in his attempt to work out his own problem.

The program must be flexible enough to allow the teacher to take advantage of the child's interest at the moment, since academic training can be given only as he shows capability and readiness for it. We must first of all reach, then teach, the child.

Because of the importance of the teacher-child relationship, academic achievement is not the paramount requisite for teachers in such a school. Stability, affection, warmth, and, above all, sincerity, these

are musts for teachers of mentally ill children.

Progress is slow and irregular, yet at the Forum School it is encouraging. A small percentage of children have even been able to return

to the public schools in their own communities and to do well.

In theory we recognize the right of every child to an education suited to his needs. Physically handicapped and mentally retarded children are provided for in our educational systems, and with the passage of the Beadleston law A-125, New Jersey has become the second State in the Nation to expand its program to include help for the moderately disturbed children in schools.

Early recognition, with a sound program planned and carried out, can substantially reduce the burden, to the children themselves, and to society, that will develop if they are left to stumble along until, as young adults, more serious problems send them to institutions for

care.

The expense of implementing such a program is considerable, but it is not too much when compared with the cost of teacher hours lost in every classroom today because time needed for, or distractions caused by, children who are suffering problems of emotional disturbance or social maladjustments; or when compared to the cost of lifelong care.

The benefits of raising the mental health level for the average child

and regular classroom teacher must not be overlooked.

A community program is needed, but to obtain it, today's attitudes must first be changed. Propaganda is not enough. When we demonstrate that something can be done for these children, attitudes will gradually change. Communities must be encouraged by the State, as in turn the State must be encouraged by the Federal Government.

We must begin now, before another generation of troubled children

become the mentally ill adults of tomorrow.

There is a growing awareness of the problem of finding trained

personnel to work in specialized centers.

It is the experience within the pilot study programs of NOMIC that people are interested in finding opportunities to work with seriously disturbed children, and are seeking training programs toward that end. A most practical way to encourage competent workers to enter the field is to provide opportunities for training, and to make them aware of the existence of enough facilities to make the training realistic preparation for employment.

New Jersey's teacher-training programs are only now beginning to conceptualize curriculum at a graduate level for teachers to work with mentally ill children. Such a curriculum, yet to be developed, should include educational methodology and content as well as courses in normal childhood development and psychopathology in children.

Further, it should include orientation and preparation for collaborative work with allied disciplines such as psychiatry, psychology, social

work, pediatrics, and neurology.

Graduate training of this kind should further include supervised fieldwork or supervised training in specific facilities that are directly

working with mentally ill children.

Federal support and encouragement of such training programs is imperative, since State departments of education find it very difficult, if not impossible, to develop and expand regular teacher-training programs through presently existing facilities and faculties.

Any facility that renders direct service to mentally ill chidren on a day or inpatient basis needs to provide ongoing supervision and inservice training to such teachers, making them part of the working

team of experts.

There is considerable variation and looseness in the amount and kind of inservice training now taking place in facilities rendering direct treatment and educational service to mentally ill children.

In New Jersey, the State commission on mental health is working toward raising of standards in care, treatment, and education of men-

tally ill children.

We believe that the Federal and State Governments should work cooperatively in this particularly:

A. In State hospitals, with special attention to mentally ill ado-

lescents-vocational guidance and vocational training;

B. In the provision of halfway houses, or transitional day treatment facilities for children ready for discharge from inpatient facilities, charged with responsibility of accepting State hospital patients.

Helping services to child and family, to protect previous therapeutic investments and to maximize the child's ability to assume a

limited, though productive, role in society must include:

A. Sheltered workshops.

B. Protected employment.

C. Full scale education programs to convince industry to accept

mentally ill young people in employment.

D. Social and psychological service for the child and family, so as to support and enable the child or young adult to take, and to maintain, his place in community living.

A structure for this might be developed by expanding the scope and services of presently existing county and community guidance

centers.

Legislation should be so designed that counties with low population levels can obtain the financial aid that they need to develop and maintain a program of special education and rehabilitation, for a matching fund type of plan in an area with extremely limited resources cannot hope to ever secure enough funds to do so otherwise.

We need both Federal and State financial aid to develop community sponsored and perpetuated programs, given in such a way that funds will be used for the specific purpose of aiding mentally ill and emotionally disturbed children, and not rechanneled into other categories.

Local school districts must be educated to the value of the program, and encouraged to do their part in developing and maintaining such a

program.

We recommend that a stipulated amount of money be designated to setting up the child study teams as provided in A125 in order that the children in New Jersey's public schools may benefit as soon as possible from the services provided therein.

Day hospitals and day treatment centers with public school teachers, or Federal or State payment for teachers at these institutions, could reduce financial and human costs of hospitalization and of ever growing waiting lists.

In the entire field of special education, as in regular education, the States will need the encouragement of appropriate and meaningful

action.

Therefore, we urge that the Federal Government accept the responsibility of providing special training programs for the professional preparation of leadership personnel in the education of emotionally disturbed and mentally ill children, through fellowship programs and/or providing leadership to those institutions involved in the training of teachers whereby a comprehensive national program of training of leadership personnel for education in this specialized area is undertaken in every State in the Union.

We suggest that the Federal Government should further assume responsibility in collecting data from independent, public, and voluntary agencies now rendering inservice training to teachers to develop a body of knowledge pertaining to the ingredients of such training and to augment any Federal program designed toward this end.

We feel that bill H.R. 3465 would provide a much needed service among handicapped persons and we would like to go on record in

support of it.

We are glad the term "mentally handicapped" as used throughout the bill, includes mentally ill and emotionally disturbed persons.

We are encouraged by the rising interest and concern about the many urgent and pressing needs of mentally ill children, and are grateful that this committee is sincerely trying to do something about so important a part of those needs as special education and rehabilitation.

Mr. Daniels. Thank you very much, Dr. Mintz. I am sorry to put a little pressure on, but we are running an hour behind schedule and

people have traveled quite extensively to come here today.

We would like to hear the testimony of all of these witnesses who have been good enough to travel from afar to give us the benefit of their views.

Now, we will only have time to call one more witness and then we

will adjourn for lunch.

At this time I desire to call George F. Meyer, executive director of the New Jersey Commission for the Blind.

STATEMENT OF GEORGE F. MEYER, EXECUTIVE DIRECTOR, COMMISSION FOR THE BLIND, NEWARK, N.J.

Mr. Meyer. Thank you.

Mr. Daniels. Mr. Meyer, you know of the limitation of time that we must place on your testimony.

I do trust that you will be able to give your statement to us.

Mr. Meyer. You give me the bell, will you?

Mr. Daniels. All right.

Mr. Meyer. Because I know these people are hungry.

Mr. Daniels. You may proceed, sir.

Mr. Meyer. I am appearing before the committee here and I appreciate the privilege of coming here primarily at the invitation of the

committee, because I have participated in one or two groups that have prepared material for the committee and I am taking advantage of this opportunity to stress a point of view in connection with certain aspects that would not normally be included in such recommendations

coming from groups.

First of all, I want to say that New Jersey is really quite proud of its program for the blind because it is one of the very few States, almost the only State, where all of the work is incorporated in one organization, which, of course, has a great many advantages from the standpoint of coordinating one program with another and taking advantage of economies that come from the consolidation of the work.

Furthermore, I feel it has been a great privilege to work in four different States, Minnesota, Washington, Ohio, and New Jersey, and also to have worked in the area of education and in the area of

administration and rehabilitation.

To begin with, let me say that in reference to Resolution 494 I think it is a marvelous thing to think that we are taking these steps. I hope that features in behalf of the blind can be included in it.

I think there may not be quite the same need for teachers of the blind, to provide facilities for teachers of the blind, because in so many cases teachers learn on the job to take care of the needs of blind

people.

But I think that is also a weakness. If we look at the two or three thousand teachers who are employed teaching blind children, we find a great many that are not fully qualified and we find that States are extending themselves in order to get well-qualified teachers.

We in New Jersey have drawn upon the interest of socially minded people to make graduate studies possible for likely candidates for

teaching in our schools.

I would like to add one caution, however, and that is that I think any individual who receives a compensation for taking these courses ought in some manner to be psychologically, at least, bound to render service in that connection. I say that because that is not true of some of the existing programs.

People are sometimes sent to take advantage of the training and

then have no obligation to perform the services in the field.

With reference to H.R. 3465, I think it is also an excellent bill. I think that we have to give some consideration to the control of workshops that are authorized in it because experience has shown that without perhaps always intending to do so, the conduct of workshops conducted under private auspices is an undue drain upon the facilities of the community, the charity of the community; they are sometimes competitive one with another, their standards are not at all uniform and in other respects they deserve to be reviewed for the best interests of all concerned.

That is particularly true in light of the fact that we are here in this building encouraging the organization of many more of this type

of service to handicapped people.

Now, the nature of work, of our work in New Jersey, where it is all coordinated, has emphasized to me something that I think has been a problem to both the Federal and the State Governments and that is the distribution of activities for the blind on the Federal level among some 29 different agencies.

Now, it is extremely different for State agencies for the blind, or State agencies, I may say in general, to ascertain the services that are available in all of these sections of government and rather than elaborate upon the entire problem it seems to me that it would be a very constructive thing if some action could be taken on the Federal level by which there would be at least a single high level coordinator who would be an authority on what is available in these separate activities.

Mr. Crampton tells me they are issuing a book of 600 pages telling what is available in these 29 different agencies, but it takes an awful lot of time to read a 600-page book and there are not many people

who are going to take the trouble to read it.

I think we need, furthermore, a specific interpretation of some of these services so that they may be correlated one with another and

also with the facilities within the State.

The relationship between the independent living bill under rehabilitation and its execution under the assistance program is something I think that ought to give us pause because the objectives are completely different.

One of the things that concerns me is the fact that agencies for the blind are precisely in the middle of the whole situation because they have candidates in both fields and, therefore, we always have experi-

ence in the handling of blind people in their homes.

The thing I would plead for is that any services that are extended to blind people in any one of these programs, automatically they would be extended through the rehabilitation program anyhow, but if they are extended to the assistance program that should be coordinated with the services to the blind because they are the one agency that knows what blind people need.

Mr. Daniels. I was just about to sound the bell to advise you that

you had about 2 more minutes to go.

Mr. Meyers. Then I would put stress on something that was brought up here and will undoubtedly be brought up again on the needs of multihandicapped blind children. More and more we are finding that blind children come to us with brain injuries, with emotional disturbances, and various other types of handicaps that combined with blindness cause a situation that is very, very difficult to meet.

We have on our educational program a policy of gearing the program of education to the need of the child and in some of these instances we find that the treatment that the child needs may run as high as five and six thousand dollars a year in order to put him into a position of profiting from his education. That is a cost that we are not

in a position to meet.

Mr. Daniels. Does the child get that directly from the New Jersey

Commission for the Blind?

Mr. Meyers. Normally he would.

Mr. Daniels. How about the local school system?

Mr. Meyers. Actually the New Jersey Commission for the Blind draws together the facilities of the local school system and residential schools and our own staff. We have a staff of 20 teachers that coordinate with the public school system to take care of some 600 blind children right in the public schools as your child goes to the public schools.

Then, of course, we have some 80 or 90 children that we send to residential schools. Of course, within the State also we have some 150 children that attend the schools that you have heard about in Jersey

City here, for the partially sighted.

There is one more point I would like to make. That is that we become so enamored with our idea of programs that we sometimes lose sight of the purpose of all of the programs. I am thinking particularly of the matter of sight restoration. We have no program of sight restoration and the program of sight restoration varies from State to State.

It is surprising how many people are not able to get the service that

they need for sight restoration.

Now, from an economic standpoint, I am sure you can appreciate the fact that if you restore the vision of a child of 5, you have saved a good many thousand dollars in his education and you have saved a good many more thousand dollars in the field of assistance or rehabilitation, yet there is no provision made for that kind of service.

We have to wait until he gets his education and comes up to the age of 21 or 18, before we have the finances available through Federal con-

tributions to make an operation available to him.

Now, thank God, of course, some of the States provide that out of their own funds, but that is not done universally and we ought to look to see that that kind of service, physical restoration, particularly sight restoration, becomes available to the people at the earliest age to the benefit of everybody.

I want to say just a word on housing. We make a provision for public housing for people who have low incomes and, of course, many, many blind people have low incomes. Most of them have. Yet the competition that we have in the urban sections for the public housing that is available pushes out the people who sometimes deserve it most, such as the handicapped, the aged, and the blind.

It seems to me that it is only fair that some provision be made by which a quota system would be set up so that they might have at least a toe in the door to get a chance at some of these low-priced housings

that are available.

Thank you.

Mr. Daniels. Thank you very kindly for your testimony. It has been most helpful and beneficial to the committee. We appreciate your coming here today.

Mr. Meyers. Thank you.

Mr. Daniels. Now we will adjourn and return here at 1:45 to continue with the hearings this afternoon.

We are running about an hour behind schedule. I do hope that this afternoon we can make up that lost time.

The first witness this afternoon will be Joseph Feinman.

(Thereupon, at 12:40 p.m., the subcommittee was recessed, to reconvene at 1:45 p.m., same day.)

AFTERNOON SESSION

The subcommittee reconvened at 1:45 p.m., upon the expiration of the recess.

Mr. Elliott. The subcommittee will be in order.

In our absence two ladies who were invited to testify tomorrow, namely, Mrs. Kitty Shinton and Mrs. Sheridan, have filed statements for our record. They will not be present to testify orally.

Without objection, those two statements will be made a part of the

record.

(The statements referred to follow:)

FEBRUARY 18, 1960.

DEAR SIR: As parents of deaf children, we are writing to ask your help in securing the passage of Senate Joint Resolution 127.

This legislation is designed to help alleviate the national shortage of classroom teachers of deaf children, speech pathologists, and audiologists through

scholarships and grants to training centers.

As parents of deaf children we are particularly concerned with the teacher shortage. The Department of Health, Education, and Welfare states that the greatest teacher shortage exists in this area of exceptionality. Approximately 500 additional teachers are needed for next fall, and training centers have turned out only 125 this year.

As parents we are vitally concerned that our children not be denied educational opportunity because of the teacher shortage. There are some 30,000 deaf children of school age whose parents are anxiously concerned about the increasingly desperate shortage. With proper education we can expect that our children will grow up to be useful, productive citizens. Over the past 10 years, enrollment of deaf children in schools for the deaf has increased about 400 per year. Last year the increase was 900.

Providing trained teachers of the deaf must become a Federal concern because individual States have no training facilities. There are 22 accredited training centers in this country. With additional funds they could provide a

substantially greater number of teachers.

Organizations which have united to secure the passage of the proposed legislation are the Alexander Graham Bell Association for the Deaf, the Conference of Executives of American Schools for the Deaf, the Convention of American Instructors of the Deaf, and the parents' section of the Alexander Graham Bell Association.

We would appreciate your support of this legislation.

Sincerely yours,

Mrs. Kitty Shinton. February 18, 1960.

PHILADELPHIA, PA.

Hon. Carl Elliott,

Chairman, Subcommittee on Special Education.

HONGRABLE DEAR SIR: One of the most serious problems in the field of education is in the field of the education of the deaf, especially the great shortage of trained teachers. We would like to submit the following suggestions:

A definite plan for training teachers for the deaf must consist of a combined program of a university or college and a school for the deaf. Philadelphia can-

not boast of this, the fourth largest city in the Nation.

Two outstanding programs of this type are at the Clerke School, Northampton, Mass., and the Central Institute, St. Louis, Mo. Even these two programs could be expanded and improved upon with Federal funds. Such programs should be established throughout the eastern Atlantic region, where there are many universities and colleges, as well as schools for the deaf. Funds should be made available to qualified students desiring to become teachers of the deaf.

Federal funds should be used to boost the salaries of these teachers. In Philadelphia the salaries of the teachers for the deaf are below standards. This is a very grave and embarrassing situation and not until we have properly trained and adequately paid teachers will the education for the deaf not be con-

sidered one of the most neglected segments of education.

Very truly yours,

Mrs. Kitty Shinton, Mrs. Regina H. Sheridan, Parents of the Deaf.

Mr. Elliott. Mrs. John M. Alton, president of the New Jersey State Federation of Women's Clubs, wires that an accident prevents her from appearing this afternoon, but that she will send a statement for the record.

Without objection, that telegram also will be made a part of the record.

(The telegram referred to follows:)

ATLANTIC CITY, N.J., February 18, 1960.

Congressman Carl Elliott,

Chairman, Subcommittee on Special Education, Assembly Chambers, Hudson Administration Building, Jersey City, N.J.:

Regret accident prevents appearing this afternoon. Will send statement.

Mrs. John M. Alton.

President, New Jersey State Federation of Women's Clubs.

Mr. Elliott. Our next witness is Mr. Joseph Feinman of the New Jersey Association for Retarded Children, of Trenton, N.J.

Is Mr. Feinman here?

Mr. Feinman, may I say to you that we are running a bit behind time and, as much as I regret to do so, I must impose a time limitation of 10 minutes upon your testimony.

You use that 10 minutes in any way you see fit. If you have a written statement, it will be made a part of the record, if you desire,

following your oral remarks.

Now, you may proceed.

STATEMENT OF JOSEPH FEINMAN, NEW JERSEY ASSOCIATION FOR RETARDED CHIDREN, TRENTON, N.J.

Mr. Feinman. Mr. Chairman, honorable members of the Subcommittee on Special Education of the U.S. House of Representatives on Education and Labor, I am an attorney of this State. I appear not in that capacity, but on behalf of the New Jersey Association for Retarded Children, a nonprofit statewide organization of some 2,500 members, most of whom are parents of a mentally retarded child.

I, too, am a parent of a mentally retarded child.

Mr. Chairman, the tremendous postwar population growth of New Jersey, the heavy concentration in this State of military bases with an unusually large number of military transients in training, and the enactment in New Jersey of the Beadleston Act, which guarantees education and training to the educable and trainable mentally retarded, these have all resulted in a need for teachers trained to teach the mentally retarded.

The most urgent need in New Jersey today in the field of special education for the mentally retarded is a critical shortage of trained

teachers.

This critical need has been known to the Congress which enacted legislation designed to provide a flow of such trained teachers.

Under the National Defense Education Act, grants are provided to colleges and universities for fellowships to graduate students and, since the enactment of this law, one set of fellowships in the field of special education has been awarded by the Office of Education to Wayne University.

Under Public Law 85-926, grants are also provided to colleges and universities for such fellowships, as well as further grants to State departments of education for fellowships and scholarships to those who desire to enter the field of teaching the mentally retarded.

The congressional intent is to be applauded. The result, to date, however, has been a mere trickle of trained teachers, and the critical need for such teachers continues to exist and becomes more critical from day to day.

Mr. Elliott. May I ask the gentlemen, is not the reason for that the fact that we were late about getting the appropriation made under the bill to which he refers, to train teachers for the mentally retarded?

My recollection is that we passed that bill on the last legislative day of the 2d session of the 85th Congress, sometime in August or September 1958. Then for that year we did not have an appropriation because we did not pass the bill soon enough to get an appropriation that year.

So our first appropriation under that bill came about midway of 1959, which means that we are now in the midst of about the first school year under that bill. Is that not the reason for apparently

being so long and slow getting started?

Mr. Feinman. I think, Congressman Elliott, that is only part of

the reason.

Mr. Elliott. We did appropriate a million dollars to start that

teaching program, it is my recollection.

Mr. Feinman. As my presentation will exhibit, the reason, as we see it, is that not enough money has been appropriated and, therefore, only a trickle will ever come out. The pump has to be primed.

To properly implement the intention of Congress, the New Jersey Association for Retarded Children recommends that much larger sums of money be appropriated so as to multiply the output of trained teachers.

The laws adopted by Congress to date, to fill this acknowledged void, have been both long range and short range in nature. Implemen-

tations, however, have been short range only.

Under Public Law 85–926, the Office of Education has acted in the direction of providing trained teachers as quickly as possible, and although Public Law 85–926 provides for Federal grants to colleges and universities to help underwrite programs for training of teachers of the mentally retarded, i.e., creation of a faculty of special education, nevertheless the Office of Education has been unable to do anything in this direction. Whether because of lack of funds, or because of the lack of a direct congressional mandate, we cannot say.

In any event, the New Jersey Association for Retarded Children recommends to this committee the implementation of the congressional long-range plan of training teachers, either by providing additional appropriations to enable the Office of Education to execute such a program, or by new companion legislation spelling out a direct mandate of grants to selected and qualified universities and colleges to

create and develop departments of special education.

Departments of special education, staffed with trained faculties, are today few and far between. Creation of such departments of special education will enable our institutions of higher learning to teach student teachers the things that they must know and do with the mentally retarded youngster.

Our critical need, both now and in the future, is not only quantity,

but also quality.

Our association is also very much interested in the independent living bill, H.R. 3465, and endorses its provisions completely. We who

are parents of mentally retarded children know that their intellectual range varies all the way from the crib case to the borderline case, with

many gradations in between.

As a private agency, operating with our own funds, funds solicited from the public, and with funds provided by the New Jersey Rehabilitation Commission, we have met an unusually large number of cases where rehabilitation services would have resulted in less dependency, or employment under sheltered conditions in a terminal workshop.

None of these mental retardates were eligible for services because they could not be certified as having a reasonable expectation of being

employable following rehabilitation services.

Our association sponsors—by itself and with other agencies—eight such workshops and occupational centers in New Jersey, in which

about 200 mentally retarded persons are receiving services.

During the fiscal year 1958-59, 111 others were denied services because they did not completely fall within the definition of the existing law-or meet similar criteria of vocational training as provided by the workshop program—yet most, if not all of these 111 would have benefited by rehabilitation services; would have benefited by rehabilitation services and would have become less dependent on others, and would have achieved greater independence than before.

We heartily endorse the independent living bill as a recognition by its congressional sponsors that human beings, and mentally retarded persons are just such, should never be denied a chance for self-

improvement.

These sheltered workshops and training centers are a new and significant development. The oldest was opened in 1954. There is much that they can learn from each other. Our workshops can learn from those in other States and, we hope, vice versa.

Last week the U.S. Office of Vocational Rehabilitation and the National Association for Retarded Children cosponsored a conference in Dallas, Tex., on research in behalf of the retarded, especially as

exemplified by such workshops and training centers.

In talking with one of the two New Jerseyites who participated I was impressed with the value which such conferences can have on a national or regional basis, especially at this stage of the development of sheltered workshop idea.

We commend the Office of Vocational Rehabilitation for initiating this idea and hope they will receive encouragement from your com-

mittee.

Thank you very much.

Mr. Elliott. Thank you very much, Mr. Feinman. We appreciate your testimony.

STATEMENT BY JOSEPH FEINMAN, STATE CHAIRMAN OF THE LEGISLATIVE COMMIT-TEE OF THE NEW JERSEY ASSOCIATON FOR RETARDED CHILDREN

Mr. Chairman and honorable members of the Subcommittee on Special Education of the U.S. House of Representatives on Education and Labor, I appear on behalf of the New Jersey Association for Retarded Children, a nonprofit statewide organization of some 2,500 members, most of whom are parents of a mentally retarded child.

The tremendous postwar population growth of New Jersey, the heavy concentration in this State of military bases with an unusually large number of military transients in training, and the enactment in New Jersey of the Beadleston Act which guarantees education and training to the educable and

trainable mentally retarded—these have all resulted in a need for teachers trained to teach the mentally retarded. The most urgent need in New Jersey today in the field of special education for the mentally retarded is a critical short-

age of trained teachers.

This critical need has been known to the Congress, which enacted legislation designed to provide a flow of such trained teachers. Under the National Defense Education Act, grants are provided to colleges and universities for fellowships to graduate students, and since the enactment of this law, one set of fellowships in the field of special education has been awarded by the Office of Education to Wayne University. Under Public Law 85–926, grants are also provided to colleges and universities for such fellowships, as well as further grants to State departments of education for fellowships and scholarships to those who desire to enter the field of teaching the mentally retarded.

The congressional intent is to be applauded. The result, to date, however, has been a mere trickle of trained teachers, and the critical need for such teachers

continues to exist and becomes more critical from day to day.

To properly implement the intention of Congress, the New Jersey Association for Retarded Children recommends that much larger sums of money be

appropriated so as to multiply the output of trained teachers.

The laws adopted by Congress to date, to fill this acknowledged void, have been both long range and short range, in nature. Implementation, however, has been short range only. Under Public Law 85-926, the Office of Education has acted in the direction of providing trained teachers as quickly as possible, and although Public Law 85-926 provides for Federal grants to colleges and universities to help underwrite programs for training of teachers of teachers of the mentally retarded, i.e., creation of a faculty of special education, nevertheless the Office of Education has been unable to do anything in this direction. Whether because of lack of funds, or because of the lack of a direct congressional mandate, we cannot say. In any event, the New Jersey Association for Retarded Children recommends to this committee the implementation of the congressional long-range plan of training teachers of teachers, either by providing additional appropriations to enable the Office of Education to execute such a program, or by new companion legislation spelling out a direct mandate of grants to selected and qualified universities and colleges to create and develop departments of special education. Departments of special education, staffed with trained faculties, are today few and far between. Creation of such departments of special education will enable our institutions of higher learning to teach student teachers the things they must know and do with the mentally retarded youngster. Our critical need, both now and in the future, is not only quantity, but also quality.

Our association is also very much interested in the independent living bill (H.R. 3465) and endorses its provisions completely. We who are parents of mentally retarded children know that their intellectual range varies all the way from the crib case to the borderline case, with many gradations in between. As a private agency, operating with our own funds, funds solicited from the public, and with funds provided by the New Jersey Rehabilitation Commission, we have met an unusually large number of cases where rehabilitation services would have resulted in less dependency, or employment under sheltered condi-tions in a terminal workshop. None of these mental retardates were eligible for services because they could not be certified as having a reasonable expecta-

tion of being employable following rehabilitation services.

Our association sponsors (by itself and with other agencies) eight such workshops and occupational centers in New Jersey, in which about 220 mentally retarded persons are receiving services. During the fiscal year 1958–59, 111 others were denied services because they did not completely fall within the definition of the existing law or meet similar criteria of vocational training as provided by the workshop program, yet most, if not all of these 111 would have benefited by rehabilitation services—would have become less dependent on others, and would have achieved greater independence than before. We heartily endorse the independent living bill as a recognition by its congressional sponsors that human beings—and mentally retarded persons are just such—should never be denied a chance for self-improvement.

These sheltered workshops and training centers are a new and significant development; the oldest was opened in 1954. There is much they can learn from each other. Our workshops can learn from those in other States and—we hope—vice versa. Last week the U.S. Office of Vocational Rehabilitation and the National Association for Retarded Children cosponsored a conference in Dallas, Tex., on research in behalf of the retarded, especially as exemplified by such workshops and training centers. In talking with one of the two New Jerseyites who participated, I was impressed with the value which such conferences can have on a national or regional basis, especially at this stage of the development of the sheltered workshop idea. We commend the Office of Vocational Rehabilitation for initiating this idea and hope they will receive encouragement from your committee.

Mr. Elliott. Our next witness is William T. Wiest, Jr., executive director, Eastern Delaware Association for Retarded Children, Wilmington, Del.

Mr. Wiest, will you come around, sir?

STATEMENT OF WILLIAM T. WIEST, JR., EXECUTIVE DIRECTOR, DELAWARE ASSOCIATION FOR RETARDED CHILDREN, WILMINGTON, DEL.

Mr. Wiest. Mr. Chairman, I brought with me Mr. Bart A. Milano, executive director of a sheltered workshop. Mr. Milano was invited by you to testify. However, this came to his attention too late to write to you for a chance.

If you are in agreement, I would be glad to share my time with

him.

Mr. Elliott. Yes, will you invite him around?

Mr. Wiest. Suppose I take 5 minutes for mine and give him the other 5 minutes?

Mr. Elliott. That will be fine.

Mr. Wiest. I am here, Mr. Chairman, representing the Delaware

State Association for Mentally Retarded Children.

Our reason for existing is to better the lives of the mentally retarded of all ages and degrees of handicap, as well as to promote basic research which may lead to the prevention and amelioration of mental retardation.

We have an estimated 10,000 to 12,000 mental retardates in our small State of Delaware, who are our most direct concern. We also work with our parent organization, the National Association for Retarded Children, and other organizations, to promote the welfare of

the mentally retarded elsewhere.

I had the privilege of being invited to attend the section on mental retardation of the study group for the eastern Atlantic region which met in Philadelphia for 2 days earlier this week. While I was able to be in attendance only the first day that the study group met, I witnessed a lot of good thinking taking place and ideas being born concerning the identification education and training, and vocational rehabilitation of the retarded.

I feel sure that whoever has been elected to present testimony for that group at this hearing will have much of interest to report.

I would like to limit my testimony to speaking out in favor of H.R. 3465, sometimes referred to as the independent living bill.

Section 201, title II of H.R. 3465, says, in part:

Authorization of appropriations for grants, purpose for which available, for the purpose of assisting the States in rehabilitating handicapped individuals who, as a result of such rehabilitation, may be expected to achieve such ability of independent living as to dispense with or largely dispense with the need for institutional care, or, if not institutionalized, to dispense with, or largely dis-

pense with, the need for an attendant, thereby reducing their burden upon others and contributing to their dignity and self-respect.

Under section 206(b), title II, it reads:

The term "handicapped individual" means an individual of employable age, as defined by regulations of the Secretary, who is under such physical or mental disability as to require institutional care or attendance in his household continuously or for a substantial portion of the time, but who can be reasonably expected, as a result of rehabilitation services to achieve such ability of independent living that he will no longer require such institutional care or such attendance in his household.

I believe these definitions include a young man I know whom I shall call John. John, a Delawarean, is 22 years old and markedly mentally retarded. John is not alone. There are thousands like him

in the United States.

John attended a parent-operated school for the trainable mentally retarded for several years before such classes were provided by our public schools in Delaware. Thereafter he attended a public school class for trainables for 2 years until he reached his 21st birthday, and had to leave because the schools could not legally keep him longer.

John then attended, on a trial basis, a sheltered workshop in Wil-

mington for the mentally and physically handicapped.

Although every effort was made on the part of the workshop staff to make John's trial a successful one, he did not make the grade. It was found that it was not possible for John to adjust to the require-

ments of the sheltered workshop and to profit from it.

In the report made at the time of his termination the idea was expressed that John's failure did not result so much from an intellectual inability to learn some of the simple, routine jobs done at the sheltered workshop, but, more from his present inability to conform to any kind of a work schedule. The door was left open for a future trial at the sheltered workshop if John could mature in his personal behavior.

Very possibly John would not be having this trouble today if we had had good schools for trainable children when he was very young and if, over the years, he could have been slowly, but systematically trained in a formal learning situation to make maximum use of his potential capacities, which even today are still apparent, but not fully

exploited.

People did the best they could for John in his early life, but the

facilities available were not adequate.

Within the next 5 to 10 years in Delaware, and perhaps longer in some parts of the country, I visualize similar casualties such as John, people who haven't really had much of a chance, even if they did manage to get into a class for trainables somewhere in the middle or latter part of their school-age years.

Even after the 5- to 10-year period I visualize similar casualties in

cases where home or school is inadequate to meet the need.

I believe that many of these people can still be salvaged, but they will need an intermediate step between school and employment. They need a place where old habits can be broken down and new ones built up; a place where, taking as much time as may be necessary, these people can be helped to improve in personal maturity and develop good work habits—to be differentiated from work skills.

While this is not vocational rehabilitation in the broadest sense, it is rehabilitation in the fullest sense, and, I believe, frequently a vital

step before vocational rehabilitation.

I have no doubt that some of the people with problems similar to John's—and I may add I believe that may be as many as one-half of those who terminate attendance in our public-school classes for trainables in the years immediately ahead—will be able to become partially self-supporting adults after an experience such as H.R. 3465 could provide.

I do not know how much there are, but I am guessing and I am afraid that my guess may be a conservative estimate that half of the people who finish our public-school classes for trainables in the years about to come will be like John. They possibly would be able to engage in some remunerative employment if they had been to an

adequate training.

They don't have one which is not their fault, but I think they can

still get it.

In addition to that, I would like to say I realize, too, that some of these people, even with this special training, are not going to be able to do remunerative employment. I know that some will.

I would not even want to hazard a guess as to how many won't be able to. I would like to say, though, even so I think the money

will be very well invested.

In many of these cases the experience will make it unnecessary to institutionalize the retardate or will greatly reduce the amount of

attendance and custodial care he will require at home.

To top all this, these people will have a place to go each day where they will engage in a constructive program with their peers. They need not be the misfits who sit at home with nothing to do while parents, brothers, and sisters pursue their various vocational, educational, and recreational pursuits.

To go back to section 201, title II of H.R. 3465, this bill has the potentiality of doing exactly what this section says: "reducing their burden upon others and contributing to their dignity and self-

respect:"

How can a society with our fine Judaic-Christian heritage think of doing less for them?

Thank you.

Mr. Elliott. Mr. Wiest, if you are going to give the other gentleman half your time, I guess we will have to stop here.

Mr. Wiest. Thank you.

This is Mr. Bart Milano, executive director of Opportunities Center, Inc., a sheltered workshop in Delaware.

Mr. Elliott. What town of Delaware are you from?

STATEMENT OF BART A. MILANO, EXECUTIVE DIRECTOR, OPPORTUNITY CENTER, INC., WILMINGTON, DEL.

Mr. Milano. Wilmington, sir.

I am executive director of Opportunity Center, Inc., a workshop for training and employing the handicapped, located in Wilmington, Del. We started operating in 1957 with 2 employees and now have 102

disabled presons in training and employment.

Our center serves all types of handicapped, physically, mentally retarded, and emotionally disturbed. We do work primarily on a contract basis, and we have the following departments: Printing, photography, clerical, upholstery, refinishing, woodshop, sewing, letter shop, radio, television, and appliance repair; in addition we do various miscellaneous work, such as packaging, sign lettering, car washing and polishing, mailing, stuffing and sealing envelopes, and so forth.

To date we have placed in competitive employment 32 persons. In 1958 we applied for and received a Federal grant for the establishment of a demonstration project, a work-adjustment program for the severely handicapped. This is a 3-year project and, after being in operation for a year and a half, 90 disabled persons have been given an evaluation period under actual working conditions, to determine their ability to work, and to teach them proper work habits and

work behavior.
We appreciate the help of the Federal Government in this important

phase of our work.

I would also like to mention the cooperation given to us by the Delaware Vocational Rehabilitation Division. This agency, under its director, John G. King, screens all applicants referred to our workshop, and provides all the diagnosis for them, medical as well as psychological.

The agency's counselors supervise the persons during the workadjustment training, the vocational training which follows, and also helps in placing them. We feel that this relationship between a private organization and a State-Federal one is an excellent one, and

helps us jointly to help the disabled.

We feel that our workshop is now an important part of the community, since by providing jobs we have helped to lessen somewhat the

burden on the taxpayer.

It is interesting to note that many of our employees were receiving public-welfare benefits, or were in tax-supported institutions, at time of referral to the Delaware Vocational Rehabilitation Division. There were 72 disabled persons at the center during the past year alone, whose source of support was from welfare or an institution; 29 of these were receiving State welfare; 13 were in the Delaware State Hospital mental institutions; 8 were in a State health center; 7 were in the State hospital for the mentally retarded; 13 were in other tax-supported State institutions; and 2 were supported by private institutions.

Our workshop will probably need to be expanded, and we have need

for a similar workshop in the downstate area.

It is extremely difficult to initiate and to keep in operation such

workshops without financial assistance from many sources.

The Federal Government was aware of this and has, through Public Law 565, the Vocational Rehabilitation Amendments of 1954, provided grants for the establishment of facilities.

However, except for demonstration grants, most Federal grants for workshops provide that such workshops must be comprehensive in nature, that is, provide medical as well as diagnostic and training services.

In most areas the medical services are already established and work-

shops do not want to duplicate any services.

We feel that workshops are needed throughout the country, and that the Federal Government could render valuable assistance in helping to establish workshops only for training and employing the handicapped, excluding the medical service requirement.

H.R. 3465 also provides for establishing rehabilitation centers and workshops and I am heartily in favor of this bill. I am not sure whether medical services have to be a part of the workshop or not-I hope not, since we in Delaware have fine medical facilities, but do need places to train and especially employ the disabled in a sheltered workshop type of facility.

Mr. Elliott. Thank you very much for your kindness.

Is the Reverend Richard M. McGinnis, director of Mount Carmel Guild, here?

Father McGinnis. Yes, sir.

Mr. Elliott. Will you come around, Father McGinnis?

STATEMENT OF REV. RICHARD M. McGINNIS, DIRECTOR, MOUNT CARMEL GUILD, NEWARK, N.J.

Father McGinnis. If it is agreeable with the committee, I would like to express my thanks for coming here. I would like to submit my report in written fashion tomorrow.

Mr. Elliott. Without objection, the report of the Reverend Richard M. McGinnis, director of the Mount Carmel Guild, will be made a part of the record at this point when the report has been submitted.

Will you state for the record just a word about your background,

Father?

Father McGinnis. I am director of the Mount Carmel Guild Center for the Blind in Newark, which is an agency which has educational and rehabilitative classes for the blind as well as social activities.

We work with over 800 blind people of this area. Our center is located at 99 Central Avenue, Newark, N.J. We have a system of classes in the evening which we hope will make all persons more independent and better able to live in the world. That is the purpose of our program.

Mr. Elliott. How old is your institution?

Father McGinnis. Our department for the blind is actually 20 years old and has had a central meeting place, a central location where these activities have been carried on over the last 4 years.

Mr. Elliott. Thank you very much, Father.

Our next witness is Mr. James Fraser, of Goodwill Industries, Camden, N.J., executive director of Goodwill Industries.

You may proceed, Mr. Fraser.

I regret that we must limit you to 10 minutes.

STATEMENT OF JAMES FRASER, EXECUTIVE DIRECTOR, GOODWILL INDUSTRIES OF SOUTHERN NEW JERSEY

Mr. Fraser. I wish to express my sincere appreciation for this

privilege of appearing at this important meeting.

I would like to give a brief history of the progress of the Goodwill Industries of Southern New Jersey, because it is pertinent to some of the facts that I wish to state later.

Mr. Elliott. Let me ask you a question: How many Goodwill Industries are there in America?

Mr. Fraser. 122.

Mr. Ециотт. In every State?

Mr. Fraser. That is in every State.

Mr. Elliott. How many people do those industries employ as of now?

Mr. Fraser. I think it is about 22,000.

Mr. Elliott. Thank you, sir. Mr. Fraser. We were organized in April 1950, in the back room of a small church in South Camden, two handicapped employees were hired and a privately owned station wagon was borrowed at this point.

Shortly thereafter a three-story building was rented with a 20-foot store front. By 1953 the organization had purchased a 12,000-squarefoot building with 14 handicapped employees and a yearly budget of

less than \$40,000.

In 1958, a 38,000-square-foot building was purchased. conclusion of 1959 the annual budget had grown to \$150,000 and 80 persons were on the payroll and, as you might surmise, this growth had many causes.

We wish to acknowledge with gratitude the highest praise for the help and interest in our program shown by the members of the

New Jersey State Rehabilitation Commission.

We have also been assisted by the Veterans' Administration and the Camden County United Fund, and in 1957 we received Federal and State grants under section 4(a)(2) Vocational Rehabilitation Act.

This came at the most opportune time for our growth. With these improved facilities, our program took an immediate advancement in our possibilities of serving the handicapped of our area. We are sure because of building space and a backlog of over 200 applicants and there would be many, many more if we solicited them, we can make further advance in our services to the handicapped.

I would like to give you some of our thinking and plans for the

future:

1. We wish to increase the prime factor of our program which is to give employment to the handicapped persons who find it next to impossible to get such employment in normal industries.

This will be done by expanding our work program of used goods. 2. We have need for contract work such as assembling and simple manufacturing for handicapped people that need to be seated while

working. This need could be supplemented by Government subcontracts.

We urge that we be considered in such contracts. 3. We hope to increase in amount and in proficiency our present training program for the handicapped in cooperation with the State

rehabilitation commission and the Veterans' Administration.

4. We hope to fulfill a need in our areas either by ourselves or in cooperation with other agencies some rehabilitation in the form of clinic needs, for instance, periodic physical examinations by a physician to determine the capacity or limits of our employes for working.

As more and more retarded clients appeal to us and are employed, we also feel the need of psychiatric examinations to determine their capacities and advancement. We hope to improve our counseling and social services and to be able to do this we feel the great need for professional training to prepare staff for these projects. We would like to emphasize and urge this need for the training of such professional help.

We have become aware of the need for workshop help in other areas of our territory, mainly Mercer County, of which Trenton, our capital, is in center. Also, in Cumberland and surrounding counties

in the southern part of our State.

As this area is largely rural and farm, we are contemplating a farm help training program for the retarded and other handicapped.

With moderate help this portion of our population could be given

the same benefits of help provided elsewhere.

In cooperation with the Union Organizations for Social Services, sponsored by the Joint Council of AFL and CIO of Camden County, we are contemplating opening a recreation and service project for aged and retired persons of this area. This will provide recreation, entertainment, meeting place, lunch facilities, counseling, and other type of assistance that can be given to the aged. This could also be used as a base for independent living rehabilitation.

We know that our program for the future is a momentous one, but with some assistance, which must be gotten outside of our nonprofit program, advancement can be made in all these fields and our plans

completed.

I again wish to express my appreciation for this privilege of presenting this testimony in behalf of the handicapped persons in the southern half of New Jersey.

Thank you.

Mr. Elliott. Thank you very much, Mr. Fraser.

Mr. Fraser. Thank you, Mr. Chairman.

Mr. Elliott. I recognize Dr. Barnard for a request now.

Dr. BARNARD. Mr. Chairman, I would like to request that the statement of Mr. Philip M. Hyman, executive director for the Associated Placement and Guidance Bureau, be made an official part of the record at this point.

Mr. Elliott. Mr. Hyman is from Baltimore?

Dr. Barnard. Yes, sir. Mr. Elliott. Without objection, the statement of Mr. Hyman will be made a part of the record at this point.

(The statement referred to follows:)

STATEMENT OF PHILIP M. HYMAN, EXECUTIVE DIRECTOR, ASSOCIATED PLACEMENT AND GUIDANCE BUREAU

I am a placement counselor employed in a private social agency. Our main focus is to place handicapped persons in suitable employment. We direct such skills as we possess toward an alinement between handicapped jobseekers and industry's personnel needs. Our financial support comes from the Associated Jewish Charities of Baltimore. We receive no subsidies from the Federal, State, or municipal government, but we do utilize and lean heavily on our State rehabilitation service for vocational training and retraining of our handicapped clients.

In these brief minutes allotted me I will not attempt to saturate this hearing with statistics on our unmet social needs in Baltimore and the State of Maryland. Congressman Elliott's bills clearly recognize these deficiencies and I am certain that each community across these United States has generic problems and kindred frustrations.

Prior to this meeting I visited with Mr. R. C. Thompson, State director of the Division of Vocational Rehabilitation of the State of Maryland. I learned that

his agency has been able to service less than one-third of all eligible applicants who require rehabilitative services. Thirty-five counselors cover the State with an average caseload of 200 clients. When funds which are earmarked for rehabilitative purposes are exhausted during any given year, this agency, of necessity, must deny services until the next fiscal year. Thirty-five counselors are heavily burdened with a caseload that should be distributed between 100 coun-An ongoing year-round, inservice training program for vocational counselors in this agency is recommended by Mr. Thompson in order to enhance their effectiveness by keeping abreast with changes and trends in their field.

Our sheltered workshops are loaded to maximum client capacity almost all Two of our largest shops are of the terminal variety and are populated largely with a clientele so severely handicapped that their employment in a competitive setting is hardly possible. Periodic layoffs occur at these

shops because of the lack of funds or lack of contracts or both of these.

I have studied with a great deal of interest Congressman Elliott's bill dealing with independent living and subscribe in principle to his purposes regarding the social and economic salvaging of our human resources. I agree with him that, given the proper tools and professional know-how, a much more effective rehabili-

tation job can be done, must be done, and will be done.

If our handicapped population do not receive the benefit of a thoroughgoing vocation training program which is realistically attuned to modern industrial needs, then our communities will be faced with relief costs that could reach staggering and fantastic proportions. The cheapest buy in this country when measured in terms of human and dollar values is vocational rehabilitation; the most expensive buy is a laissez-faire attitude. Each handicapped, untrained, unskilled, and unemployed person in our country who is even marginally salvagable in an economic and social sense should be exposed to whatever rehabilitative resources we possess. And, if our rehabilitation processes are ineffectual then, they should be overhauled and strengthened. We cannot have a strong America unless we have a gainfully employed America. Industry will buy productive workers only; it cannot afford anything else.

I do not believe that Congressman Elliott's bill for independent living is a sinister in-patient versus out-patient issue as some of my more apprehensive colleagues are inferring. Congressman Elliott is, I trust, fully aware of the facts and undoubtedly recognizes that a statistically certain percentage of hard cores among the handicapped are beyond reclaim regardless of what modern medical psychiatric and educational techniques we employ. His bill, as I see it, means to harness all of our National and State rehabilitation resources, put the thing into high gear, salvage the salvagables, cut down on "expensive institutional care" and restore to many of the handicapped their dignity and self-

respect.

I should like to see appended to the independent living bill a request to the Secretary that the Governors of our States appoint training and employment advisory councils composed of local businessmen wherever rehabilitation facilities exist. Job training for the handicapped should be indigenous to the employment opportunities usually aavilable in local communities wherever and whenever practical. It is reasonable to assume that management will cooperate and contribute valuable suggestions as to the soundness and validity of training programs as it relates to their own local labor needs.

I salute and applaud Congressman Elliott's goals as expressed and implied in his independent living bill. It is most comforting and reassuring to those of us who toil in the vineyards of rehabilitation work to know that a strong voice and force has been raised in behalf of the hurt, the frightened, and the insecure.

Mr. Elliott. Our next witness is Dr. Kingsley Price, of the Department of Philosophy and Education of Johns Hopkins University.

Dr. Kingsley Price.

STATEMENT OF DR. KINGSLEY PRICE, DEPARTMENT OF PHILOS-OPHY AND EDUCATION, JOHNS HOPKINS UNIVERSITY

Mr. Price. Mr. Chairman and members of the subcommittee, I want to thank you for letting me talk to you today in your proceedings.

I would like, if I may, to tell you just a little bit about who I am, which will, I think, clarify some of the points I want to make later.

Second, to make some remarks about the objectives of education of the blind and rehabilitate the blind and, third, to mention two kinds of needs of the blind which I think these programs at present do not completely satisfy.

I am not, myself, connected in any professional way with work for the blind. I never have held a position of this sort and I do not

expect to.

I am a teacher at Johns Hopkins University. I write on philosophical topics and I expect to spend the rest of my life doing this kind of work and perhaps being a scholar of the literature of philosophy.

Nevertheless, from my college days as a blind person I have had a warm and active interest in the problems of the blind and have worked part of my spare time with organizations of the blind who were con-

cerned in solving these problems.

Continuing that nonprofessional interest, I am now a member of the advisory committee on book selection to the Library of Congress Division for the Blind, and a member of the board of directors of the National Federation of the Blind, which I believe I may say I represent here today.

Mr. Elliott. Do you represent and speak for the National Fed-

eration of the Blind?

Mr. Price. That is right.

Now, gentlemen, I would like very briefly to remind you of the kind of objective which I think all would entertain for education of the

blind person and for their rehabilitation.

Blind children and blind youth are not as such peculiar. What is common to them is the fact that they are blind. No other personality traits, no personality traits are inherently accompaniments of blindness.

Consequently, a group of blind children and blind youth, unlike some of the other groups with which you are concerned, do not indicate any peculiar kinds of interest or capacity or talent or taste.

They are, except for the fact that they are blind, random cross sec-

tion of the population of children and youth.

The objective, therefore, of educating them and the aim of rehabilitating them is not an objective which is devoted to making them acquire some particular kind of interest or for satisfying some particular kind of need. In educating them, the problem is through ways different from those employed for sighted children and youth to enable them to realize their peculiar interests and talents and capacities and the job of rehabilitating them is of enabling them in different ways to do exactly what normal, that is to say, sighted persons, do; namely, earn their own living.

I should like to emphasize that the objective, then, of educating and rehabilitating is simply to enable blind children and youth to do everything that anybody else can do, although they must do them often in

different ways.

Secondly, I should like to mention two needs which I think, in the light of this kind of objective, we may properly regard as presently not thoroughly met. In order to teach children and youth who are blind, books must be available to them. The chief source of books available to blind college students and one of the important sources of books available to blind children below that level is the Library of Congress Division for the Blind.

The Library of Congress Division for the Blind makes available books in sound media, voice recordings, that is, and in braille, both

press braille and hand-copied braille books.

At the present time, I imagine among other things for lack of financial support, the collection of books in the Library of Congress is not representative of the world's literature. Neither representative of the world's descriptive literature, the kinds of books that are required in courses in the social sciences and the natural sciences, nor is it representative of the world's imaginative literature—of novels, poetry, drama, and the like.

I would suggest that the committee might like to consider the possibility of increasing the appropriation for the Library of Congress with the specific purpose of enabling it to make a more representative

collection.

At the present time the books in the collection are chiefly of an entertainment sort. That is not entirely true, but it is roughly true.

Mr. Elliott. How many separate titles do we have?

Mr. Price. I could not tell you. They have a considerable number, but I am not in a position to say.

However, this does introduce the second remark that I wanted to

make about the Library of Congress collection.

At present there is no comprehensive catalog of the books which the Library does contain in sound media, in voice recording, and in braille.

It is no doubt a very considerable task to make such a catalog, but I would remind the members of the committee that the users of the Division for the Blind, Library of Congress, are located all over the country. The books are distributed through regional libraries, though they are part of the collection of the Library of Congress, so that those who use it cannot come to the Library of Congress Division for the Blind and look through the card catalog to see what is there.

If there were a catalog available and kept up to date by regular supplements, the blind students throughout the country would find the holdings of the Library enormously more accessible and they would be able to make much better use of the collection than it is now

possible to do.

There are no doubt considerable difficulties in making such a catalog, but I would suggest to the committee that legislation, if that be necessary, or an appropriation destined for that purpose, be considered.

Very briefly, I should like to mention a third inadequacy of the collection, which is not so much an inadequacy really, as a way in which it could be improved, which it does not at present endeavor even.

There are a large number of aspects of the world which are at present inaccessible to the blind, but in which we are interested and the improvement for which they might very well be talented.

I have in mind, first, the architectural and sculptural monuments, which are a regular part of the education of the sighted children.

At present there are no models of these which the blind child can examine.

It would be enormously helpful if some research could be started which would consider the problem of making available three-dimentional models of important piece of architecture, such as, for example, St. Peters, as the White House, and the Guggenheimer Museum, and, indeed, as the building in which we are now sitting.

If models of such things were available to blind children, they would learn a great deal which at present words, which is all that is available to them, cannot possibly describe for them.

It would also develop a lot of talents which now go unnoticed.

Research on that might be helpful.

May I take one more minute, Mr. Chairman?

Mr. Elliott. Yes, sir.

Mr. Price. The other unmet need that I wanted to mention is this: I think that those who are busy with the administration of programs for the blind very easily, with the best of intentions and the most human of motives, very easily find themselves pushed into an attitude which is not the most helpful, although it is extremely difficult to avoid.

They are dealing with people who are blind and to whom they have to give special ways of doing things. It becomes very easy for administrators of educational programs and rehabilitation programs to develop rules, to develop tests, to develop general principles, according to which blind clients and blind students are measured and predicted

and understood.

This is no doubt a useful procedure, but I think there is a great danger that administrators, being extremely busy people, would rely upon it too much. I think with blind persons, as with all persons, there is a great amount of talent and interest which can neither be adequately measured and ascertained by tests now available nor predicted with any great degree of reliability.

I would like to suggest that this difficulty, which is almost inherent in administration, might be very much lessened if there were legislation encouraging educators, educational administrators, and rehabilitation persons and bureaus to consult with mature blind persons upon their problems and upon the manner in which they can be solved.

The need for consultation of blind persons is the second need which I think at present goes unmet. I am sure I have taken up my 10

minutes.

Mr. Elliott. Thank you very much, Dr. Price.

I recognize the gentleman from Minnesota, Mr. Quie.

Mr. Quie. Dr. Price, you are quite familiar with the facilities that the Library of Congress provides. Do you feel that where these regional libraries now exist they have sufficient buildings or area to house the present talking books?

Mr. PRICE. I think, sir, that there is probably a very considerable problem on that score. I have heard complaints about it from various

sources

I am not in an authoritative position to answer your question, but I certainly have heard a great deal of complaint on that score.

People want to give services, but there really are problems, and

staff I imagine, too.

Mr. Quie. Secondly, on those models so that children in the schools can get a feel of the architecture and other objects, can you cite any schools that have done a good job of providing that themselves?

Mr. Price. There used to be some of this material available. I think that it was not much used. At any rate, the blind persons with whom I am acquainted, which is a very large number, none of them, I think, would be willing to boast even a rudimentary knowledge of

the important monuments of architecture or sculpture. It is perhaps partly difficulty of getting teachers to use these materials.

That was some time ago when they were available. I think at

present there are very few of these materials.

Mr. Elliott. I recognize the gentleman from New Jersey, Mr.

Mr. Daniels. Dr. Price, as to your first recommendation, have you given any consideration as to the cost of reproducing in braille for the benefit of the blind people literature of a better reading quality? Have you conducted a survey of any kind?

Mr. Price. You mean of a better physical quality?

Mr. Daniels. Yes.

Mr. PRICE. No; I think, however, that the braille, and also the recordings which are presently available to the Library of Congress, are excellent. Technically, they do a marvelous job.

Mr. Daniels. Could you furnish this committee with any information as to the cost of reproduction in braille of the type of literature

that you are recommending to this committee?

Mr. Price. I cannot give you any very sensible notion on that score; no, sir. It may be that my colleague, Mr. Nagel, of the National Federation of the Blind, who is present, does have such information.

Mr. Daniels. Thank you.

Mr. Elliott. Thank you very much, Dr. Price, for your fine testimonv.

STATEMENT OF DR. KINGSLEY PRICE

Mr. Chairman and members of the subcommittee, I would like to tell you something about myself because this information will make my later remarks more intelligible. I am an associate professor in philosophy and education at the Johns Hopkins University. I never have held a position in work for the blind and do not expect to do so in the future. I am a teacher of philosophy, including philosophy of education. I write on philosophical topics, and, at least to some degree, am a scholar of the literature of philosophy. I expect to spend the rest of my life doing these things. I have no professional stake in any kind of program of work for the blind.

Nonetheless, I have, since my college days, felt a warm interest in the prob-lime of the blind and have spent part of my spare time working with organizations of the blind to bring about a solution of their problems. At present, I am a member of the Advisory Committee on Book Selection of the Division for the Blind of the Library of Congress. I am also a member of the board of directors of the National Federation of the Blind. Today, I represent the

National Federation of the Blind in these hearings.

I would like, first, to make some general remarks concerning the aims and objectives of education and rehabilitation of the blind; and, secondly, to set forth briefly two kinds of needs of blind persons which are now not adequately

met by programs for their education and rehabilitation.

1. First, the aims and objectives of educating and rehabilitating blind persons are not, in their nature, different from those of the education and rehabilitation of any other group. Blindness carries with it no other traits. Consequently, blind children and adults are characterized by no other property than that of blindness. They are no more like one another than would be the children and adults of any randomly chosen group—no more like one another, that is, except for their deficiency of vision. It follows that the capacities and interests, the talents and the tastes of blind children and adults are of no peculiar sort, and that they range over as wide an area as do those of sighted persons.

The objectives of education and of rehabilitation must be understood in terms of the capacities and interests, the talents and the tastes of those to be educated and rehabilitated. A person is educated to the degree that he has acquired the means of exercising his capacities, realizing his interests, and developing his talents and tastes. He is rehabilitated to the degree that the

obstacles to earning his livelihood have been overcome. Since blind children and adults, as such, do not exhibit any peculiar psychological structure, there is no proper restriction on the direction which their education should assume, and almost no restriction on the kind of economic activity toward which their rehabilitation should aim. Of course, the blind cannot be rehabilitated by teaching them to be chauffers and professional baseball players. But since blindness carries with it no other physical or psychological trait, no other physical or psychological capacity or incapacity, blindness dictates no peculiar kind of education, and demands no particular type of rehabilitation. In this respect the blind differ from other groups with which this subcommittee must be concerned. Their difference lies in the fact that what characterizes them, their blindness, in no way whatever limits the kind of education they may legitimately require, and the kind of rehabilitation (with a very few obvious exceptions) for which they may properly hope. What they should learn, and what they should learn how to do by way of livelihood should be no more restricted than is that of any randomly selected group. The business of education and rehabilitation of the blind is that of enabling them to learn and to do what might be learned or done by anyone else, but to learn and to do it in a different way.

II. In the light of this objective, there are two kinds of needs from which blind children and adults suffer, and which are now not adequately satisfied.

1. First, there is the need for materials which will enable blind children and adults to become aware of what the world contains, i.e., to become aware of the contents of their cultural heritage, as well as of the physical universe. These materials are of two kinds. The first are books.

(a) The chief source of books for blind children and adults is the Division for the Blind, Library of Congress. This is not the only source. The American Printing House for the Blind makes available to the lower schools such books as its presently restrictive quota system permits. But it remains true that the Library of Congress, Division for the Blind, is the largest single source for reading materials.

reading materials for blind children and adults generally.

The holdings of the Division for the Blind, Library of Congress, consist chiefy of braille books (both machine made and hand transcribed) and of books recorded in voice media (chiefly on disks, talking book records). These books are sent to blind persons throughout the Nation, in part through the medium of State libraries and in part directly from the Library of Congress.

The holdings of the Division for the Blind, Library of Congress, are altogether inadequate to meet the educational needs of blind children and adults. They consist almost wholly of books of light entertainment. Their character is, generally, bland, escapist, and mediocre. The great imaginative and descriptive literature of the world is almost unrepresented. Serious novelists, poets, and armatists make almost no appearance on the shelves and the literature of the social and natural sciences (mathematics, physics, biology, etc.) of philosophy, theology, and the humanities generally, is almost completely absent. There is a great need for a collection of books in braille and on voice records which is representative of the world's literature; and this collection would naturally grow out of an improvement of the holdings of the Division for the Blind, Library of Congress.

I would like to suggest that the subcommittee consider legislation which would increase the appropriation for the Library of Congress, Division for the Blind, in order that its collection of braille and voice-recorded books should be made adequately representative of the world's literature; and that it consider, further, the advisability of offering an amendment to the appropriate statutes which would insure this kind of improvement of the collection held

by the Library of Congress, Division for the Blind.

(b) The second kind of materials which would be of enormous use to blind children and adults are three-dimensional models. These models would serve two uses. First, they would provide representation in three dimensions of important works of sculpture and architecture. Secondly, they would provide in an immediate form, much more effective than verbal descriptions, the nature of many physical facts, e.g., geographical structures, such as continents, islands, etc., and astronomical concepts, such as the ecliptic. At present a variety of such models are available to the sighted who have the advantage of observing both their tangible and abstract forms but the blind have no such privilege, Blind children and adults are, consequently, entirely cut off from one important dimension of life. They have no way of knowing or understanding the arts of

architecture and of sculpture. This phase of their education is almost utterly neglected. The use of models to explain geographical facts and astronomical concepts is not quite so meager but very nearly so. It would be an enormous improvement in the education of the blind if models were readily available which could bring them an acquaintance with Chartres, St. Peters, the White House, the Guggenheim Museum, or, for that matter, the building in which this subcommittee is holding these hearings; and if they could be shown what the great sculptors of the past and the present have created. Their learning of what the physical world contains would be greatly facilitated if the number and variety of relief maps and similar materials were greatly increased.

I suggest that the subcommittee consider measures which would make available to blind children and adults models of sculpture and architecture and other models helpful in showing what the world is like; and that the subcommittee consider making these materials available through the Library of Congress, Divi-

sion for the Blind, on a loan basis.

I suggest, further, that the subcommittee consider Federal support of research, the purpose of which would be to investigate the possibility of translating painting, drawing, and other kinds of two-dimensional art into three-dimensional relief. Little is known about how much can be translated from a medium which is primarily visual into one which is primarily tactual, but since it would be a great improvement in the education of the blind if they could know something about the history of two-dimensional art, this research would be very much

worth carrying on, no matter what its outcome.

(e) I should like to mention, now, a third aspect of unmet needs with respect to the Library of Congress, Division for the Blind. The materials held in the collection of the Division are used by blind children and adults who live throughout the entire Nation. Books which the Division contains are distributed through State and other libraries. The users of the collection cannot be expected to travel to the State or other distributing library, or to the Library of Congress in Washington, D.C., in order to find out what books are available to them. The blind reader cannot look through the collection of books in Braille or in voice recording which are presently available to him. Moreover, there is a considerable number of books available to blind readers in libraries which have no connection whatever with the Library of Congress, but which are available to blind readers on a nationwide basis.

I would like to suggest that the subcommittee consider taking measures which would insure the creation of a comprehensive union catalog of Braille and voice-recorded books presently held by the Library of Congress, as well as by other libraries, to which catalog regular supplements would be made with sufficient

frequency to guarantee reasonable currency.

2. The second kind of unmet need from which blind children and adults suffer is a need to be considered as individual human beings in their own right. There is a very widespread tendency among administrators of programs for the blind to regard those whose advancement their programs should further as little more than things to be manipulated in accord with the routines which they have inherited from their administrative predecessors. The blind child or adult is all too frequently thought of as something to be helped in a specified and familiar way. The administrator forgets that the subjects of his administration are persons and not simply things to be dealt with according to a certain set of rules, and according to a certain pattern of administrative behavior—that the test of those rules and that pattern is utility in advancing the proper purposes of his administration.

This failure is typified in what, as far as I can tell, is the attitude which actuates the administration of the Library of Congress, Division for the Blind. An examination of the books which are made available to blind children and adults under the aegis of this organization unavoidably suggests that those books are selected on the principle that the blind reader is something to be protected against the world rather than instructed as to its contents. Only such an attitude could explain the blandness and the medicerity which typifies the collection. This attitude, no doubt, is much the most comfortable for the administrators of a library. It encourages among the readers a lack of imagination and independence of thought, while it assures the absence from the Library shelves of any books sufficiently interesting to incur objection. What it does not do, however, is what it ought properly to endeavor—namely, to further the exercise of the right to read on the part of the blind, which right on the part of others other libraries genuinely endeavor to foster and enable.

But the Library of Congress, Division for the Blind, is by no means the only organization which, for whatever reason, succeeds in frustrating the aims of education and rehabilitation. To treat the blind child and adult as something to be helped according to uncritically accepted rules, independent of any question of their utility, is a practice widespread in the administration of education and rehabilitation programs. It is easier to treat the blind in this way since any attention to the individual and unique capacities of such children and adults requires more work and effort. This is no indictment of the motives of individual persons. It is a statement, rather, of a natural tendency of all administrative organizations. The tendency on the part of those who make them up is to simplify each part of their work in view of the time-consuming functions which they are expected to perform. Nonetheless, it must be said that the primary objective of educating and rehabilitating the blind, the objective of furthering the realization of those interests and capacities which each blind child and adult harbor is presently frustrated by administrative inertia.

The administrator's failure to further the rights and interests of blind children and adults can be greatly diminished if blind persons are consulted, from time to time, upon the efficacy of existing programs, and upon the need for new

and more imaginative policies.

I would like to recommend that the subcommittee consider legislation which would assure that those who administer programs of education and rehabilitation of the blind would, from time to time, consult representatives of the blind themselves upon the efficacy of their programs and upon ways of improvement.

III. Conclusion. The objective of educating the blind is to further the interests and capabilities, the talents and tastes of each child and adult involved, but to further no particular kind of interest or capacity, taste or talent, since no such particular one characterizes blind persons, as such. The objective of rehabilitation of the blind is that of enabling them to offset their blindness in order to earn a livelihood, but it is not to provide for them any particular kind of profession, vocation, or work since no particular kind of such capacity accompanies blindness. It follows that the objective of educating and rehabilitating the blind is simply that of fostering in them special ways of learning and doing what anyone else might learn or do, special ways, that is, of realizing their own individual selves.

The collection of the Library of Congress, Division for the Blind does not adequately assist in the realization of these objectives. The collection should be made more representative of the world's imaginative and descriptive literature, should include three-dimensional models of the world of art and nature, and should be described in a comprehensive, cumulative catalog of all the books available to the blind for their education and rehabilitation. Research should be instituted to see whether two-dimensional art might not be made accessible

to the blind.

Administrative inertia and lack of imagination also prevents the realization of the objectives of education and rehabilitation. The individuality of blind children and adults needs to be protected and its realization assured by a diminution of this inertia. A necessary part of such diminution is consultation of blind persons by those who are charged with the administration of education and rehabilitation programs for the blind.

This is the objective of education and rehabilitation of the blind; and these are two important kinds of needs which, in the light of that objective, presently

afflict the blind children and adults of this Nation.

Finally, Mr. Chairman, I wish to thank this subcommittee and the staff of its special study for the opportunity to testify here as well as serve as an invitee to the workshop on the visually impaired which concluded its deliberations yesterday afternoon, in Philadelphia. In urging a legislative mandate in favor of consultation with the blind themselves in the administration and execution of programs which bear directly upon them, the blind are simply asking that administrators of these programs afford them opportunities similar to those provided by this subcommittee and its special study staff. The advice and views of the blind should be made available to administrators of programs for their aid and rehabilitation through regularly established procedures. To fail to take this step is to reject a valuable source of experience and knowledge which could result in substantial program improvements—results which could be invaluable to administrators and the blind—those who administer the programs and those whom the programs are intended to benefit.

Mr. Elliott. Our next witness is Mrs. Audrey Spring. Mrs. Spring is the director of the North Jersey Hearing and Speech Center of Paterson, N.J.

Mrs. Spring, I am happy to recognize you. I recognize that you

more than anybody else have been patient today.

You may proceed.

STATEMENT OF MRS. AUDREY SPRING, DIRECTOR, NORTH JERSEY HEARING AND SPEECH CENTER, PATERSON, N.J.

Mrs. Spring. To those of us who are concerned with the rehabilitation of the hearing and speech impaired person, the efforts of this Subcommittee on Special Education in the field of speech pathology and audiology are deeply appreciated and are of primary importance.

Consequently, the proposed House Joint Resolution No. 494 was studied and discussed in great detail by the board of directors, the professional staff, and the parents and patients of the North Jersey

Hearing and Speech Center.

Mr. Elliott. How many people do you have at your North Jersey

Speech Center?

Mrs. Spring. We see about 60 children a week and about 20 adults a week, not counting our turnover.

Mr. Daniels. This is a voluntary organization?

Mrs. Spring. Yes; Community Chest. We are in unanimity with legislators and previous speakers in their concern with programs that exist at present and in their desire to strengthen and expand the rehabilitation facilities in this field.

However, we wonder if this resolution provides the more expeditious and effective solution to our common problem. Perhaps the Federal expenditure of \$31/2 million might be more profitably employed by improving the services to the deaf and hard of hearing and speech handicapped in a more direct manner.

The specific problem with which this resolution concerns itself is the paucity of students enrolling in the department of speech pathol-

ogy and audiology in our institutions of higher learning.

This resolution recognizes that adequate educational facilities for these students exist, but admit the inability of these programs to attract larger numbers of students and yet our colleges and universities at present are not generally suffering from lack of applicants and are in fact becoming increasingly overtaxed.

Since other departments in our universities which are functioning at maximum capacity do not always receive subsidies or offer scholarships we must accept the possibility that working conditions and employment opportunities in our field do not provide adequate interest

and incentive.

We are all cognizant of the fact that all of the students who do receive their degrees in hearing and speech fields do not continue, un-

fortunately, in these areas upon graduation.

Others remain in this field for only a short time. Still others are lost to our Federal, municipal, or community speech and hearing program centers or clinics when they elect to practice privately.

It is doubtful the subsidies or issuance of scholarships will remedy this situation. Rather, the following points are suggested as probable causes for the insufficient number of professionals employed in our

speech and hearing rehabilitation programs:

One, scarcity of adequate job opportunities in certain areas of the eastern Atlantic region. Although many hearing and speech positions remain unfilled in other areas of the region, our area, which is New Jersey, is concerned with the lack of hearing and speech facilities.

Of our school systems, many do not have any speech and hearing programs at all. Others are budgeted for only minimum programs

employing a therapist only 1 day a week.

Further, community hearing and speech centers or those connected with hospitals or rehabilitation institutes, do not maintain adequate staff. In both cases the need for expanded speech and hearing services due to the constantly increasing demands of our communities, is evident.

Two, lack of incentive to personnel.

Too often our speech and hearing programs lose desirable candidates by their inability to offer adequate salaries and opportunities for personal advancement. In addition the necessarily large number of patients each therapist or teacher must see now is not conducive to professional growth or experience.

The therapist does not have sufficient time or energy to pursue further study, attend professional meetings, or conventions, and pur-

sue activities in related fields.

These disadvantages are not the only ones that exist in our field, but are primarily important and are furthermore the most easily and effectively remedied by expenditure of public funds.

This remedy seems more feasible than the issuance of scholarships which might not result in the hoped for increase in manpower in our

field.

Therefore, it is our considered opinion that, one, colleges and universities must institute more positive recruitment programs in speech pathology and audiology and the \$3½ million now planned for subsidies to colleges and universities might be more wisely spent by strengthening and expanding present speech and hearing facilities and by creating more programs that would result in more rewarding job opportunities.

A twofold purpose might be served in that way.

Firstly, positions in the field of audiology and speech pathology would be increased and made more attractive to student candidates;

Secondly, but of equal importance, better services to the deaf and hard of hearing of our community would be possible.

Mr. Elliott. Thank you very much, Mrs. Springer.

Mrs. Springer. Thank you.

Mr. Elliott. Our next witness is Dr. Harold Scholl.

Dr. Scholl is acting chairman of the speech department and director of the speech and hearing center of Montclair State College, N.J.

STATEMENT OF DR. HAROLD M. SCHOLL, ACTING CHAIRMAN, SPEECH DEPARTMENT COORDINATOR, SPEECH AND HEARING CENTER, MONTCLAIR STATE COLLEGE, MONTCLAIR, N.J.

Dr. Scholl. Since the end of World War II, there has been increased public concern with the speech and language problems of children and adults. We have come to recognize the importance of

adequate oral communication for self-realization, vocational competency, social and emotional growth, and good citizenship.

We have failed to go much beyond the recognition stage, however, and often we become enmeshed in platitudes and philosophical

discussion.

I am sure that the convincing testimony you have received to date has made you completely sympathetic and in agreement with the

importance of speech rehabilitation.

It seems unnecessary at this point to engage in rhetorical pyrotechnics to persuade you further of the debilitating and handicapping effects of communicative disorders on the psychosocial and intellectual development of children and on the economic and personal life of young adults and senior citizens.

I doubt that anyone will argue about the value of therapeutic services, but the core of the problem lies in the lack of sufficient funds to carry out various aspects of a comprehensive program of speech ha-

bilitation and rehabilitation.

School boards cannot always find the money to make speech therapy services available to their children; adequate space and facilities for speech therapy are not always included in planning for school and rehabilitation centers since costs are critical; therapists with limited or substandard training cannot afford to go back to college for advanced training because of high tuition fees, and graduate programs cannot maintain small classes for those who do go back to school since the colleges depend on a high student to professor ratio.

We at Montclair State College are concerned with the training of undergraduate students who want to teach speech. We believe in providing a program that is broad in scope and rich in professional

laboratory experiences.

Our basic philosophy is that all children need the services of a speech specialist, ranging from an enrichment and prevention pro-

gram, to a remedial program.

We feel that a blending of the speech arts and sciences, in proper proportions, prepares a young man or woman to best meet the needs of all schoolchildren and to work successfully in enlisting the aid of classroom teachers, and the success of any speech correction program depends to a very large extent on the cooperation of the regular classroom teacher.

Training on the graduate level, however, is training in depth. Graduate students may enroll in a program leading to advanced clinical certification in speech and be prepared for the position of speech

pathologist and for supervisor of speech services.

We also maintain a demonstration speech and hearing center at the college and have an enrollment of approximately 100 children. We maintain affiliations with the Rehabilitation Department at Mountainside Hospital, and with the North Jersey Training School—for mentally retarded girls.

We provide consultation services to the schools in neighboring communities and have conducted surveys of the speech needs of 17 school

systems in New Jersey during the past 8 years.

It is within this framework of experience and interest that I should like to present some of the needs and problem areas with which we are concerned at Montclair State College.

It is estimated that 75,000 children have speech problems. Approximately 10,000 children are now receiving therapy in school programs.

New Jersey records indicate that in total there are 59 full-time and

15 part-time "teachers of the speech defective."

In order to service the remaining number, approximately 650 speech pathologists are needed for schoolchildren in regular classes and children in classes for the mentally retarded.

Out of some 600 school districts in New Jersey, only 25 employ one or more full-time teachers of speech. Of the 74 speech correctionists,

14 have only emergency endorsements.

In addition, most correction work at the moment is located in northern New Jersey. As low as the numbers are, speech correction is practically unheard of in very rural areas in the southern part of the State.

College training programs: Montclair College has State and administration support in its program for preparing students as teachers of children and adults with speech disorders. The extent of the

support, however, is financially limited.

At the present time, we have the largest number of students enrolled in the speech major of any college in New Jersey and we still cannot fill the large number of employer requests for trained speech personnel.

We need support in recruiting larger numbers of capable young people to the profession through publications, career clinics, insti-

tutes, et cetera.

Few high school students today are aware of speech rehabilitation

as a profession.

We also need to attract more men to the profession to minimize the turnover that we have because there are so many women doing special

therapy work.

With an increased student enrollment, present facilities become inadequate. Federal assistance to the State may be needed to help establish comprehensive education clinics in which many disciplines are coordinated and all future teachers and specialists may observe and participate.

In addition to inadequacy of facilities with expansion, adequate supervision becomes imperative and costly. Ideally, no student clinician should provide therapy without direct supervision. This is inconceivable in assigning the 15-semester-hour teaching load of a

college professor.

If Federal funds were available for such purposes, practicing speech pathologists could be retained on an adjunct staff appointment to help supervise the very important clinical internship experience of the college students.

At present, supervision is on the basis of five students to one supervisor, whereas we feel it should be on a one-to-one basis while the student fulfills his prescribed 200 clock hours of clinical experience.

On the graduate level, the problem of supervision also obtains.

In addition, there is the very real problem of college finances. In the State of New Jersey, graduate study at the State colleges must pay its own way. It cannot be a losing proposition since there are no State funds to subsidize the programs. Consequently, the average class size must be 22 students, and no fewer than 15. It is virtually impossible to consistently meet this

requirement in the speech major.

When a program is just getting started, numbers are bound to be low. Requirements for matriculation for the master's degree cannot be met in many instances, and we are dealing with a field in which there exists a critical shortage of personnel to begin with.

Therefore, a very respectable class size for a graduate speech pro-

gram would be between 7 and 10 students.

Unfortunately, the college cannot support this, and as a result the course is canceled and as many as 10 potential speech pathologists are denied the training they must and should have.

Federal aid to colleges instituting graduate programs would be

tremendously valuable.

We are also very much in favor of House Resolution 494 as one possible solution to this problem because it may make it possible to recruit a greater number of capable students who could not otherwise afford the tuition costs.

There is one thing I would like to bring to your attention. We are one of the few colleges in the State that have conducted surveys of the needs of communities in New Jersey. We have gone into schools at the request of the board of education and screened thousands of children to find out what the needs are in these communities.

So far we have been to 17 school systems in New Jersey and we have found that the percentage is considerably higher than the 5-percent figure which was presented on the national level. It runs somewhat

closer to 20 percent of children having severe defects.

We have used, in estimating the number of speech therapists we need in New Jersey, the 5-percent figure.

So this is a very conservative estimate.

The problem in some way may be due to the metropolitan area, to crowded conditions. Sometimes when we get into the more rural areas of New Jersey and do testing we find that there is a lower percentage of incidence of speech disorders.

We hardly ever find young people who stutter in some of the farm

areas, but we do find quite a few in the metropolitan areas.

There is a second group we are concerned with, those children who are markedly atypical, who have multidisorders. We are constantly requested to provide services at the college for these children because no services in speech and hearing are available to them at the local level.

We are also concerned with the geriatric patients with chronic diseases, such as cerebral vascular accidents, Parkinson's disease, and laryngectomy. We have just skimmed the surface in these areas and

a good deal more needs to be done.

On behalf of the members of the speech department at Montclair State College, I thank you for inviting me to present our needs and problems. We strongly urge the passage of pending legislation and hope that in the near future that our students and the speech handicapped citizens of New Jersey may be beneficiaries of your very significant proposals.

Thank you very much.

(The formal statement of Dr. Scholl follows:)

STATEMENT OF DR. HAROLD M. SCHOLL, MONTCLAIR STATE COLLEGE, UPPER MONTCLAIR, N.J.

Since the end of World War II, there has been increased public concern with the speech and language problems of children and adults. We have come to recognize the importance of adequate oral communication for self-realization, vocational competency, social and emotional growth, and good citizenship. We have failed to go much beyond the recognition stage, however, and often we become enmeshed in platitudes and philosophical discussions. I am sure that the convincing testimony you have received to date has made you completely sympathetic and in agreement with the importance of speech rehabilitation. It seems unnecessary at this point to engage in rhetorical pyrotechnics to persuade you further of the debilitating and handicapping effects of communicative disorders on the psychosocial and intellectual development of children and on the economic and personal life of young adults and senior citizens. I doubt that anyone will argue about the value of therapeutic services, but the core of the problem lies in the lack of sufficient funds to carry out various aspects of a comprehensive program of speech habilitation and rehabilitation. School boards cannot always find the money to make speech therapy services available to their children; adequate space and facilities for speech therapy are not always included in planning for school and rehabilitation centers since costs are critical; therapists with limited or substandard training cannot afford to go back to college for advanced training because of high tuition fees; and graduate programs cannot maintain small classes for those who do go back to school since the colleges depend on a high student to professor ratio.

We at Montclair State College are concerned with the training of undergraduate students who want to teach speech. We believe in providing a program that is broad in scope and rich in professional laboratory experiences. Our basic philosophy is that all children need the services of a speech specialist—ranging from an enrichment and prevention program to a remedial program. We feel that a blending of the speech arts and sciences, in proper proportions, prepares a young man or women to best meet the needs of all schoolchildren and to work successfully in enlisting the aid of classroom teachers. Training on the graduate level, however, is training-in-depth. Graduate students may enroll in a program leading to advanced clinical certification in speech and be prepared for the position of

speech pathologist and for supervisor of speech services.

We also maintain a demonstration Speech and Hearing Center at the college and have an enrollment of approximately 100 children. We maintain affiliations with the Rehabilitation Department at Mountainside Hospital and with the North Jersey Training School (for mentally retarded girls).

We provide consultation services to the schools in neighboring communities and have conducted surveys of the speech needs of 17 school systems in New Jersey

during the past 8 years.

It is within this framework of experience and interest that I should like to present some of the needs and problem areas with which we are concerned at Montclair State College.

BASIC STATISTICS IN NEW JERSEY

It is estimated that 75,000 schoolchildren have speech problems. Approximately 10,000 children are now receiving therapy in school programs.

New Jersey records indicate that in total there are 59 full-time and 15 part-

time "teachers of the speech defective."

In order to service the remaining number, approximately 650 speech pathologists are needed for schoolchildren in regular classes and children in classes for the mentally retarded.

Out of some 600 school districts in New Jersey, only 25 employ 1 or more full-time teachers of speech. Of the 74 speech correctionists, 14 have only

emergency endorsements.

In addition, most correction work at the moment is located in northern New Jersey. As low as the numbers are, speech correction is practically unheard of in very rural areas in the southern part of the State.

COLLEGE TRAINING PROGRAMS

Montclair State College has State and administration support in its program for preparing students as teachers of children and adults with speech disorders. The extent of the support, however, is financially limited. At the present time, we have the largest number of students enrolled in the speech major of any college in New Jersey and we still cannot fill the large number of employer requests for trained speech personnel.

We need support in recruiting larger numbers of capable young people to the profession through publications, career clinics, institutes, etc. Few high school students today are aware of speech rehabilitation as a profession. We also need to attract more men to the profession to minimize the turnover that we

have because there are so many women doing special therapy work.

With an increased student enrollment, present facilities become inadequate. Federal assistance to the State may be needed to help establish comprehensive education clinics in which many disciplines are coordinated and all future

teachers and specialists may observe and participate.

In addition to inadequacy of facilities with expansion, adequate supervision becomes imperative and costly. Ideally, no student clinician should provide therapy without direct supervision. This is inconceivable in assigning the 15 semester hour teaching load of a college professor. If Federal funds were available for such purposes, practicing speech pathologists could be retained on an adjunct staff appointment to help supervise the very important clinical internship experience of the college students. At present, supervision is on the basis of 5 students to 1 supervisor, whereas we feel it should be on a 1-to-1 basis while the student fulfills his prescribed 200 clock hours of clinical experience.

On the graduate level, the problem of supervision also obtains. In addition, there is the very real problem of college finances. In the State of New Jersey. graduate study at the State colleges must "pay its own way." It cannot be a losing proposition since there are no State funds to subsidize the programs. Consequently, the average class size must be 22 students, and no fewer than 15. It is virtually impossible to consistently meet this requirement in the speech major. When a program is just getting started, numbers are bound to be low. Requirements for matriculation for the master's degree cannot be met in many instances, and we are dealing with a field in which there exists a critical shortage of personnel to begin with. Therefore, a very respectable class size for a graduate speech program would be between 7 and 10 students. Unfortunately the college cannot support this, and as a result the course is canceled and as many as 10 potential speech pathologists are denied the training they must and should have. Federal aid to colleges instituting graduate programs would be tremendously valuable. We are also very much in favor of House Joint Resolution 494 as one possible solution to this problem because it may make it possible to recruit a greater number of capable students who could not otherwise afford the tuition costs.

THE SPEECH AND HEARING CENTER

Because of the shortage of trained personnel and the resulting dearth of speech programs in the schools of New Jersey, the Montclair Speech and Hearing Center has accepted over 100 students each year for free speech therapy. Free diagnostic services are also made available to approximately 200 persons each year. A minimum amount of program time has been allowed our faculty members for participation in these activities. The numbers, in proportion to personnel, are overwhelming. We are losing sight of our original purpose as a teaching and demonstration center, with service to the child in the community becoming the primary rather than secondary purpose. We are overloaded with children who have no other resource available to them in their public school or parochial school or in their community. This situation will be revised when there are a sufficient number of speech pathologists and a sufficient number of school pro-

Additional Federal funds might also make it possible to retain a supervising speech pathologist at special centers and hospitals affiliated with the college's

training program.

SURVEYS CONDUCTED BY THE SPEECH DEPARTMENT AT MONTCLAIR STATE COLLEGE

The attached report summarizes the results of surveys conducted in 17 school systems in New Jersey. In order to determine the speech needs of the children enrolled, almost 25,000 children were individually tested. The final figures may be affected by (a) the lack of standardized testing criteria. (b) the occasional listing of minor problems as major ones and (c) the limited experience of the examiners. The average percentage of children needing remedial speech therapy is a good deal higher than the 5 percent figure generally accepted for the Nation. It is our feeling, however, that the 21 percent figure is fairly reliable because of the consistency with which this incidence occurred even though there were different teams of raters on almost each survey. It is not surprising to us that the incidence of speech problems in a metropolitan, overcrowded area should be higher than the average figure based on the national picture. Parenthetically, its interesting to note that the estimated need of over 600 speech therapists is based on the 5 percent and not the 20 percent figure.

SPECIAL GROUPS

In addition to the speech-handicapped schoolchildren, there are some children and adults who invariably require speech therapy services. These persons comprise two groups:

1. The markedly atypical child with multiple disorders (mentally re-

tarded, cerebral palsied, childhood schizophrenics).

2. The geriatric patient with chronic diseases (cerebral vascular accidents,

Parkinson's disease, laryngectomy).

Research needs in these areas are great and with the rapidly increasing aged population, geriatrics will soon become the Nation's primary health problem. There is a direct relationship between chronic diseases in the aged and speech and hearing problems. Frequently, the successful vocational rehabilitation and the ability for an older person to maintain his independence and dignity depend upon the patient's ability to communicate his thoughts, wants, and needs.

With an increased population of older persons, there will be a concomitant

increase in the need for trained speech pathologists and audiologists.

Under existing legislation for hospitals and rehabilitation centers, adequate speech and hearing facilities should also be encouraged in planning treatment areas. Most of the time, speech therapy facilities are substandard even in the newest installations despite the fact that of all the therapies—physical, occupational, vocational, etc.—speech and hearing therapy has the greatest potential for supporting its own program. Federal advisers to hospitals receiving grants should encourage the allocation of space that is large enough for individual and group therapy sessions.

CONCLUSION

On behalf of the members of the speech department at Montclair State College, thank you for inviting me to elaborate our needs and problems. We strongly urge the passage of the pending legislation and hope that in the near future students and speech-handicapped citizens in New Jersey may be beneficiaries of your very significant proposals.

Mr. Elliott. Our next witness is Mr. Charles A. Abel, of the Maryland Society for Mentally Retarded Children, Inc.

Mr. Abel, we are happy to have you here. You may proceed.

STATEMENT OF CHARLES A. ABEL, LEGISLATIVE CHAIRMAN, MARYLAND SOCIETY FOR MENTALLY RETARDED CHILDREN, INC.

Mr. Abel. Thank you. Mr. Chairman and distinguished members of the committee, first I would like to thank you, the chairman, and this committee, for giving me the privilege of testifying in behalf of the mentally retarded children and young adults of the State of Maryland.

Mr. Elliott. Thank you for being so patient with us.

Mr. Abel. I will take this opportunity to present to you the facts

which exist in this area of handicapped in our State.

In the year of 1951 with the full cooperation of the State board of education and the complete understanding of our legislative members an amendment was adopted to extend school aid to severely retarded children.

I might add that in 1956 this was extended down to the preschool handicapped children. It does not encompass the normal child, but

does encompass the severely retarded child.

Some of the normal children do have preschool training in some of the counties and in Baltimore City. This mandatory legislation to our knowledge, was the first to be enacted by any State in the country pertaining to the so-called trainable retarded child.

Now, I would like to bring to your attention some positive facts which I feel relate to title II of H.R. 3465, independent living rehabili-

tation services.

In October of 1952 the Greater Baltimore chapter of the Maryland Society for Mentally Retarded Children, Inc., a parent group, initiated

a preschool training center, and there we hoped to prove that if these children started on a training program at an early age they could be advanced to a special education class with less difficulty.

Here we were also successful in obtaining the services of the supervisor to special education who counseled and lectured in parent educa-

tion.

By September of 1954, we expanded our services to include those school age mentally retarded children who could not qualify for existing special classes. In this particular situation we were handling the blind retarded and some deaf retarded.

As a result we helped to give some counseling to the Maryland School

for the Bind in handling the preschool blind retarded child.

As a result of this program we proved that these multiple handicapped children benefited from group training in small classes. After 7 years of demonstration of this project we have expanded from one class of 10 children to 10 classes of 102.

Scores of applications have been filed on our waiting lists. Of course, this does not take into account many children whose parents

have not yet applied.

Federal participation that is suggested in title II of H.R. 3465 is the only hope we can see in bringing services to those who need them so desperately. By bringing these facts to your attention we feel we have concrete evidence that if this program were not in existence, many of these children being served would likely be in an institution.

This, of course, would cost 2½ times more and would not give these

children an opportunity to develop to their fullest potential.

Of these children, many have been transferred from this training program to a special class in one of the schools made available by special education. In years to come they may be able to participate in a workshop environment and possibly find their places in private industry.

This would give them the opportunity to liquidate the investment made in this behalf and achieve status within the community to the

best of their ability.

The greatest need as we see it, is the lack of funds to expand these

services.

I might point out that this demonstration relates to the metropolitan area and without Federal funds could not possibly be extended to our

rural sections where the instances of retardation are great.

If you are not familiar with the State of Maryland, Baltimore City and Baltimore County constitute almost one-half of the population of the State. Therefore, I feel that with Federal aid we could substantially reduce the number of referrals of these children to institutions.

As we all know, maintaining an institutional program for these

individuals is far more costly.

Now, if I may, I would like to show how I was able to substantiate my statement of liquidating the investment made in these children relating to title IV of H.R. 3465, in which you propose to make available funds to set up rehabilitation and evaluation services.

On September 16, 1957, a sheltered workshop was established in the Greater Baltimore area. Here we were able to bring those young adults who had completed their training in classes of special education for the retarded. After 2 years of operation of this workshop we have been able to place in private industry 17 of these clients out

of 97 who have been served.

With the aid of contract from various manufacturing establishments all of our clients who have completed their evaluation and training periods sponsored by the Department of Vocational Rehabilitation, are participating in Federal and State taxes, as well as the social security program. Although not contributing as much as those placed in outside jobs, they swell the population of tax-paying citizens.

I will submit to you in my report our report to the Office of Vocational Rehabilitation, Department of Health, Education, and Welfare, and I would like to just take one moment to give you an idea

of the type of people that we are handling.

Just 4 years ago at a Texas convention of the National Association of Retarded Children, I was told that to the knowledge of the gentleman leading the discussion he had no knowledge at all of people who were of a trainable IQ level that was doing work in the area of private industry.

I might say that in the 17 who have been placed some of them

range in IQs down as low as 41.

Now, you will see this in the report that I am submitting to you as

our progress report.

The adoption of 3465 would give services to those who after application and evaluation could not qualify for the sheltered workshop, but who have more limited ability, would be acceptable in a center where they could be productive and retain their dignity.

In closing I would like to bring to your attention that we are not asking for the impossible. We are only requesting the rights of these mentally retarded individuals who cannot speak for themselves, but who with your help may attain a place in the community with

dignity and self-confidence.

Thank you.

Mr. Elliott. Thank you very much.

(The formal statement of Mr. Abel follows:)

STATEMENT OF CHARLES E. ABEL, LEGISLATIVE CHAIRMAN, MARYLAND SOCIETY FOR MENTALLY RETARDED CHILDREN, INC.

Mr. Chairman, distinguished members of the committee, first, I would like to thank you, the chairman and this committee, for giving me the privilege of testifying in behalf of the mentally retarded children and young adults of the State of Maryland.

I will take this opportunity to present to you the facts which exist in this area

of handicap in our State.

In the year 1951, with the full cooperation of the State Board of Education and the complete understanding of our legislative members, an amendment was adopted to extend school aid to severely retarded children.

This mandatory legislation, to our knowledge, was the first to be enacted by any State in this country, pertaining to the so-called trainable retarded child. Now, I would like to bring to your attention some positive facts which I feel

relate to title II of H.R. 3465 Independent Living Rehabilitation Services.

In October of 1952, The Greater Baltimore Chapter of the Maryland Society for Mentally Retarded Children, Inc., a parent group, initiated a preschool training center. There we hoped to prove that if these children started on a training program at an early age, they could be advanced to a special education class with less difficulty. Here, we were also successful in obtaining the services of

the supervisor of special education, who counseled and lectured in parent education.

By September of 1954, we expanded our services to include those school age mentally retarded children who could not qualify for existing special classes.

As a result of this program, we proved that these multiple handicapped chil-

dren benefited from group training in small classes.

After 7 years of demonstration of this project, we have expanded from 1 class of 10 children to 10 classes of 102. Scores of applications have been filed on our waiting list. Of course, this does not take into account the many

children, whose parents have not yet applied. Federal participation that is suggested in title II of II.R. 3465 is the only hope we can see in bringing services

to those who need them so desperately.

By bringing these facts to your attention, we feel we have concrete evidence that if this program were not in existence, many of these children being served would likely be in institutions. This placement, of course, would cost some 2½ times more, and would not give these children the opportunity to develop to their fullest notential.

Many of these children have been transferred from this training program to a special class in one of the schools made available by special education. In years to come, they may be able to participate in a workshop environment and possibly find their places in private industry. This would give them the opportunity to liquidate the investment made in their behalf and achieve status within the community to the best of their ability.

The greatest need as we see it is the lack of funds to expand these services. I might point out that this demonstration relates to a metropolitan area, and without Federal funds could not possibly be extended to our rural sections, where

the instances of retardation are great.

Therefore, I feel that with this Federal aid, we could substantially reduce the number of referrals of these children to institutions. As we all know, maintaining an institutional program for these individuals is far more costly.

Now, if I may, I would like to show how I was able to substantiate my statement of liquidating the investment made in these children, relating to title IV of H.R. 3465, in which you propose to make available funds to set up rehabilitation evaluation services.

On September 16, 1957, a sheltered workshop was established in the Greater Baltimore area. Here we were able to bring those young adults who had com-

pleted their training in classes of special education for the retarded.

After 2 years of operation of this workshop, we have been able to place in private industry 17 of these clients out of 97 who have been served. With the aid of contracts from various manufacturing establishments, all of our clients who have completed their evaluation and training periods, sponsored by the Department of Vocational Rehabilitation, are participating in Federal and State taxes, as well as the social security program. Although not contributing as much as those placed in outside jobs, they swell the population of tax paying citizens.

I submit to you, for your examination, our progress report to the Department of Health, Education, and Welfare, to substantiate the statements of this testi-

mony. This report is as of June 30, 1959.

The adoption of H.R. 3465, as I interpret the bill, would give services to those who after application and evaluation could not qualify for the sheltered workshop, but who have more limited ability would be acceptable in a center where

they could be productive and retain their dignity.

In closing, I would like to bring to your attention that we are not asking for the impossible. We are only requesting the rights of these mentally retarded individuals who cannot speak for themselves, but who with your help may attain a place in the community with dignity and self confidence.

REPORT BY SHELTERED WORKSHOP, MARYLAND SOCIETY FOR MENTALLY RETARDED CHILDREN, GREATER BALTIMORE CHAPTER, INC.

PREFACE

The first 6 months of 1959 has been a period of broadening horizons for the Occupational Training Center for the Mentally Retarded. We are progressing toward maturity and our stature is being recognized by many of the local industrial, educational, and civil groups.

We are just beginning to explore the potentials in this field, and we have great distances to cover before this sheltered workshop will acquire a firm foundation of recognition from industry and the community at large.

In my judgment, this workshop will succeed in becoming an integral facet of community planning for rehabilitation of the mentally retarded when we have demonstrated that with proper evaluation, vocational guidance, counseling, specialized placement, and followup, there is definite hope for the mentally retarded individual.

The future of the sheltered workshop and the services to clients will depend largely upon the service we give to industry and the community.

This Office of Vocational Rehabilitation project became an integral part of the division of vocational rehabilitation of the Greater Baltimore area. It has been a significant factor in the formation of the program and plays an important part in the development of a community plan for the rehabilitation of mentally retarded adults.

REQUEST FOR CONTINUATION GRANT

Section 1. Identification

Name of grantee organization: Maryland Society for Mentally Retarded Children, Greater Baltimore Chapter, Inc.

Title of project: "Occupational Training Center for the Mentally Retarded," Selected demonstration project: R.D. 373.

Section 2. Background

On September 16, 1957, the sheltered workshop for the retarded was established at 2438 Greenmount Avenue, Baltimore 18, Md., with the strong cooperative efforts of the division of vocational rehabilitation. It was set up because Maryland had no other agency to evaluate the vocational potential of the retarded, and also to provide a place for those who could not meet the requirements of outside competition.

On January 1, 1959, the Office of Vocational Rehabilitation approved a selected demonstration project grant to the sheltered workshop entitled, "Occupational Training Center for the Mentally Retarded." The purposes of this demonstration project are:

1. To provide a period of evaluation followed by transitional, as well as long-range, sheltered work experiences through the use of knowledge, methods, and techniques acquired through the Office of Vocational Rehabilitation and the prototype project in New York City.

To demonstrate the effectiveness of vocational rehabilitation services.
 To increase the employability of the retarded young adults who were

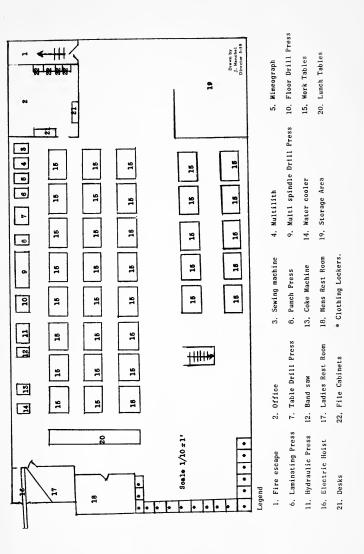

formerly considered unemployable.

4. To provide a year-round industrial environment which will permit the evaluation to work capacity, and which will develop a work personality in the retarded adult.

5. To educate the community so it will have a better understanding of the mentally retarded adult and the value of rehabilitation services.

Section 3. Referrals

The referral procedure established is that all referrals will come from the division of vocational rehabilitation.

Section 4. Intake procedure

An intake policy was established to include the work capacities of the mentally retarded regardless of concommittant disabilities:

1. No individual with an IQ over 75.

2. Seizures have to be under control.

3. No emotionally disturbed.

4. Each client is required to attend to his personal physical needs.

All trainees use public transportation except the mentally retarded severely

orthopedic who were in the workshop prior to the grant.

Prior to admission, a complete history and profile of the applicant ist obtained; psychological, vocational, and medical evaluation to determine abilities, academic achievements, social maturity, and emotional stability. The social worker visits the home and agencies to record a complete family and social history of the applicant. This gives the social worker a clear picture of the background; this

knowledge is important in advising and counseling the trainee.

Since one of the functions of the training center is to introduce acceptable habits and attitudes toward work, one of the methods used is parental counseling. With the mentally retarded who has never known independence of action or judgment, it is essential that the parent be a part of the training program. The prevailing attitude at home is a profound factor influencing the individual's capacity to accept the orientation of the training program. Therefore, an established procedure is for all parents to be seen to encourage their cooperation in bringing about any needed changes. One of the aims in working closely with parents is to enable them to feel secure in permitting their child to achieve a greater measure of independence.

For those who are rejected, possible alternate plans are explored. For those accepted, a tentative program plan outlining approaches in training and develop-

ment of vocational and social skills are formulated.

Section 5. Prevocational evaluation

Upon admission, the client is assigned to the prevocational evaluation area for a period of 6 weeks. To obtain an objective evaluation, each individual tries out many industrial tasks requiring various degrees of skill. The clients are rated on the basis of what industry requires of employees doing the same job.

As the client goes from one task to the other, comments are recorded concerning the work habits, work tolerance, social relationships, and emotional stability. Close supervision is maintained on all clients and reason for failure is noted. The purpose of this evaluation is to determine what is the maximum each individual can do; not what he cannot do. When we know what can be done, we have a point of departure for further investigation into vocational areas for possible placement into outside competitive industry.

During the 6 weeks evaluation, a client has the opportunity to manipulate tools

and machines on jobs about which he had no previous knowledge.

Counseling varies according to the needs of each client. The majority of the applicants have never held jobs before and require intensive vocational orientation and guidance. Still others, who have lived isolated and protected lives, must first learn compatability with others and gain a realistic view of their limitations and goals.

Section 6. Personal adjustment training

Personal adjustment training means the individual's ability to be trained in order to meet all the qualifications demanded for occupational employment and successful job holding. This means ability to meet the maximum physical demands, the intellectual needs and emotional reactions which are required. The trainees in the center are being processed to prepare themselves for useful employment.

When the client completes his evaluation and enters this training phase, he is taught the proper way to do his job. The training personnel are both able and willing to explain the approved method, are patient while these methods are being understood and followed. Considerable energy is devoted to the encouragement of the trainees during those periods in the learning process when little or no improvement or accomplishment seems apparent.

Since understanding is so important for learning, all trainees receive both oral instructions and actual practice. Explanations are given to help them clarify or understand the methods to be learned, and then the actual use of the learning to make the understanding complete. The final stages of understanding thus come

with actual practice.

The fact that a client does not rate high in ability to learn quickly, or that he has no special aptitude for training center jobs, does not mean that he can be left without training. Every client is given appropriate training. Trainees who stand at different levels of ability and aptitude are trained for different types of jobs. (See sec. 12, 13, and 14.)

The instruction is kept lively by being made immediately practical. It is necessary that the trainee understand basic principles if he is to be most efficient, but instruction in basic principles are kept near enough to practice for the application to be apparent. Omitted from the instruction is theory that is

irrelevant or remote.

An all-around approach is the method used by the supervisors. Every possible way of reaching the trainee's mind is used: Oral instructions, demonstrations, visual aids, and counseling. Instruction is put to immediate use by action on the job.

The supervisors are guided in developing the training program through the use of a simple formula which was developed by Dr. Charles R. Allen and Dr. Charles

R. Richards, and the U.S. Office of Education.

The form in which the formula is generally accepted and used now is:

$$E=M+T+I+J+Mo$$

E =Personal equipment needed by the individual for job success.

M = Manipulations of hands, machines, or tools, or combination of each.

T =Technical knowledge necessary to make M operative.

I =General industrial knowledge of safety, hygiene, materials, and other items which contribute to make a workman.

J =Judgment.

Mo = Morale.

Jobs of semiskilled nature are represented as follows:

$$E=M+T+I+J+Mo$$

These are highly developed, single purpose jobs which do not require much technical or general occupational knowledge. The "J" term increases with experiences and performance and eventually becomes of equal importance with "M."

PAYMENT OF TRAINEES AND WORKERS

The primary focus is on personality development and preparation for employment. The payment of the trainees is considered as a secondary factor in the workshop. The workshop has a U.S. Department of Labor approved minimum wage of 10 cents per hour for trainees and 20 cents per hour for workers.

Workers are paid according to the number of items they produce. Payment per item is gazed according to the amount a normal person in industry produces in 1 hour, at \$1 per hour. Our workers being less productive, earn proportionately less. If a worker does not earn the minimum wage, his pay is subsidized.

Sample breakdown of subcontracts for payroll

Types of contracts	Number of pieces	Number per hour	Price	Average hourly rate
Metal shoe assembly 13	163, 000	125	9.90M	0, 21
Metal shoe assembly 17	48,000	125	9, 90M	. 22

C/L band assembly 21	24,000	300	3.50M	. 20

Section 8. Population

During the first 6 months of operation, a total of 58 clients were served in the training center and the sheltered workshop; 29 clients were carried over from a previous operation of the shop; 29 new clients were admitted since January 1, 1959; 25 clients were terminated, as follows:

Community employment	9
Referred for advanced training	8
Unable to adjust	4
Family withdrew	4

All entering trainees receive the same services of prevocational evaluation, personal adjustment training, counseling, vocational guidance and community placement, or long-term training and employment in the workshop.

Auxiliary programs include weekly recreation activities at the YWCA (swimming, basketball, dancing), monthly dance and Girl Scout troop.

Section 9. Age and sex

There have been more retarded males served in the center than females; 36 or 63 percent were males, 22 or 37 percent were females.

Age	Male	Percentage	Female	Percentage	Total number	Total per- centage
16 to 17 7 to 18 8 to 19 9 to 20 00 to 21 11 to 22 22 to 23	4 9 2 3 7 3	6 16 4 5 12 5	2 4 3 3 3 4	4 6 5 5 6	6 9 6 6 10 6	10 16 10 10 17 10
23 to 24 4 to 25 55 to 26 6 to 27 Over 27	1 1 1 1 1	2 2 2 2 2 2	1 2	2 4	1 1 1 2 3	2 2 2 4
Total	36	63	22	37	58	10

Section 10. Distribution of intellectual levels

Intelligence of trainees based on IQ scores ranged from 30 to 75. For this purpose, either the full-scale Wechsler IQ, or the Stanford-Binet IQ was taken, depending which was available, reliable, and most recent.

IQ	Male	Percentage	Female	Percentage	Total number	Total percentage
30 to 34. 35 to 39. 40 to 44. 45 to 49. 50 to 54. 55 to 59. 60 to 64. 65 to 69. 70 to 75.	4 1 5 4 1 6 6 6	7 2 8 7 2 10 10	1 1 2 3 7 1 1 3	2 2 4 5 12 2 2 5	5 2 7 7 8 7 7 9	9 4 12 12 14 12 12 15
Total	36	61	22	39	58	100

Section 11. Concomitant disabilities

Concomitant disabilities found included speech problems, cerebral palsy, et cetera. The table below gives the concomitant disability, the number of trainees involved, and the percentage.

Disability	Number of clients	Percentage
Speech Epilepsy	. 34	55
Vision	12	2.
Emotionally disturbed	10	1
Orthopedic	8	1.
Cerebral palsy	5	1
Hearing	. 4	
PolioPolio	. 2	
Aphasic	. 2	
Cardiac	- 1	2
Parkinson disease	- I	1

Section 12. Placement

Placement is a function of the division of vocational rehabilitation within the program of this project. It is the responsibility of the rehabilitation counselors, in cooperation with the project director and supervisors of the project to see that the trainees of the project are placed in the labor market for which they have been prepared. The ability to place those who have participated in pre-employment training, in the jobs for which they have been trained, is the supreme test of effectiveness of the training and the acceptance of the training programs by employers.

Since January 1, 1959, nine trainees have been placed in community employ-

Type of job	Number of clients	Age	1Q
Repair shop helper	1 1	20	49
Sewing machine operator		17	50
Distributing circularsSander	4	20-22 20	55-64 59
Housecleaner		17	68
School aid		23	71

Section 13. Pending placement

Eleven trainees are in this group.

Type of job	Number of clients	Age	IQ
Dishwasher Baker's helper Janitor's helper Floor boy or lady Stripper Opaquer Flie clerk	1 2 2 3 1 1 1	18 16-20 16-20 19-23 17 17 21	41 47-75 40-64 50-59-67 63 65 67

Section 14. Referred to other agencies for training

Type of training	Number of clients	Age	IQ
Sewing machine operator	5	16-20	46-7)
Tile setter	2	17-21	58-67
Truck driver's helper	1	20	57

Section 15. Information and community education

The work of the special demonstration project has been widely publicized through speeches, publications and personal visits to professional organizations. There has been a steady stream of visitors from all parts of the country to see the project.

Speeches:

The Industrial Club of Baltimore, Md.

Division of Vocational Rehabilitation Counselors Staff Meeting.

Section 16. Plans

As a result of our observations, records and experiences during this short 6 months period, we are able to see promise of worthwhile results, and some indication of favorable paths to follow in the vocational rehabilitation of the mentally

During the period from January 1, 1960, to December 31, 1960, for which continuation grant funds are being sought, the following plans have been formulated:

1. To expand training in trade and industrial manipulative skills, which are needed for successful entrance into trade and industrial employment.

2. To expand the evaluation phase in nonmanual aims:

A. To provide those valuable developmental experiences associated with learning through doing, through sense of touch or feeling in combination with other senses.

B. To provide opportunities for significant experiences in thought and

performance through individual and group tasks.

C. To develop knowledge and appreciation of materials, products and tools

of modern industry.

3. To further study and the removal of the element of fear in the use, adjustment and repair of mechanical-electrical devices common to every day industry. 4. To further the development of work habits and attitudes which are needed for obtaining a job and also for the holding of a job.

5. To further explore the use of community resources to help create public

awareness of the mentally retardates' needs and problems, and to raise the level of civic participation. Mr. Elliott. Our next witness is Mrs. Mirian Tannhauser, State chairman of special education for the Maryland Congress of Parents

and Teachers, of Baltimore, Md. You, too, have been very patient, Mrs. Tannhauser. We bespeak

our appreciation to you.

STATEMENT OF MRS. MIRIAN TANNHAUSER, STATE CHAIRMAN, SPECIAL EDUCATION FOR THE MARYLAND CONGRESS PARENTS AND TEACHERS, OF BALTIMORE, MD.

Mrs. Tannhauser. I am State chairman of special education for the Maryland Congress of Parents and Teachers, representing over 200,000 members in 700 local communities.

Our concern is for the health, education, and welfare of all children. Today I speak to you particularly in behalf of 80,000 children in

Maryland with special needs.

The Maryland congress endorses the legislative program of the National Congress of Parents and Teachers. Copies of the national program and adopted State program for legislation are provided for your information.

I refer to item IV, page 2, of the State program to show our continuing interest in Federal aid for education. Item V on pages 2 and 3 point up specific areas of concern for children with special needs.

Pages 4, 5, and 6 of this report support needs of children in general, but are of special importance for children with special problems.

H.R. 3465, the independent living bill, and House Joint Resolution 494 training of teachers, speech pathologists, and audiologists, are in line with the interests and purposes of the Maryland Congress of Parents and Teachers. I, therefore, speak in support of these bills.

Representatives from Maryland State governmental departments will have spoken of State programs and special needs. The Maryland Congress of Parents and Teachers cooperates with these departments

by supporting the best possible services for all children.1

Support of major functions of government in Maryland is provided: Mental hygiene: local, none; State, 100 percent; Federal, none.

Highways: local, 3 percent; State, 76 percent; Federal, 21 percent. Welfare: local, 21 percent; State, 33 percent; Federal, 46 percent. Correction: local, 28 percent; State, 72 percent; Federal, none.

Health: 2 local, 33 percent; State, 55 percent; Federal, 12 percent. The 1958 per capita income in Maryland was \$2,221, thus ranking Maryland 10th among the States. The State ranked 37th, however, in per capita State expenditures for education.

We ranked 18th in estimated current expense per pupil in 1958–59. We ranked 26th in percent of revenue for public elementary and

secondary schools from State government in 1957-58.

We ranked 35th in State tax revenue as a percent of personal income payment, with only 4 percent of personal income going for State taxes.

The PTA feels that a greater portion of our Nation's tax resources at State and Federal level must be used to provide the kind of education and training which will develop our greatest resource, our

children, more effectively.3

Local school systems have traditionally and should continue to provide the major share of the responsibility and the control of education. Equalization formulas are used in many States, however, to assist local school systems. Could not such an equalization system on a broader base provide assistance from and to the Nation as a whole?

The education and training of handicapped children in a school system where the anual operating per pupil cost is \$434 for normal children, it is approximately \$1,000 for a handicapped child.

In a school system where the capital cost for each new elementary student is approximately \$1,140 and for each new secondary student \$2,400, it will cost \$3,700 per handicapped child who requires special physical facilities.

School systems in sparsely populated areas have many practical problems in trying to set up adequate special education programs.

Total pupils in public school in Maryland, kindergarten through 12th grade, 665,963;
 percent of these children will need special services—92d Annual Report of State Board of Education, 1958.
 Fiscal research bureau, 1957-58.
 Exclusive of University of Maryland Hospital.
 Maryland State Teachers Association.

Many local school systems do not have the resources to support special education. Other systems with greater wealth are confronted with school population increases of 169 percent 4 in 10 years.

The Nation cannot afford the human waste, nor can it afford to

provide for 5,160,000 5 nonproductive citizens.

In an address to the National Association for Retarded Children in 1957, Miss Mary Switzer, the Director of the Office of Vocational Rehabilitation of the Health, Education, and Welfare Department, reported that of 756 retarded people given vocational rehabilitation training in a pilot project in 1956, their combined earnings rose from \$32,100 annually to \$1,265,150 annually. This demonstrates an increase of 40 times and returned in taxable income more than the cost of the training program for the first year.

I have called attention to the interest and efforts of the Maryland Congress of Parents and Teachers in behalf of the health, education, and welfare of all children and of children with special needs in

I have cited the source of support for major functions of the government of Maryland and supported the need for increased State

and Federal aid for children with special needs.

Now, I have a specific proposal for your consideration. This proposal is in line with the policies and purposes of the Congress of Parents and Teachers, but has not yet been presented for their official consideration.

This proposal is made as a result of my professional interest after 20 years of work in this field and recent endeavors in educational

research.

I propose the establishment of a national institute of education research. At the present time the challenge to keep abreast of the new concepts concerning processes and problems of growth, maturation and brain physiology is as stimulating as it is time consuming.

Even if one could give full time to factfinding in these three areas alone, the job of interpretation and integration of the new concepts and insight into our educational philosophy would remain in insurmount-

able task.

When we add to that task the need for educators to alert themselves to the findings of the more technical disciplines such as neurophysiology, biochemistry, and neuropsychiatry, audiology, psychology, and

anatomy, most school people feel hopeless and frustrated.

A second problem exists within the field of education itself. By what means and through what channels can school systems, educators and teachers establish a clearinghouse where current educational problems and needs would be matched with existing resources on a nationwide basis.

At no time in the history of this country's educational history and philosophy has this need for pooling of up-to-the-minute information on resources and needs been so great or so urgent. Neither have the results of not having provided the necessary policies and procedures to implement an information exchange service, been so disastrous to our professional morale and educational efficiency.

Montgomery County, Md., 1950-60.
 U.S. Office of Education, Division of Exceptional Children.

Why, for example, should not school system X which plans on starting a program of emotionally disturbed children next fall, not be able to write to an educational clearinghouse and receive an accumulative file reporting on educational programs for emotionally disturbed children, thus being able to profit by the experience of other school systems and avoid, at least the major mistakes they have made.

Mortimer J. Adler, in a recent report, while not referring directly to this specific problem, does describe what he feels is essential if we, as a nation, are to cease being a country which fails to honor knowl-

edge.

We need he says—

to reorganize and reorient our whole system; to educate our teachers as few are now educated; to invent materials and techniques of teaching which do not now exist, and to devise graded courses of study which are designed to do for every level of ability exactly what the traditional liberal curriculum once did effectively (during colonial times) for the few and most gifted children.

Dr. Adler is describing what we need to do. I am suggesting that the way in which this need can be resolved is to establish on a permanent long-term basis a National Institute of Educational Research.

We need to reexamine our instructional technique and our concept of how to help these children learn which our investment in medical

research have saved.

Is it not important now that we have made life and health for hundreds of thousands of additional children that we not invest in finding how to make that life worthwhile to them?

Federal legislation and appropriation during these recent years have encouraged educational research and the training of personnel for

leadership positions.

I cite, however, that many public school systems have been deterred from actual research by the lack of personnel and facilities in the universities and State departments to head the educational research.

I am also concerned that the scholarships in our State which are afforded to the State board of education have not even been requested because those persons who would profit and for whom they were intended cannot afford to give up their positions for \$2,000 a year.

Federal legislation has helped. We ask that you consider a National Institute of Educational Research as another step, as a centralizing and organizing means, stemming from some of the things

we are doing.

Experiments in education could be correlated with medical findings at national level, at the very time that the medical investigation is

determining how this child brain or body works.

New techniques which are needed, new machines, new methods, new materials, could be tested. Research fellowships could be provided to give opportunities for personnel from these State departments and universities to work out local problems, to learn research techniques, to try out the effectiveness of equipment, before it is reproduced in the various States.

Internships then could be available in all the centers where research would be done more effectively as a result of this training period in

a National Institute of Educational Research.

Standards of excellency in all education could be tried, tested, and

proven

Education and training to the maximum development of the potentiality and social usefulness for all children, regardless of race, creed, or ability, is the thing we all believe in, but have never provided for.

Can we not strengthen the hope, the integrity, and the future of our Nation through a National Institute of Educational Research, which would demonstrate that our Nation does honor education and provides for its development.

Thank you.

Mr. Elliott. Thank you very much, Mrs. Tannhauser, for your statement.

(Document attached to Mrs. Tannhauser's statement follows:)

PROGRAM OF MARYLAND CONGRESS OF PARENTS AND TEACHERS

This program is set up in two sections: "We actively support" and "We endorse," plus a few recommendations to the State board of education and to county councils.

EDUCATION MUST PRECEDE, ACCOMPANY, AND FOLLOW LEGISLATION IF ANY IS

TO SUCCEED

This we believe:

"All we want for children and youth has its roots in the moral and spiritual values we cherish. We hear a great deal about standards of living, but what we want for our children—and what they want for themselves—is a standard of values. Today, as at no other time in history, we feel the need for this sturdy morality and firm spiritual strength.

"No social invention however ingenious, no improvements in government structure however prudent, no enactment of statutes and ordinances however lofty their aims, can produce a good and secure society if personal integrity, honesty, and self-discipline are lacking" (from "Moral and Spiritual Education in Home, School and Community," by the National Congress of Parents and

Teachers).

PROGRAM FOR LEGISLATION

We actively support:

I. IMPROVEMENT OF TEACHER TRAINING

A. In State-supported teachers' colleges .-

 Adequate salaries for faculties: We urge that the Governor adopt the salary scale fixed by the State board of education in accordance with the provision of

article No. 77, public school laws of Maryland.

We urge PTA local units, councils, and all citizens interested in public education to communicate to the Governor the urgency for elevating salary scales for teachers in State-supported teachers' colleges to levels deemed adequate by the State board of education and comparable to those of other public institutions of higher learning in the State.

2. Expansion of facilities: For the last 5 to 7 years the legislative appropriations have been less than half of the amount recommended by the State board of education as being urgent to meet the greatly increasing needs. Therefore, we urge the Governor and Maryland General Assembly during its 1960 session to provide the full appropriation of \$8,556,500 as requested by the State board of education. These funds would permit the continuation of the current program pending the final adoption of the proposed long-range building program of which this is a part.

B. College of Education, University of Maryland.—Adequate financial support should be provided, with particular emphasis on new building facilities, to meet the needs of the rapidly expanding enrollments of both graduate and under-

graduate students.

C. Morgan State College.—An appropriation sufficient to meet the tremendous need here for increased faculty salaries for the teacher education program.

D. Scholarships.—We commend the Maryland General Assembly for authorizing (by House Joint Resolution 6) the appointment of a special commission to study the whole scholarship program. We further commend this commission for their diligent study and efforts in developing a plan which accomplishes the charge of the general assembly. We are extremely disturbed at the action of the legislative council, which on November 4, 1959, voted to defer action until 1961. In view of the fact that this is the fifth study in 39 years without a thorough revision of the hodgepodge method of awarding State scholarships, we strongly urge the general assembly to enact a law in the 1960 session which provides to the State and the recipients the maximum benefits and usefulness of moneys appropriated for this purpose.

II. BETTER QUALITY OF EDUCATION

A. Teachers' salaries.—To attain continuing improvement in the quality of education it is necessary that teachers be compensated adequately. We propose a State minimum-salary scale of \$4,000 to \$6,000 for all teachers holding at least a bachelor's degree, a State minimum-salary scale of \$3,800 to \$5,800 for all teachers holding a regular first grade or higher certificate, and a State minimum-salary scale of \$3,500 to \$5,400 for all teachers holding a nondegree emergency certificate, to be provided by the general assembly at its 1960 session. These scales are the same as we proposed previously, and are urgently needed now.

Note.—The delegate body at the 1959 convention passed a motion voicing its opposition to the inadequacy of the report issued by the James committee on taxation and fiscal matters, and further urged each delegate to inform his legislators of his opposition to the report and to reaffirm support of the above position

regarding teachers' salaries.

III. ACHIEVEMENT OF ADEQUATE LIBRARY SERVICES

A. Establishment of public libraries and bookmobiles in the several counties in Maryland where such services are not now provided and the improvement and expansion of others so that every citizen in every county may have free access to good reading and information, and guidance in its use. We urge State and county responsibility for financing public library buildings. The year beginning July 1, 1960, will be the last year to receive an establishment grant, \$12,000-\$20,000, under the Maryland plan for use of the Library Services Act fund.

B. Establishment of a Graduate Library School in Maryland which will grant a master's degree in library science, in order to provide certified librarians for

the public, school, college, and institution libraries of the State.

IV, FEDERAL AID FOR EDUCATION

A. Endorsement of the National Congress of Parents and Teachers program of legislation.

B. Annual renewal of certain established Federal programs:

 Federally impacted areas: We oppose any change in the present formula for impacted areas aid and urge full appropriation of the amounts presently authorized.

2. School hot-lunch program: The continued appropriation of necessary funds for this sound and essential educational and welfare program.

3. Extend library services: The full appropriation of \$7,500,000 as provided in the Library Services Act of 1956 for this terminal legislation.

C. We urge the general assembly to enact whatever appropriation is necessary for Maryland to take full advantage of the National Defense Education Act of 1958 (Public Law 864).

V. MEASURES FOR JUVENILE PROTECTION

A. Classes for emotionally disturbed children: State aid in the same manner as now provided for the physically handicapped.

B. Increased funds for mental health services, including hygiene clinics:

1. Increased State and local funds for the promotion of community mental
health services and mental hygiene clinics and the necessary supporting preventive and medical treatment services throughout the State. These noninstitutional mental health services should be immediately expanded, not only to meet
the backlog of demand from schools, but also to deal effectively with the growing

trend to treat mental patients, outside institutions, in their own communities;

and we support the expansion of services.

2. Expansion of services at Rosewood Training School: The acceptance of the proposed program of the State department of mental hygiene for the development of extended care and services for the mentally deficient and the emotionally disturbed children at this school. Further, we recommend the inclusion of the trainable child to a greater extent in the education program at Rosewood, and the improvement and expansion of the entire education program.

C. Adequate appropriations for the bureau of child welfare, of the State

department of public welfare:

- 1. Detention services: We favor continued support for adequate detention facilities and services for juveniles and entirely separate from adults and separate from State training schools whose facilities are for rehabilitation and training.
- 2. Probation services: Adequate probation services for all juveniles needing such help and provided by fully qualified and trained probation officers, in accordance with minimum standards recommended by the State department of public welfare and the National Parole and Probation Association.

3. See other items listed in supporting data.

VI. BOARDS OF EDUCATION

We consider the composition of local boards of education and the methods of appointment or nomination to be of great importance and of statewide significance, and therefore urge PTA councils and local units to take the initiative (where board members are appointed) for calling countywide nominating conventions which would recommend only qualified and interested persons for such positions. (Request recommended procedures for this.)

Note.—The following item was recommitted to committee, by convention

body, November 5, 1959, for study and rewording:

Safety-Driver education

We recognize the importance of driver education and its relation to safety on our highways, but we also recognize that it can interfere with the already overcrowded academic program and likewise it absorbs the already short supply of available teachers. Therefore, we recommend its implementation during other than regular academic class time.

We endorse and support such action or bills as might be introduced to achieve the following objectives, providing they are not in conflict with established PTA

objectives and policies:

EDUCATION

I. CONTINUATION OF EQUALIZATION PRINCIPLE IN MARYLAND'S PUBLIC SCHOOLS

Maryland law provides that every child within the State shall be entitled to a minimum program of education regardless of where the child lives and regardless of where the wealth of the State lies. The State guarantees the minimum educational opportunities for its children with equal financial effort on the part of its political subdivisions.

A. We recommend that State financing of school operating costs which has fallen from 42 percent to a recent level of 35.6 percent be restored to approximate

the national average of 45 percent.

B. The ratios of assessments to actual cash values used by the several counties and the city of Baltimore in all State-aid programs should be as closely comparable as possible. We call upon the Governor and the legislature to continue to take such joint and individual action as is necessary to achieve this purpose.

II. SCHOOL BUILDINGS

A. We reaffirm our stand that the incentive fund should be continued and increased.

B. The allocation of additional contributions should be based upon the increase in enrollments—the additional pupils for whom schools are needed.

III. TITLE TO SCHOOL PROPERTY, CONTRACT APPROVAL, AND PURCHASE OF SITES

We oppose any local bills which would transfer the title of school properties now vested in the county boards of education to county commissioners or other local governing bodies. This applies also to approval of contracts for new school buildings, and purchase of sites. We believe that our present State and county boards of education with their vested powers serve as safeguards in keeping our schools out of partisan politics.

IV, SCHOOL SYSTEM

A. State aid should be extended to include kindergartens as well as junior colleges, and adult education should be recognized as an integral part of the system.

B. Reduction of class size to a more reasonable and educable size, in both elementary and high schools, as a means of improving the quality of education and the morale of teachers. We believe no class in elementary school should consist of more than 25 pupils, as recommended at 1958 Maryland Conference on Education.

C. Guidance and counseling: We believe guidance counselors should be employed to serve children in elementary schools as well as in secondary schools, and that the ratio of pupils to counselor in secondary schools be reduced from the present State average of 660 pupils to 1 counselor, to at most 300 pupils to 1

counselor (as recommended at Maryland Conference on Education).

D. School librarians and dietitians: We urge that qualified elementary school librarians be employed and that State aid be made available for their salaries as additional school personnel. Likewise, that qualified school dietitians be employed as rapidly as possible and made regular members of the professional staff of the schools.

JUVENILE PROTECTION

I. Adequate appropriations for the Bureau of Child Welfare, a division of the State Department of Public Welfare, so that it can continue and implement its program.

II. Juvenile courts: All juvenile courts established at the circuit court level

and staffed with qualified personnel.

III. Child placement: The strengthening of present laws and adoption of others to safeguard children in cases of placement, adoption, foster care, and aid to dependent children, with appropriations to protect their living standards and provide proper services to their families; and to find a sufficient number of suitable foster homes.

IV. Standard requirements for day-care centers.

V. Narcotic control: We demand continuing adequate legislation for vigilant control of narcotics and for more stringent punishment for distributors and peddlers.

VI. The control of sex deviates, perverts, and child molesters: We demand that convicted sex deviates, perverts, and child molesters not be paroled until they have had positive treatment at a State institution set up for the rehabilitation of such persons, and in the opinion of the court, they have been adjudged by competent professional authority to be not likely to repeat this type of offense.

Note.—The following item was recommitted to committee, by convention

body, November 5, 1959, for study and rewording:

Pornographic materials, etc.: We urge the maximum penalties for persons found guilty of possessing, producing, showing, or selling obscene photographs, slides, films, literature, or other such materials. (Request NCPT report on this.)

HEALTH

I. DENTAL HYGIENE PROGRAM

A. We recommend that the Maryland State and Baltimore City Departments of Health and the health departments of the 23 counties increase their dental services to children by providing more funds for dental clinics where children unable to obtain private services may receive the necessary care.

B. We recommend that county councils and local units urge that the addition of fluoride to public water supplies to bring the fluoride concentration up to one part per million be instituted at the earliest time possible by public-water-supply authorities.

II. MIGRANT FAMILIES

We urge local PTA's and councils, in areas where migrant workers are employed, to cooperate with local and State authorities to deal with any attendant problems of health, education, safety, or welfare.

III. NURSING SERVICES

We recommend that State aid be provided to counties on a matching basis for nursing services in the public schools.

IV. SCHOOL PSYCHOLOGISTS AND PSYCHIATRISTS

We recommend county and State appropriations in order that the county boards of education employ psychologists and psychiatrists to work in cooperation with the county health departments (see also p. 3, V-B).

SAFETY

I. DRIVER LICENSES

We urge that steps be taken as rapidly as possible to assure that holders of operators' licenses for motor vehicles are entirely competent and physically fit, and that periodic examinations be required.

II. SCHOOL BUS LAWS

A. We urge the State legislature to amend section 233, article 661/2 of the motor vehicle code that requires erection of signs at the State line giving a résumé of the schoolbus laws to include a requirement for similar signs at frequent intervals on those portions of all National and State highways traveled by schoolbuses.

We further urge the Maryland State Roads Commission to request such funds as are necessary from the State legislature for the erection of more schoolbus law signs, said signs to be erected at reasonable and frequent intervals on National and State routes.

B. We urge the State department of education and the State department of motor vehicles to adopt and enforce a uniform rule for the marking of all schoolbuses to include the "minimum penalty for violation of the schoolbus law" and to reevaluate the present rules and markings.

RECOMMENDATIONS TO STATE BOARD OF EDUCATION

1. Recognizing that there is nothing so important as a qualified and competent teacher in every classroom, we call upon the State board of education to eliminate "emergency certificates" as soon as, in its opinion, a sufficient number of qualified teachers are available; and that each teacher now teaching under such a certificate be required to take courses in major subjects each year (until becoming certified) in order to be retained in the State school system.

We look with disfavor on the trend, though small, of employing teachers

with 2 years of college or less.

2. We recommend that State aid be made available for employing county

school health coordinators (supervisors of health education).

3. We urge that every effort be made to recruit fully qualified teachers for every field in which they teach, and to transfer as rapidly as possible those assigned to teach in subject fields other than those for which they were especially trained.

RECOMMENDATIONS TO COUNTY COUNCILS (AND TO LOCAL UNITS)

In addition to items listed in the legislative program

1. If your county does not have a county library established by law-work toward that goal! If your county population is small and resources are limited, cooperate with one or more adjoining counties. This year is your last chance to get your establishment grant (Library Services Act fund). (Contact our MCPT library services chairman for help.)

2. Make special plans to encourage all families to secure polio immunization voluntarily and perhaps help prevent a serious outbreak. Remember that 98 million Americans still have not had a single shot of the Salk vaccine! Cooperate with county health departments in sponsoring and operating volunteer clinics, especially for preschool-age children, the school age, and adults. (Contact our health chairman.)

3 Work with the Governor's newly established commission to assist families of migrants employed in Maryland, especially with the programs for prevention and control of tuberculosis and syphilis, being carried out this summer. Cooperate with the Council of Churches and other groups to establish programs to meet the basic health, education, welfare, and spiritual needs of these under-

privileged families and especially of the children.

4. "Unhidden persuaders": Radio, television, movies, comics, pornographic materials, etc. (the "unlicensed teachers"). We feel that what we need is enforcement of existing laws regarding obscenities instead of new legislation; we oppose censorship in principle as an infringement upon our cherished freedoms of speech, choice, and of intellectual curiosity; and feel that parents should teach children by precept and example discrimination and appreciation. the PTA guide for evaluation of radio, TV, and comics; the report on pornography: and the mouthly TV and movie guide in the National Parent-Teacher magazine.)

5. What services are available in your county or community and are they adequate? Does the PTA membership know about them? For example: recreation facilities, youth organizations, medical and dental clinics and services, school nurses, or nurses aids, library services, how juvenile delinquents are handled, detained, tried, rehabilitated? School accident insurance? Scholar-

ships? Job opportunities?

6. Do you know how many known physically and mentally handicapped or emotionally disturbed children are residing in your county? What is being

done for them? Is it sufficient?

7. Check to determine exactly how many high school students dropped out before graduation and why? Is the community concerned about high school party practices, car ownership, marriages, pregnancies, drinking, allowances, optimum use of time in school, homework, reporting system, requirements for graduation, or the like? Is there a "teenage code" of behavior? (Consult our MCPT chairman of high school service and request copies of codes, etc.)

8. Survey your high school's graduates to determine their progress in colleges, their academic weaknesses and assets? The percentage who went into armed services, to junior colleges, to work, further study? The number who did not

go for financial reasons?

9. Have you studied your county government; how your schools are financed; composition, policies, and caliber of members of your board of education; proposed and pending legislation; school curricula; how long-range planning for schools involves serious consideration of countywide planning and zoning, etc.? (Are you organized for quick action on any legislation, item, or bill? Do you have a telephone brigade?)

10. What about the safety of your children? Have you determined the existing law, and extent of enforcement, in respect to unleashed dogs? Schoolbus Fire drills? Bicycle regulations? Advise children regarding such hazards as discarded refrigerators, child molesters, swimming holes, guns and

firearms, plastic bags, etc.?

11. Check "Looking Into Your School," and the new PTA action program, "Strengthening the Home-Source of our Nation's Greatness" for additional ideas.

For Further Information:

(a) Follow up the dropouts and graduates of your high school by a study of last 3-5 years, and get copies of recent studies made by our State department of education, 301 West Preston Street, Baltimore 1, Md.

(b) Request from Maryland State Teachers' Association reprints from their magazine entitled "How Reading Is Taught in Maryland Schools," "How Spelling Is Taught," etc. (5 East Read Street, Baltimore 2, Md.)

(c) Check projects listed in our own PTA publications: "Looking Into Your Schools" and our new (green) action program. Copies will be sent all PTA'srequest others from our State office, 5 East Read Street, Baltimore 2, Md.

Mr. Elliott. Our next witness is Dr. W. B. McCormack, 3 Wordsworth Drive, Hyde Park, Wilmington 8, Del.

May I say to the reporter that the program of legislation adopted by the Maryland Congress of Parents and Teachers, under date of November 5, 1959, will be made a part of the record, without objection, immediately following the testimony of Mrs. Tannhauser.

Following that, the legislative program of the National Congress

of Parents and Teachers for 1959-60.

Now, Dr. McCormack, you may proceed with your statement, sir.

STATEMENT OF DR. W. B. McCORMACK, WILMINGTON, DEL.

Dr. McCormack. I hope to change the emphasis to another area of special education which in the past has been used mostly in terms of the handicapped or retarded child, but it also applies with equal force to the talented and academically gifted.

It is my understanding that this hearing covers both areas and, accordingly, I shall restrict myself to the question of the talented and

gifted group.

In this area, as in others, there are pressing problems at State-local educational levels. These problems need solution because of their importance to our national welfare.

To begin with, there are several conclusions which I would like to

present, about which there is fairly general agreement.

1. The intellectual resources of our population are not being ade-

quately developed.

There is a large fraction of children of exceptional ability who are not learning to their capacity. This is due to many factors, the more important being lack of motivation and lack of opportunity.

For any reason, this inadequate development is a serious loss to our

national economy.

2. Science education is a critical area of instruction, being necessary both for a liberal education for all citizens, and for the direct use by all these occupations, both skilled and professional, that work with the technical products of our civilization.

The quality of this science education is not adequate in most areas.

where it even exists.

These two conclusions sum up the bulk of the problems relating to the education of the academically talented and gifted. Without motivation by social forces, or identification by selection processes of those who are not self-starters, many of these children do not make use of the opportunities that are available.

And most commonly the opportunities available are insufficient to challenge these able children, or provide them with sufficient scope of

material.

All too frequently they sink into apathy, produce an average per-

formance, and are lost to our country irrevocably.

This insufficiency in opportunity is most notable in science education. The geometrically swelling output of knowledge of the last 50 to 100 years has not been incorporated into the training of teachers, in the curriculums offered, and especially in the thinking of our people.

Yet these areas relating to science form a new humanities subject, of vital importance to our everyday living, to the jobs of most of us in indirect ways, to our national economy, and even to our national

survival.

It is here that the lack of both challenge and opportunity in most of our public schools is most critical for the talented and gifted.

The recommendations I have to make come from my direct observations of the school system in Delaware, and from materials written about other parts of the country. These are six in number, and cover proposed activities of the Office of Education, and relations with the local or State school system:

1. The Office of Education should undertake curriculum planning and course structure work in the science-math areas in the elementary schools.

This could be much like what they and the National Science Founda-

tion are now doing at the secondary school level.

The child's attitude is fairly firmly fixed by his experiences in early grades. To my knowledge the only national program underway now at the elementary level is basically bibliographic in nature.

There is need for a program that will present fundamental concepts of the physical sciences, such as Newton's laws, number theory, fluid

and wave behavior, in interesting and understandable form.

Biology, natural history, and conservation are in good shape where they are used, since the fundamental subject matter has been more stable with time. Even with these upgrading would be desirable.

Beyond subject areas is the problem of teaching students how to use their minds most effectively, for creativity, logic, self-evaluation,

abstraction, and other aspects of mental discipline.

2. A basic problem is retraining of elementary teaching staff. Many of these have no liking for or understanding of physical science,

especially for fundamental concepts.

At the secondary school level this problem is being handled by the summer seminars run by the National Science Foundation. Such special training is now federally encouraged or subsidized for teachers of the handicapped and retarded.

We need to extend this into the elementary teacher level as a

standard program.

3. The identification of the gifted and talented, beyond those who happen to identify themselves by good marks in a good school, is far

from being under control.

Yet there are perhaps half of the academically able who never appear on the surface to have ability. These should be found in the elementary grades. A commonly suggested auxiliary is a national achievement test program, or national adoption of one of the test programs already in existence. There are four national ones used in this field.

4. Once the gifted and talented child has been found a program to

fit his learning ability must be available.

In many schools the supervisory attention or staff interest in this problem has been sadly lacking. They are busy enough with their

class problems.

The methods spoken of are classroom enrichment in heterogeneous groups, partial homogeneous grouping in selected subject areas, and multiple-track programs with relatively homogeneous groups. This should mean smaller classes for the gifted and talented, of 12 to 20 students, rather than the 25 to 40 usual class size.

For a school to work out special programs normally means the development of additional program material and provision of special supervision. There needs to be an encouragement to do this, beyond simply having a worked-out program available at the Office of Edu-

cation, or elsewhere.

One possibility is a matching fund proposition, much as is done for vocational education, for the additional costs.

5. A more severe problem, and one having the greatest financial cost,

is that of supplying the extra teachers for the smaller classes.

Many school districts right now are aiming at overall larger classes as a means of saving money with our increasing pupil loads. There are pressures in my own State Legislature in Delaware aimed in this direction. No more shortsighted policy, with disastrous potential effects in student intellectual development and motivation, could be imagined.

One possible counter to this trend, to encourage smaller classes for the gifted and talented, would be a Federal subsidy. Although this is another case of what should be an unnecessary approach to the Federal Treasury, I see no other immediate solution to this financing

problem.

The change of opinion by unenlightened school board members and local elected officials, is a slow, almost infinitesimal process, and will

not give quick results.

With suitable, intellectual standards set up for subsidy qualifications, such a class of 15 pupils could draw perhaps \$2,000 to subsidize a teacher.

With perhaps some 100,000 such classes potentially formable in the country, this is a \$200 million price tag. An equivalent approach is now used to educate the handicapped and retarded, by special classes of reduced size, and extra money allotments.

To my mind, the academically talented and gifted are certainly of

equal importance.

6. Related to this class size question is another serious problem of scattered schools, especially in rural, small town, or some suburban areas.

It is often impossible to find more than a few able students in a given school district. This problem may be soluble only by a subsidized bus transportation program for these pupils, for at least 1 or 2 days a week. By such transportation enough could be gathered together to justify a special class program.

The resource of the talented and academically gifted is one of the most precious we have as a nation. It should not be wasted by relying

on our present laissez-faire methods.

I feel that Federal action in this area would have a marked stimulatory effect on our whole educational system.

Mr. Elliott. Thank you, Doctor, very much.

Our next witness is Mr. Phillip Walsh, of the National Recreation Association. Mr. Walsh,

STATEMENT OF PHILLIP WALSH, NATIONAL RECREATION ASSOCIATION

Mr. Walsh. Thank you.

I am here as a representative of the National Recreation Association, more specifically, of its consulting service on the aged, ill, and handicapped.

The National Recreation Association is a nonprofit organization which provides direct service, consultation, research, and demonstra-

tion in all areas of recreation. Our section is devoted to recreation

as a therapy, a part of the total rehabilitation process.

We are interested in this bill because recreation therapy is often an important part of rehabilitation and because we are convinced of the great need in our field for the help this bill can provide.

I want to tell you about the role we play in rehabilitation and what

are some of the needs in our field.

Recreation therapy is, simply, the use of any recreational activity to aid in the recovery of a patient. It is recognized by the American Medical Association, the American Psychiatric Association, and the American Hospital Association, as being an integral part of the total rehabilitation program.

The important of recreation therapy has been greatly emphasized by

Drs. Howard Rusk and Carl Menninger.

States are beginning to provide for it through legislation; California and New York have made recreation mandatory for their nurs-

ing homes and homes for the aged.

New Jersey, Maryland, Delaware, and Pennsylvania, are currently considering the engagement of recreation consultants to aid in this area.

The Department of Health, Education, and Welfare has shown interest in this work and is presently supporting two studies for us.

To illustrate the role of recreation therapy, some examples may be drawn from the work we have been doing in this State, in Sussex County. This is a study by the National Recreation Association, with the help of the Sloan Foundation, to see if the needs of rural areas can be met through the use of volunteers, in a coordinated program.

We have been working in three types of institutions, a general hos-

pital, a welfare home, and several nursing homes.

One of our patients in the hospital had been doing very active, out-door work when an injury caused a paralysis. His work was important. It had involved a great deal of training and study. Paralysis made it no longer possible for him. He was depressed, bitter; he was certainly not receptive to vocational training.

At his doctor's request, recreation therapy is largely prescribed; we started involving him in simple, passive activities—movies, entertain-

ments, and the like.

He began to respond. A volunteer then introduced him to painting and, to his surprise as well as that of the volunteer teaching him, he showed a rather remarkable talent. He painted several pictures and then made frames for them as Christmas presents.

Through this, he gained some confidence in himself. Instead of withdrawing further and further from contact with others, he was drawn into contact and is now ready to learn to be self-supporting

through vocational rehabilitation.

Here the first step was a recreation activity.

Another patient, at one of the nursing homes, was afflicted by arthritis of her hand. For the most part she didn't exercise it. We started her working with clay and, after gaining greater use of the hand through this, simple loomwork was introduced. These activities provided the necessary exercise in which she had formerly been uninterested.

At the welfare home, there were patients whom the director thought perhaps incapable of participation in any activity. For the most part, they refused to move. It took time, but given a recreation program they began to use wheelchairs, walkers, and even their own power to attend the bingo sessions, parties, and other group activities.

So often in institutions it seems that the patients' families have put them in, and they sit there, waiting for God to take them out. Here recreation can bring them a reason to live their life even if

they cannot make a living.

These examples are the kind of thing that recreation does. Now as

to the present position in our field:

Here in New Jersey, the situation is fairly typical of the rest of the country. In the hospitals, the veterans hospitals have good recreational programs. The mental hospitals have programs, but not enough money to run them well. The other hospitals, with the exception of two, have no recreation programs.

In the nursing homes, the situation in the nursing homes has, within the last 6 months, become much better than in other States due, largely, to our demonstration projects. Of 125 nursing homes, 31 have insti-

tuted full- or part-time recreation programs.

In the homes, homebound patients are uncounted, their needs are not known, and there are no facilities for recreation services to them.

In our Sussex County project, we're about at the end of this study. We know we've convinced the owners and administrators of the institutions involved of the value of this kind of program. We've tried to find a way, through a volunteer council, in which it can be financed. Whether or not this will be the answer here, or in similar areas, we don't know yet.

We do know that many answers need to be found for all of the

country.

Senator McNamara has conducted an investigation into the institutionalized and stated, and I quote him:

A storage bin philosophy under which patients who could be restored to active life are condemned to needless invalidism still prevails in spirit or in fact, in most nursing homes. The needs of the patients are not met, for instance, there is a total lack of recreation activities.

There are 25,000 nursing homes and homes for the aged in the United States. The Department of Health, Education, and Welfare, made a study of these in 1955, and there was so little evidence of any type of activities for their patients that the Department could not come up with any pertinent statistic whatsoever.

Provision is generally made in ursing homes for adequate nursing, dietary care, and absolute fire protection; but less than 1 percent of the 25,000 homes gave their patients more than bed and bored—

b-o-r-e-d.

The hospital situation is better. A National Recreation Association study of recreation in hospitals, shows that of our 7,000 hospitals, 2,000 have departments of recreation therapy, and since there are, the larger hospitals—city and VA—which can afford them, they service 62 percent of the total number of beds, more than half, a much better situation than that of the nursing homes. But still, there are a lot of people in the remaining unserviced hospitals.

In the home, I cannot give you any figures on the homebound. I don't know if anyone can. We do know that there are thousands

of severely disabled people who are not in institutions.

Some Government attention has been directed to those homebound who are ready to receive vocational training and placement, and very recent consideration has been given to recreation activities you might want to call it social rehabilitation—to bring about this readiness. However, very little is known of the extent and needs of these homebound.

Our office is currently working for the Office of Vocational Rehabili-

tation in two areas related to them.

One, studying the need for recreation consultation concerning patients in sheltered workshops and demonstrating methods to meet this need.

The other study, a study to determine the psychosocial needs of a large group of homebound and a demonstration to both show and

document how these needs can best be met.

As another investigation into the homebound situation, we are planning a pilot project in Sussex County—a similar one to the one we have been doing there for the institutionalized.

In general, though, the recreational needs of the homebound have

hardly been touched.

In any of the studies I have mentioned, another great lack has been evident. It is that of qualified personnel, and while we find far too little being done with recreation in nursing homes, in hospitals, and for the homebound, we also find that in the hospitals which do try to provide it, there are, today, over 2,000 well paid positions for recreation therapists going unfilled because of the lack of trained workers to fill them.

Even in our office at the National Recreation Association, whenever a study or project is approached, the first question to be answered is:

Who can we get to do it?

Funds available for recruitment and for scholarships in our field: Actual studies as to the most effective ways of using recreation therapists in the processes of total rehabilitation are needed.

We need to get to the homebound, to find out what they need, to

provide activity centers and other services for them.

These are some of the areas in which the Federal Government can

and should help.

We are rather proud of what our section of the National Recreation Association has been able to do to further rehabilitation, but we are constantly made aware of the tremendous amount of work to be done and have always recognized that we cannot hope to do it all unaided.

The Vocational Rehabilitation Act is the kind of legislation we

feel is needed.

Thank you.

Mr. Elliott. Thank you very much, Mr. Walsh.

The next witness is Miss Elizabeth Titsworth, assistant superintendent of the New Jersey School for the Deaf at West Trenton, N.J.

Miss Titsworth testified earlier today, as a representative of the workshop from the hearing handicapped group or section of that workshop, and when you have finished we will have heard 35 witnesses today, one following the other.

May I also, before Miss Titsworth begins her testimony, say that the committee cannot but be impressed by the fine coverage that the U.S. press and Hudson Dispatch have shown us as their representative, Mr. Calter and Miss Schnieder have listened to the same 35 witnesses that we have.

You may proceed, Miss Titsworth.

STATEMENT OF ELIZABETH TITSWORTH, ASSISTANT SUPERINTENDENT, NEW JERSEY SCHOOL FOR THE DEAF, WEST TRENTON, N.J.

Miss Titsworth. Mr. Elliott, may I just give the highlights, with the details to be included in the report that I handed in?

Mr. Elliott. Yes, ma'am.

Miss Titsworth. Inasmuch as our students do come from all the counties in the State, I felt it was necessary to treat that separately.

There is a serious shortage of teachers. In 1950 our staff was made up entirely of trained teachers. This past year our staff is made up of 50 percent trained teachers.

Mr. Elliott. How many students at the New Jersey School for

the Deaf?

Miss Titsworth. 360 students.

Mr. Elliott. The training of your staff of teachers has, from the standpoint of the degree of attainments, at least in the professional

training, has deteriorated 50 percent in 10 years?

Miss Titsworth. Yes. The conditions behind this are that in 1950 we had predominantly an older staff and upon retirement we have not been able to replace with trained teachers and our enrollment has increased and once again we have not been able to hire trained teachers in the new positions that have been opened up.

In regard to increased enrollment our present enrollment is 360. We will graduate 16 this year and our waiting list is 51, which indicates an increased enrollment of 10 percent next year, which is quite

in the pattern of the past 2 years.

Mr. Elliott. How much has your enrollment increased in the last

10 years?

Miss Titsworth. I am sorry; I don't have the enrollment at that

date, Mr. Elliott.

In regard to the shortage of clinic facilities, we feel that very badly, but realize that inasmuch as New Jersey has no medical school affiliated with the university, and that is the usual development for such clinics, we are at a disadvantage and feel that if one could be made available in the State it would be of great help to the students and to the hard of hearing who are not in classes for the deaf, too.

We would recommend that the granting of scholarships to qualified people who wish to train as teachers of the deaf, the expanding of present training centers. We have set up an emergency training center with Trenton State College and since 1956, 49 have been enrolled.

At present 23 of these persons are on our staff, 8 of them in the first year of training, 8 in the second year of training, and 7 have completed training.

There has been a dropout of 10 which is 20 percent.

If the teachers could be relieved of the responsibility of carrying a classload during the year of study I feel sure we would not have the

dropout that is found in this breakdown.

In conclusion I would like to say the conditions for the future look worse than better for we are not adding new personnel, but just training those that are in the field already and deaf children into independent constructive persons who fit into society and are good citizens.

Many deaf children are being denied the help that they need. Financial help would definitely improve this condition. Thank you.

Mr. Elliott. Thank you very much, Miss Titsworth. (The formal statement of Miss Titsworth follows:)

FORMAL STATEMENT OF ELIZABETH F. TITSWORTH, ASSISTANT SUPERINTENDENT, NEW JERSEY SCHOOL FOR THE DEAF

Existing problems that developed during the war years and the years that have followed:

I. Serious shortage of trained teachers and allied personnel.

II. Increase enrollment.

III. Increase in number of deaf children multiply handicapped.

IV. Shortage of clinic facilities.

V. No educational research. Conditions related to above problems:

I. Teacher and personnel shortage

A. Academic instructors-New Jersey School for the Deaf:

	Total num- ber	Trained	Untrained
1960-51 1961-52 1962-53 1962-53 1963-54 1964-55 1965-56 1966-57 1967-58	33 33 33 31 31 35 37 36 40	33 27 25 23 21 23 21 19	(6

Note,-Over 50 percent of staff untrained in 1959

B. Conditions behind 1950's 50-percent untrained staff:

1. 1950 staff predominately an older staff and no trained replacements available for teachers who retired.

2. Increased enrollment necessitated increasing size of staff. No trained teachers available.

3. Circumstances that discourage 1 year of graduate study:

(a) Satisfactory employment available in other fields without further study.

(b) Tuition costs are between \$1,000 and \$2,000, depending upon the college or university.

4. Teacher salary scale is the same as public school and lower than salaries of high-paying communities in northern area of the State.

5. People generally locate in work within a 30-mile area of their home.

C. Additional staff needed for teacher-training program and supervision.

II. Increased enrollment

A. More deaf children:

1959-60 data:

Present enrollment	360
Graduates, June 1960	16
Present waiting list	51

Ten-percent increase in enrollment, September 1960.

B. Lowering of entrance age to age 4.

III. Increased incidence of multiple-handicapped deaf

A. Cerebral-palsy, deaf children with language disorders, crippled and mentally retarded are included in present enrollment. These children must be placed in classes of six and seven.

B. Research programs do not exist regarding the best methods of teaching

multiple handicapped.

IV. Shortage of clinic facilities

New Jersey's lack of medical schools affiliated with universities has left the State without the normal situation under which such clinics develop.

V. No educational research

A. Shortage of staff.

. .

B. Lack of clinic facilities.

SUGGESTED PROGRAM CORRECTING PROBLEMS

- Granting scholarships to qualified persons who wish to train as teachers of the deaf
- II. Expand present training centers
 - A. Status of in-service training program—New Jersey School for the Deaf: 1. Established in 1956, two-year program; 49 enrolled between 1956 and 1959. Breakdown of above 49:

On teaching staff	23
-	
In 1st year of training	8
In 2d year of training	8
Completed training	7
	=
Enrolled as a refresher course	9
Teaching elsewhere	7
Did not complete training	10
	_
Total	49

2. This program needs expanding, stabilizing, and financial support:

(1) At present no new teachers are being prepared for future demand. All enrolled are on the teaching staff.

(2) Present program dependent on two members of Lexington School for the

Deaf as instructors, three members of own staff and volunteer services.

(3) Salaries paid instructors are lower than salaries paid for same services

at other training centers.

(4) Require 18 of our teachers to be on campus from 8:30 a.m. to 6 p.m., 2 days per week.

B. Majority of existing training centers are equipped to take increased enrollment.

CONCLUSION

Conditions for the future look worse rather than better.

We are not adding new personnel to the field.

Deaf children develop into independent constructive persons who fit into society and are good citizens. Many deaf children are being denied the help they need. Financial help would definitely improve this condition.

Thank you for the opportunity to present these problems.

Mr. Elliott. Now, I call the Reverend John P. Hourihan, of the Apostolate for the Deaf, Newark, N.J.

Did I pronounce your name correctly, Dr. Hourihan?

I am happy to have you and happy that we can accommodate your desire to be heard here now.

I will be very regretful when 10 minutes from now I give you the signal.

STATEMENT OF FATHER JOHN P. HOURIHAN, APOSTOLATE FOR THE DEAF, NEWARK, N.J.

Father Hourihan. I hope I can get my Ph. D. as easily as you just called me.

The problems of children and adults who are deaf or hard of hearing are unappreciated, if not greatly misunderstood by the general public. There are several reasons for this.

First, there is a hidden handicap. Because these children do not

appear physically handicapped their cause does not have the dramatic impact upon the public as do some of the others.

Secondly, the parents of these children are not as strongly organized nor have they learned how to capitalize on public relation

methods as have some other parent groups.

This may be due to the fact that during the early years of their child's life they nourished the hope that he will be as normal as other children and do not feel the need to band together with other parents of handicapped children.

Three, in adults it is a social handicap with which there is associated a certain stigma which makes them want to withdraw from

social intercourse and often induces psychological problems.

Such people are not inclined to organize or lobby as are adults suffering from physical handicaps that evoke more sympathy from society.

It appears, however, that the situation is gradually changing due to the dedicated efforts of politicians, educators, and rehabilitation

workers.

More influence than any other will be the role of this committee who, by giving so much of your time and effort to the consideration of the unmet needs in the area of education and rehabilitation of the deaf and hard of hearing will focus the spotlight of Government interest on this problem and thereby impress the public with the idea that a hearing loss is a community loss and deserving of as much attention as any other more dramatic handicap.

Therefore, I consider it an honor to appear before this committee,

a privilege to be of assistance to you in your work.

Having worked with the deaf at Gallaudet College in Washington, D.C., having been in association with members of the Department of Health, Education, and Welfare, being a trainee, teacher in training at the Lexington School for the Deaf in New York City and directing speech and hearing programs in the diocese of Newark, I feel in a small way qualified to give testimony.

In regard to the Framton study group, we wish to state that we wholeheartedly endorse their studies and are working with them.

In regard to Mr. Elliott's bill, H.R. 494, we wish to state that we heartily approve the idea that Federal grants in aid for scholarship be given to students who wish to become teachers of the deaf, speech therapists, audiologists, to relieve a critical situation which exists in the area of education of the deaf and hard of hearing.

In regard to my own personal opinion as to what are the unmet needs in this area we wish to inform you there are many. These unmet needs cut across the total area of our population, preschool, school age, adults, and senior citizens who suffer hearing losses that

come with old age.

In all these groups with whom I have come in contact in New Jersey, I have found unmet needs that I am sure will interest your committee.

In general these needs may be summarized as men, money, and

facilities.

In particular, there is need to educate the public about the necessity for early diagnosis so that children who are acoustically handicapped can be placed in proper programs.

Among educators it is felt that if these children can be placed in a special nursery or preschool program they will then receive help that will give them the foundation for future educational programs.

There is also a need for more such special preschool programs. Related to this is the need to establish parent guidance programs in order to educate the parents of the various aspects of the handicapped, himself, so that they can develop proper emotional attitudes toward the child and his handicap.

Such programs should begin early in the life of the child so that during the very impressionable period of his life he will receive the

necessary emotional support from his parents.

Also, there is a need for more speech and hearing clinics to work with the medical profession for these children when they are dis-

covered.

With regard to the school age children, there is an urgent need for more trained teachers of the deaf and hard of hearing to work with the children in special classes and special schools, whether public, private, or parochial.

I have a personal as well as a professional interest in such teachers because during the past 8 years I have been working with 150 students from teacher training programs. In those years I was able to encourage only four to enter training programs on a graduate level.

However, if there had been scholarships to defray the cost of such programs, I believe there would have been 10 times that number.

The establishment of new teacher training programs as well as the expansion of existing programs at the university level is a need related to this area, too. Such action would then increase the number of qualified personnel at the university level which would also turn its attention to carrying on much needed research programs.

For the adults there is need for more social workers and psychol-

ogists and orientation in the problems of the deaf.

In November the Office of Vocational Rehabilitation conducted a workshop on the psychological assessment of the deaf, and here the psychologists admitted this is a relatively unexplored area.

If the Office of Vocational Rehabilitation were given an increased budget on a Federal and State level we could take on other similar

projects.

For our senior deaf citizens, there is need for expanded social, recreational, and cultural programs conducted by a staff competent to deal with the deaf.

It also would be beneficial to explore the need for homes for the

aged deaf

In conclusion I wish to state that I deliberately avoided burdening you with statistics because I know that others have massed very impressive figures. I come before you as a representative of the deaf and to speak in their name.

Thank you and may God bless you in your herculean undertaking. Mr. Elliott. Thank you very much, Father Hourihan.

Our next witness is Mr. E. B. Whitten, who must get away by 5

o'clock.

Mr. Whitten is the executive director of the National Rehabilitation Association, headquartered at Washington, D.C.

We who have known Mr. Whitten through these years recognize him as being a very outstanding and devoted scholar and worker in

this field.

May I say to you, Mr. Whitten, that we are very happy to have you.

It is up to you now to make that plane.

STATEMENT OF E. B. WHITTEN, EXECUTIVE DIRECTOR, NATIONAL REHABILITATION ASSOCIATION, WASHINGTON, D.C.

Mr. Whitten. Mr. Chairman, you won't have to caution me at all. Let me say, first Mr. Chairman, and I, too, like Mr. Page, was seeking some dramatic way to attract the attention of the public to rehabilitation. He seemed to challenge this committee to find such a method.

Since it is not likely that Mr. Flemming will be able to repeat the cranberry episode, I suggest that we ask him to prepare a training manual during the next few months which might get the desired results that we want.

As you people know, the National Rehabilitation Association is the original sponsor of H.R. 3465, which is one of the bills upon which you have been asking and receiving a great deal of testimony.

Since this has become one of the chief topics of conversation at the workshops and hearings, I thought probably it was about time that we showed up at one of these regional workshops to say a few words about just how we came to propose this type of legislation, which is becoming so popular and behind which now I think you might say almost the concerted rehabilitation movement is standing.

Incidentally, when you have your roundup hearings in Washington, we shall ask your permission to appear before the committee to give very detailed testimony on the bill, itself, and the details of it which will be necessary, of course, in the technical sense, but today we want to talk really about why we came to choose this approach toward

meeting certain needs of the handicapped.

We think these needs and particularly with reference to the adult program which I am going to talk about first can be summarized in

two or three different areas.

In the first place, evaluation of rehabilitation potential is absolutely essential to a good job in rehabilitation. We feel that probably the weakest aspect of the State-Federal program of rehabilitation now and probably this is likewise true of almost all children's programs, is that there is an inadequate evaluation of rehabilitation potential at the beginning.

This is frequently an expensive and time-consuming process and the agencies at the present time are not geared by practice, philosophy, or by legal authority, to carry on the type of evaluation work that is needed if we are to know, as we begin serving an individual, what his potentialities are.

Now, the second need that we have found is that one which has

been emphasized here many times today.

We know that there are hundreds of thousands, even millions of people in this country, who are being denied the benefits of rehabilitation because they are being adjudged to be not feasible for vocational rehabilitation.

This is not just a matter now of talking and wild gestures. The old age and survivor's insurance cash benefits program alone has identified more than 800,000 individuals who are said to be not eligible for benefits because they are capable of some substantial gainful employment, it is thought, but who are found to be not feasible for vocational rehabilitation under existing laws.

Now, these are people for whom the names and addresses are

available.

So this is not something out of the air. This is only one of the

evidences of this tremendous need.

Now, the third need is for a well-rounded program of rehabilitation facilities. Under the Hill-Burton Act it is possible now to build a limited number of what are called comprehensive rehabilitation centers, so called because they must have medical, psychological, social, and vocational aspects.

It is not possible under existing legislation to build workshops such as have been described here today, or many of the specialized rehabilitation facilities that are absolutely necessary if the job is to be done

which many people have indicated today ought to be done.

Therefore, in H.R. 3465, which is frequently called the independent living rehabilitation bill, we have provided really a complete program. No one title will stand by itself.

Independent living bill is one title, but the facilities bill and the evaluation titles are equally important and are badly needed if the

objectives of the first are to be attained.

Therefore, although naturally one group may be more interested in facilities than they are in independent living, another group more in independent living than they are in facilities, and while some may emphasize evaluation services more than others, actually we think you ought to consider this measure in the broader aspect as meeting the total need.

It is not that we could not make progress to some degree with less than a total bill, but it is all needed in some well-rounded program. That is why we came up with this after several years of intensive

study of needs in this country.

Now, a few words about training. We as much as any other organization recognize the need of trained personnel. We have really a good start being made in the Office of Vocational Rehabilitation now under the 1954 legislation.

However, examination should be made of the wording of that authority to be sure whether it is broad enough to enable the Office of Vocational Rehabilitation to do a complete and adequate training job in the area for which they have responsibility.

There are some, for instance, who think this does not.

Now, we are supporting this bill, H.R. 494, to train teachers for the deaf and speech and hearing pathologies, and audiologies, but in doing so we want to say this is not the preferred way we would like

to see this job done.

Although we recognize the need of advancing upon the categorical fronts and we have frequently come out and supported categorical legislation, we believe that the soundest basis would be to establish in the Office of Education a training program with broad authority to deal in all the areas of disability whether they are named or not—maybe you would want to name certain areas there—and to let the Office of Education try to advance the training needs for rehabilitation personnel in the schools on as near as possible a common and unified front as the Office of Educational Rehabilitation is now attempting to do in the area of adult rehabilitation.

That, to me, in our association, representing, as we do, rehabilitation people in all the programs and not concerned with any one category of the disabled, but all of them, we feel that probably will be the

soundest approach to make.

Mr. Charman, there are a great many things I could say about this legislation as you know. In fact, when I get started I find it difficult to start even for the 10-minute limitation, and a plane I am about to catch, but I believe I will pause at this time. I don't think I have taken up quite all my time, so if there is a question that someone wants to ask, I will try to answer it.

Mr. Elliott. We have been studying H.R. 3465 here for about a year. Do you have recommendations on draftsmanship with respect

to the language of that bill?

If so, I would like to have you submit them within the next 60 days. Mr. Whitten. Mr. Chairman, we have already been thinking along that line. We, ourselves, have found, I am sure, 15 or 20 places in the bill where we think language can be clarified and we have such pre-

pared and ready to submit to the committee.

You see, we have always taken the position about this legislation that our responsibility was to direct the attention of the American people and the Congress to this great need. We have never taken the position that any one bill with any particular language was the only way to do this job. As this bill has been discussed over the country, privately and in groups like this, many fine suggestions have been received that we think will improve the legislation.

Mr. Elliott. Do you know of any other bill of this nature that has

had more thorough discussion than this one is undergoing?

Mr. Whitten. No, sir; I do not. In fact, when you started these hearings, I don't mind saying I was a little bit concerned. I was afraid it was going to be a delaying process in getting something done.

Now I feel very keenly that this kind of process was necessary and there is a much better understanding of this bill and its objectives in the country now than there possibly could have been if we had not had this fine series of hearings and workshops which your committee is conducting. So we are very happy about the whole thing, but we don't want any more delay than is absolutely necessary.

Mr. Elliott. We were very successful, as you know, in conducting nationwide hearings on the school needs before we passed the National

Defense Education Act. I cannot help but feel—I do feel very strongly—that a piece of legislation to be understood has to be dramatized in the precincts where people live.

I think if we were supermen and could hold these hearings all over the country and if the people all over the country could understand

what the needs are, we could pass this bill, or a better bill.

Mr. Whitten. The growing understanding of the people, as evidenced in these hearings, has been remarkable. There has been a

better understanding of it now than I realized there was.

It is quite revealing to me to read what happens in other workshops and come here today and see organization after organization with which we have had no direct contact at all who have taken the opportunity to study this legislation and evaluate it in terms of their own local situations and have come up with the idea that this would be a big advance to help them with their programs.

In other words, I think the rehabilitation movement is more unified today than I have seen it in the 12 years I have been on this job, unified in favor of a program which almost everyone can agree will help, although they may not agree exactly on details of how it ought

to be done

Mr. Elliott. Thank you very much, Mr. Whitten.

Mr. Quie. Mr. Whitten, you gave a wonderful presentation and I

am greatly impressed by it.

It just occurs to me that there is one area that you have not brought out that undoubtedly you have done a lot of studying on, and that is the prevention of people becoming handicapped. Do you think that this is an avenue that should be studied, and do you think that we are doing an adequate job of seeing that the people don't become handicapped?

Mr. Whitten. No, we are not. We have seriously considered in our organization whether we ought to present or, at least, call the attention of this committee to some of the particular needs at the time

this bill is considered in the roundup hearings.

For instance, we think there must be a timelag of at least 5 years between the time when, for instance, we find out how a problem ought to be attacked medically with respect to some disability and the time that the hospitals and other institutions of the country actually adopt this practice.

For instance, I am told that if I had a stroke, apoplexy, I believe they call it, if I had a stroke, which is more likely to happen to me than any other disability at my age, that in the Washington area there are probably only two hospitals where the most modern methods of treating strokes will be found at this time, which almost makes a person wonder whether he ought not to carry a tag around his neck saying in case I have a stroke please send me to a certain hospital or to a certain physician.

I think there is a tremendous need there in getting into our chronic illness hospitals and our general hospitals and trying to put on demonstration projects that will help to bring about more quickly the application of the knowledge which we possess now in considerable

degree.

I also think there are great weaknesses in children's programs that need to be corrected

You will notice there is one paragraph in my statement about that. I don't think that crippled service in this country has developed nearly so rapidly as the vocational rehabilitation program has.

That ordinarily is not in the purview of your committee, being handled by the other committees of the House and Senate, but I really feel it is an obligation of this committee to make some study of this,

too, and to present to this committee some of your findings.

I think we could vastly strengthen our crippled children's services in this country. That is fundamental to any good and complete program of rehabilitation. That is the kind of prevention I think you have in mind.

There is a real need there. We are certainly anxious to cooperate

in finding ways to meet it.

Mr. Quie. I think you are in a position to give great leadership in that.

Mr. Whitten. We have been having conferences with people in the American Public Health Association, American Public Welfare Association, and in the proper bureaus of the Government, along this line.

It has been more difficult, however, for people in some branches of Government to come out with specific findings that they can agree upon in that field than it has for us in rehabilitation.

I think a much more cohesive working together may be more effective than in some other areas, but there is a great need and you can make a great contribution by exploring it.

Mr. Elliott. Thank you very much, Mr. Whitten.

Before we get back to the workshop reports, I have one other witness who must get away. That is Mr. Albert Venutolo, president of the Jersey City Hearing Society of Jersey City.

After Mr. Venutolo testifies, we will return then to the workshop

reports.

Mr. Venutolo, you may proceed.

STATEMENT OF ALBERT VENUTOLO, PRESIDENT, JERSEY CITY HEARING SOCIETY, AFFILIATE OF AMERICAN HEARING SOCIETY, JERSEY CITY, N.J.

Mr. Venutolo. At this time, Mr. Chairman, may I offer my written statement for the official record.

Mr. Elliorr. The written statement of Mr. Venutolo will be made a part of the record after his oral presentation, without objection.

Mr. Venutolo. My name is Albert Venutolo, president of the Jer-

sey City Hearing Society.

At this time, Mr. Elliott and your colleagues, in behalf of the Jersey City Hearing Society, we wish to thank you for affording us the opportunity to appear before this hard working committee.

Mr. Elliott. I am sure the gentleman knows that it would be our desire to hear everybody at greater length, but we have about 30

witnesses today and about 30 tomorrow.

Mr. Venutolo. Believe me, Mr. Elliott, I am going to make it short.

Mr. Elliott. No, I am not saying that. You have your time. But what I am saying to you is that I wish it were possible for us to do a

more thorough job.

Mr. Venutolo. I feel personally that the American Hearing Society and the American Speech & Hearing Association has presented testimony adequately enough whereby your committee has been given a general picture of the problem of the deaf and hard of hearing.

I would like to confine myself to the testimony, the geographical location of Hudson County pertaining to the problems of the deaf and

the hard of hearing.

Hudson County with a population of 700,000 people, with an incidence of roughly 5 to 6 percent, we have about 45,000 people that are deaf and hard of hearing. That includes all ages.

Mr. Elliott. You have how many?

Mr. Venutolo. About 45,000 of all ages, Mr. Elliott.

Mr. Elliott. That would be 1 in 15, would it not?

Mr. Venutolo. Roughly.

The Jersey City Hearing Society has been in existence since 1920 and we have always devoted efforts toward helping the deaf and the

hard of hearing.

To date, based on the opinion of experts, a community with 50,000 or more, they claim you should have at least 1 speech and hearing clinic with 1 qualified audiologist and 1 speech pathologist.

Mr. Elliott. To each 50,000 people?

Mr. VENUTOLO. That is right.

To this date, Hudson County has none, has no speech and hearing clinic whereby individuals, regardless of age, that have the impairment of hearing or are totally deaf, where they can be completely diagnosed and evaluated.

Of course, the Hearing Society has been working feverishly toward this end. In fact, in my testimony I have a formal presentment of a possible establishment of a hearing clinic, the Jersey City Hearing

Center, as far as back in 1958.

To shorten my testimony I will proceed along the age group un-

der the general heading of special education.

In considering the preschool child of Hudson County, we have roughly 50,000 taken at a 0.5 percent incidence, which would give about 250.

This, I say, is ultraconservative.
Mr. Elliott. What does that mean?

Mr. Venutolo. 250 children of preschool age. In other words, you have 50,000 preschool children in the country. Then we take a 0.5 incidence, which is a conservative incidence, which will give us approximately 250 children.

Mr. Elliott. Would that be deaf, or both?

Mr. Venutolo. Deaf and hard of hearing. I am making my incidences very conservative because I want to impress upon you, gentlemen, that even with a slight incidence you can see the need for help in this particular handicap field.

For example, in Denver, Colo., they just conducted a hearing test on a population of 400,000 in Denver, 4,000 preschool children. They found that 5 percent of 4,000 children had a significant hearing im-

pairment.

To go on further, in Jersey City we have 30,000 children. Taking

the incidence of 0.5 percent, you wind up with 138.

This all leads to one thing: As far as I am concerned, in working with the deaf and hard of hearing, all ages, I feel that the preschool child has really been neglected; I mean to a point where parents have to take their children out of the county, out of the city, maybe two or three times a week, to get proper therapy or proper evaluation so that when they do get to school the case history is available for the local board of education, and to this date we have no such service in Hudson County.

As you know, from previous testimony, an early evaluation by a qualified audiologist or qualified personnel in a speech and hearing clinic with a preschool child, would be of utmost importance, because the opinion of experts is that the sooner you get that child sensitive to sound and get him speech therapy or speech reading, whatever is necessary, the easier it is going to be for the local board of

education.

At this stage of the game it is very important that the parents are also guided properly, because sometimes, in fact, I have experienced this, that parents become more of a problem than the child insofar as they are not taught to accept certain setbacks.

In other words, we cannot explain to them that time is of the essence, you will see results; we know that results will come about if

you have patience.

Now, I would like to proceed now to the school age child. The public schools of Hudson County are broken down, the public school personnel of school age, we have 70,000; parochial schools, we have 30,000.

Based upon a 0.7 percent incidence on 100,000 pupils, we have 756.

Now, I best exemplify our problem by just citing one important fact. We have one class in the county, one class in the county, that has nine children that have a severe loss of hearing, a significant loss of hearing, where the age span is anywhere from 5 to 12 years, representing four different grade levels under one teacher.

This is a physical impossibility. The children cannot receive the proper type of instruction, and all I can say here is God bless the

teachers that work with them.

It really is a problem, and I think that in this part I would like to say we really need teachers. The critical shortage is here, and it is definite.

I would like to go on now to my conclusion on the special education phase.

What is needed to help evaluate the unmet needs of the special education in the field of deaf and hard of hearing? Of course, my society officially goes on record as backing up the House Joint Resolution 494 to include Federal grants for the following.

I have heard a lot of testimony today, but I did not hear a survey that would start from birth. In other words, we get competent legislators, educators, clergymen together and try to get a coordinated ef-

fort where we can get information.

In other words, the big problem, Congressman, is that a lot of the children are not found until they are 3 or 4 years old.

Then we will go to the second phase of my conclusion, research.

High institutions of learning should deal with better methods for

teaching, including vocation which is very important.

In other words, it is not that we want the best in the teaching field that are able to learn and grasp and teach; we have to make sure that they are adapted, that they want and that they will love their work. Of course, workshop research is very important, and field study.

No. 3, we need teachers. Based on research findings, offer courses to the present and future teachers, based on research, public relations, and education in the community are named to pay the handicapped teachers more money.

Right now, as I understand, we need 500 and we have about 120.

Now, may I just sum up rehabilitation. I feel I don't have enough time here, but based on a 4 to 5 incidence in deaf and hard of hearing, Hudson County has about 45,000.

There is only one out of six cases—that is taken from the Rehabilitation Commission of New Jersey—there is one out of every six that is

getting rehabilitated.

Public Health states that 8,000 become disabled every year and I would say this personally. If the Government becomes realistic, let us be business minded about this.

It is a known fact that every dollar that is thrown into rehabilita-

tion, the Government will realize \$10 in taxes.

That I received from the Rehabilitation Commission of New Jersey report.

That concludes my statement.

Mr. Elliott. Thank you very much, Mr. Venutolo. I have two statements which have been submitted for the record. The first is a statement by Julian G. Stone, president of the New Jersev Rehabilitation Association and the second, a statement by Dr. Boyd E. Nelson, director of special education, New Jersey State Department of Education.

Without objection the statement of Mr. Venutolo, together with the Statement of Mr. Stone and Dr. Nelson, will be placed in the record

at this point.

(The statements referred to follow:)

REPORT BY THE JERSEY CITY HEARING SOCIETY

The American Hearing Society and the American Speech and Hearing Association has adequately presented testimony regarding the national problem of the deaf and hard of hearing and those people who have speech difficulties.

Testimony in this report will be confined to the geographical location of

Hudson County, N.J.

Subject matter presented in this testimony is as follows:

I. REHABILITATION

A. General presentment of problems pertaining to persons of all ages who are deaf and hard of hearing.

B. What is lacking in Hudson County, N.J. C. What is needed in Hudson County, N.J.

D. Conclusion (see green pages—proposal submitted to Jersey City Medical Center, June 1958).

II. SPECIAL EDUCATION

A. General presentment of problems pertaining to preschool and school-age deaf and hard-of-hearing children.

B. What is lacking in Hudson County, N.J., pertaining to preschool deaf and hard-of-hearing children.

C. What is lacking in Hudson County, N.J., pertaining to the school-age deaf and hard-of-hearing children.

D. Conclusion: What is needed with recommendations and suggestions for the special education for the deaf and hard of hearing of preschool and schoolage children.

I. REHABILITATION

A. History of the Jersey City Society and presentment of problem in Hudson County, N.J.

The Jersey City Hearing Society has been in existence since 1920. It is an affiliate of the American Hearing Society which has devoted and will always de-

vote its efforts toward helping the deaf and hard of hearing.

The United States has 12 million people with impaired hearing; Hudson County has approximately 45,000; Jersey City has about 2,700. Statistics presented are based on reports read from the American Hearing Society which are based on incidence only. Many people with a hearing impairment, fearing a complete social readjustment, refuse to be helped. Unfortunately, many do not realize that their hearing is impaired and usually seek help and guidance when impairment is of a very serious nature. Without proper guidance they are affected psychologically; their normal communication is unintelligible; their speech becomes incoherent; thus, they gradually recede socially from every day society and most serious of all efficiency at their daily endeavor is reduced to a degree where the employer must terminate their services. With this occurring they become a burden to society and must seek guidance for rehabilitation.

B. What is lacking

Hudson County has a population of 650,000; based on opinion of experts for every 50,000 people there should be one speech and hearing clinic. Hudson

County to date is without a speech and hearing clinic.

The Jersey City Hearing Society is the only agency in Hudson County where people might come for referral and guidance. Its services are very limited insofar as diagnostic and evaluation in workup are concerned simply because it cannot afford to pay qualified personnel. Its existence depends on an appropriation of \$2,000 per year from the United Community Fund. Pathetically to state both city and county hospitals refer some of their in and outpatients to Jersey City Hearing Society for referral and audiometric evaluation. The Jersey City Hearing Society has worked feverishly for the possible establishment of a speech and hearing clinic in both the Jersey City Medical Center and the county hospital. In each case it was reported that the necessary funds were not available.

C. What is needed

Must enact legislation whereby the State rehabilitation be given more financial aid. The following facts taken from reports submitted by the New Jersey State Rehabilitation Commission will present the picture statewide for all handicapped.

Analysis of caseload

	1955	1958	1959
Awaiting investigation at beginning of year	627	1, 885	2, 075
	2, 484	6, 432	6, 118
	619	1, 030	1, 316

This brief report shows definitely the need for more Federal financial aid for the State. In New Jersey population has been increasing to an extent that public health figures show 7,810 in New Jersey become disabled each year. Only 1 out of 6 cases receive vocational rehabilitation services. The public must be made to realize by rehabilitating the disabled the Government in turn will receive more taxes for a stronger economy and a healthier Nation. It is an established fact that every dollar spent on rehabilitation brings in \$10 in taxes due to an increase in productivity resources. Most important of all a human being has been guided where he is independent and not dependent.

II. SPECIAL EDUCATION

A. General presentment of problem

Unfortunately, in presenting testimony pertaining to the deaf and hard of hearing preschool and school-age children it is very difficult to offer statistics that would reflect the magnitude of our problem. Testimony is best presented by citing that in Hudson County, N.J., there isn't any place where parents of the preschool deaf and hard of hearing child can receive a complete diagnostic and clinical workup. The Jersey City Hearing Society offers a limited diagnostic workup which only includes audiometric tests and speech reading by nonprofessional personnel.

B. Preschool deaf and hard of hearing children

The education of the preschool deaf and hard of hearing child depends so much on a professional diagnostic and clinical workup. With this type of evaluation the parents and the child are guided properly. At this stage of the child's life it is of utmost importance that the parents as well as the child be helped. Parents must be taught to accept the child's handicap and should be taught to work together with the professional personnel of the speech and hearing clinic.

To date the preschool child in Hudson County is in serious need of a preschool nursery whose efforts will gradually be coordinated in with the local board of education. When the child is of school age the board of education will have a prepared case history of the child.

C. School-age deaf and hard of hearing children

I best offer testimony by stating that the school age child is being offered a very limited type of program. There is an urgent need for more competent teachers. I best exemplify by citing that in one of Hudson County's hard of hearing classes there are nine children representing five different grade levels. Under these conditions it is physically impossible for one teacher to devote the time necessary to teach the children properly.

D. Conclusion: What is needed to help solve the unmet needs in the special education field for the deaf and hard of hearing

Enact Federal legislation whereby grants may be given to States for the following neds:

1. Survey.—An accurate State survey of all handicapped in the country should be taken by a competent group of legislators, clergymen, laymen, agencies, and educators. Survey must have birth as a starting age.

2. Research.—Higher institution of learning to enter into research pertaining to the best methods of teaching the handicapped.

to the best methods of teaching the handicapped

3. Teachers.—Based on research findings offer courses to teachers presently in the field and students entering the field.

4. Public relations.—To encourage municipalities to increase the salary pay scale of the present teachers and increase the basic pay rate of new teachers entering the field.

PROPOSAL FOR THE ESTABLISHMENT OF A SPEECH AND HEARING CLINIC AT THE JERSEY CITY MEDICAL CENTER

PROPOSAL

The establishment of a Speech and Hearing Center at the Jersey City Medical Center, with the possibility of being affiliated with the Seton Hall College of Medicine and Dentistry.

PURPOSE

At the present time, based on a survey made in 1949 and applying the percentages to the 1950 census figures, Hudson County has 45,500 hard-of-hearing people with about 4,000 of this group of school age. These figures are definitely on the conservative side.

Adequate facilities are not available for a complete diagnostic workup, as a result of this condition persons must go elsewhere.

Parents of preschool children with impaired hearing must take the youngsters out of town to get the proper diagnosis and therapy. This can be very discouraging as well as time consuming, as it entails visits three times a week in

64 500 00

training the children. This is exhausting physically for the child and financially for the parent.

Aside from the limited services offered by the Jersey City Hearing Society, older people have no other source of help in the entire county.

WHAT THE CLINIC COULD OFFER

I. Complete diagnosis to include:

A. Medical:

- Otological analysis.
- 2. Medical or surgical treatment if indicated.

B. Audiological analysis:

- 1. Nature and extent of loss to be measured by:
 - (a) Pure tone audiometric test for hearing threshold.
 - (b) Speech reception threshold test.
 - (c) Speech discrimination threshold test.
 - (d) Recruitment test.
 - 2. Extent of disability in terms of:
 - (a) Social adjustment.
 - (b) Psychological adjustment.

C. Rehabilitation:

- 1. Hearing aid selection.
 - 2. Auditory training.
 - 3. Lipreading.
 - 4. Speech therapy.
 - 5. Psychotherapy.
 - 6. Followup in very difficult cases,
 - 7. Instructions to parents or relatives.
 - 8. Persons requiring speech treatment.
 - 9. Nonprofit workshop.

D. Personnel:

- Otologist—assumes responsibility for services as outlined under A.
- Audiologist—assumes responsibility for services as outlined under B. 3. Secretary.
- 4. Volunteers.

1. Soundproof room No. 403 Ct

Equipment (minimum)

1. Soundproof from No. 408 Ct	
2. Allison of test instrument (pure tone air and bone conduction

	•

FUNDS OR METHODS OF FINANCING

- Fees for services.
- 2. Workmen's compensation and insurance.
- 3. United fund.
- 4. Other handicap agencies.
- 5. Board of education.
- 6. Vocational rehabilitation service.
- 7. Federal assistance, Public Law 565.

CONCLUSION

This outline should be given serious and complete study. Our community definitely must try to establish this proposed program. It gives only the minimum services needed in a city of this size, and should be included in the overall plan of the Seton Hall Medical School-Jersey City Medical Center.

STATEMENT BY DR. BOYD E. NELSON, DIRECTOR OF SPECIAL EDUCATION, NEW JERSEY STATE DEPARTMENT OF EDUCATION

Six years ago a child-by-child count was made of children in New Jersey public schools who were determined to be in need of special education services because of mental retardation and physical disabilities. No child was counted twice. About 4.6 percent of schoolchildren were reported as needing special education, and the study committee determined that about half of these could be properly served in regular school programs without special education. Therefore, about 2.3 percent of the total school enrollment was determined to need special education because of mental retardation and physical handicaps.

New mandatory legislation was enacted in 1954, and New Jersey made tre-mendous progress in developing new programs for handicapped children. Today, if the 2.3-percent figure still holds true, the New Jersey program is approximately 60 percent effective in terms of the categories of children included in the survey and who are receiving some type of special education. We do recognize that large numbers of this 60 percent are not receiving the most desirable type of special education, and that much is lacking in the quality of programs

for those who are receiving appropriate special education.

During the past 5 years our National Congress has passed legislation to aid in the education of blind children; to develop research in the area of education for retarded children; to grant scholarships to persons training to supervise school programs for retarded children; and to develop and facilitate captioned films for the deaf. In each instance, certain administrative or supervisory responsibilities have been implied or assigned to the State Department of Education. In each instance it seems necessary in order to make even token and somewhat ineffectual gestures toward administering Federal aid, to further dilute already woefully lacking services which the department of education provides to handicapped children in general. To assume that State legislators will provide effective means to carry out the provisions of Federal Acts designed in the pattern recently established has proved complete folly, and may have done injury to overall programs for handicapped children in some instances. We do not deny that good may also have resulted in many instances. I see nothing in House Joint Resolution 494 dealing with training of teachers for the deaf and speech defective which deviates from this pattern to dissipate present administrative and supervisory services now provided handicapped children.

The most urgent needs in the field of special education, which includes rehabilitation, are first in the areas of administration and supervision. Without proper administration it is better to forget about serving needs regardless of their seriousness and numbers. Possibly to a greater extent than in any other field of education, severe administrative, supervisory, and teacher problems exist in special education. This is true in terms of services for exceptional children within local school districts, at the county level, within our colleges and univer-

sities, and at the State level.

The most ineffective first steps of which I can conceive for meeting needs in special education would be to adopt plans merely involving the granting of scholarships. Too frequently these scholarships go to-

(a) Persons who would go into special education regardless of scholar-

ships.

(b) To persons who may not have been adequately screened due to ineffective administrative services.

(c) To persons who when once trained will find employment in more status giving administrative, supervisory, or teaching positions than those existing in the field of special education.

By far, greater numbers of teachers of handicapped children in New Jersey serve with emergency certification than in any other area of teaching. Needs, however, go much deeper than giving additional partial training to personnel who then often leave the field. Personnel desert or do not join the field of special education because their salaries and status often are not commensurate with their training; because they are not given sufficient and sympathetic supervision and inservice help; because they serve without adequate facilities.

Another point which has caused grave concern has been a superficial evaluation of needs according to category of handicapped. When we observe a superior program for our exceptional children in a school system, we almost always observe a good program which is providing services in a variety of categories. This program is good not because children have been classified into smug categories, but because a board of education has been concerned with the basic needs

of handicapped children in terms of administration, supervision, early identification, assessment of problems, quality of personnel, facilities, finance, research, followup procedures, inservice and other training opportunities, and interdiscipline and interagency cooperation.

STATEMENT OF JULIAN G. STONE, PRESIDENT, NEW JERSEY REHABILITATION ASSOCIATION

My name is Julian G. Stone and I am president of the New Jersey Rehabilitation Association. Our association is vitally interested in H.R. 3465, which will create program and facilities for the severely disabled so that they may

achieve independent living.

All studies of disabled persons in this country have indicated that there is a tremendous number of severely disabled individuals who do not meet the generally accepted standards presently established by the vocational rehabilitation services. Many of these people have applied for help and have been found to be ineligible. But they have rehabilitation needs, provision for which is not included in the current concept of vocational rehabilitation. They do not have vocational potential, according to the current standards.

It has become apparent, through intensive study of this problem, that many such severely disabled persons, if provided with proper evaluation and restorative services, may be found to possess varying degrees of vocational potential, who otherwise might have to accept objectives that do not include vocational

In 1958 alone, over 2,000 cases were rejected by the New Jersey Rehabilitation Commission as not eligible. We are convinced that in the State of New Jersey there are many more thousands of individuals who have unnecessarily been relegated to the human wasteheap. We strongly feel that such individuals should have an opportunity to make the most of their potentials without regard

to what their ultimate accomplishments may be.

We believe that the addition of independent living rehabilitation services will result in a great improvement in the present vocational rehabilitation services. With proper evaluation, we are sure that many individuals who might be considered nonfeasible in terms of rehabilitation according to present definitions, will be found to have, if not full-time employment potential, at least part-time. By the same token, those who are accepted for vocational rehabilitation may be found to be unemployable and hence transferred to the independent-living program.

There are many benefits which would result from the independent-living

program. I would like to mention a few:

 It will prevent the institutionalization of a significant number of handicapped people, thereby alleviating the overcrowded conditions of institutions and cutting down on their waiting lists.

(2) It could conceivably prevent the building of additional institutions, there-

by saving the taxpayers considerable sums of money.

(3) It would relieve a member of the household of the responsibility for the constant care of the handicapped person, which might eventuate in obtaining outside employment, thereby adding to the family income.

(4) Last, but not least, it would mean the restoration of human dignity for the handicapped individual.

Mr. Elliott. At this point I will state for the record and for our friends who are present this afternoon, that under the auspices of our Subcommittee on Special Education of the U.S. House of Representatives, a study which we call our special education and rehabilitation study, is being conducted. This study is being conducted through the mechanics primarily of workshops which are being held all over this country of ours.

One of these workshops was held the past 2 days in Philadelphia and we have present with us this afternoon the director of the special education and rehabilitation study and I would like for him to stand at this time. I refer to our friend, Dr. Merle E. Frampton, director

of the study.

Dr. Frampton, will you stand and let the folks see you.

Dr. Frampton is a famous educator in this field. He works with our committee and cooperates with us as he goes about the work of gathering the information that we seek from all sections of America.

The assistant to Dr. Frampton, as the director of the study, is Dr. Elena D. Gall. Dr. Gall is professor of education at Hunter College and is the assistant to the director of our study in charge of field studies.

Dr. Gall's role in this matter has been to conduct the workshops over the country which I have mentioned, the latest of which just closed

was Philadelphia.

I am told that several of the participants in the workshop must get away and at this time I am going to recognize Dr. Gall to call upon the people selected by the workshop to testify in its behalf.

For our record, Dr. Gall, and for the benefit of all of us will you

tell us a word about how the workshop was set up?

STATEMENT OF DR. ELENA D. GALL, PROFESSOR OF EDUCATION, HUNTER COLLEGE

Dr. Gall. Mr. Elliott and members of the Subcommittee on Special Education, we are delighted this afternoon to bring to you the reports of the workshop which was held for the last 2 days in Philadelphia and which represents this region of the country; namely, the States of Delaware, New Jersey, Maryland, and Pennsylvania.

You can see by the assistance that I have received in filling out the total number of States which comprise this area the kind of cooperation that we have been extending to each other from State to State

in the last 2 davs.

The Eastern Atlantic Regional Workshop was held at the Institution of Local and State Government at the University of Pennsylvania and we divided our 180 participants into sections which are represented by the titles, "The Gifted and the Talented," "The Hearing Handicapped," "The Mentally Retarded," "The Physically Handicapped," "The Socially and Emotionally Handicapped," "The Speech Handicapped," and "The Visually Handicapped.

These are the seven areas about which we spoke and heard many,

many types of information in the last 2 days.

If you had been present at the Fells Institute you would have seen small groups of leaders in this part of the country voice their opinions, bring information, disagree with each other, and then later perhaps have a meeting of the minds.

All of this information will be reported in the final compilation of reports which will be made available to your committee, Mr. Elliott.

But this afternoon it gives me a great deal of pleasure to tell you that there are representatives of these various workshops present who

will give you a summary of their deliberations.

They will tell you that in their workshops they have had many disciplines represented, psychiatry, medicine, psychology, education, school administration, family group representatives, parent representatives, labor, and law; they were all together in setting up the kind of recommendations that they thought your subcommittee might want

to need and study in order to form your own opinions about the unmet needs of this particular geographic region.

Most of our participants came on their own expense and used their own valuable time in order to bring this information to you.

Many worked until very late last evening and some completed their

reports at 8:30 this morning.

It gives me a great deal of pleasure. Mr. Elliott, to tell you that our fourth field study, our regional workshop in this region, was one of the most successful we have held.

I will let you have the list of names of those who are representing

their particular workshops. All of them are here.

Mr. Elliott. Thank you very much, Dr. Gall.

You know, this was the fourth workshop, Dr. Frampton. The report I get is that each is better than the one before.

So I feel that they are going very well and we are happy about it. Before I call the witnesses from the workshops, let me say that if there is anyone who just has to get away by 4 o'clock or 4:30, or a particular time, if he will let Dr. Barnard or Miss Alice Hartman

know, I will try to accommodate him as I call the witnesses.

The first witness on our list is Dr. Georgia Lightfoot, State Supervisor of Special Classes, State Department of Public Instruction,

Dover, Del.

How are you, Dr. Lightfoot?

Dr. Lightfoot. Fine, thank you, Mr. Chairman.

Mr. Elliott. Dr. Lightfoot comes to you as representative of the group on the gifted and the talented.

group on the gifted and the talented

You may proceed, Dr. Lightfoot, and at the end of 10 minutes I may have to tell you that the time has expired.

STATEMENT OF DR. GEORGIA LIGHTFOOT, STATE SUPERVISOR OF SPECIAL CLASSES, STATE DEPARTMENT OF PUBLIC INSTRUCTION, DOVER, DEL.

Dr. Lightfoot. As have the others, gentlemen of the Congress of the United States, this particular section is cognizant of the great honor we have and a great opportunity to present the cause of the gifted children of America.

We realized that we did not know all the unmet needs, but we

found some that were self-evident.

We would like to have you keep in mind with us that true democracy as applied to education means the opportunity for all individuals to develop each of them to the utmost of his own inborn potential.

Such an opportunity has not been afforded. It has even been de-

nied to many gifted and talented people.

It is not true that they can take care of themselves and it may have become a cliche almost by now to say America's most neglected natural resource, nevertheless, that is true and we are the losers for having so neglected them.

We then are grateful for the chance to make an effort to rectify that situation, and hope you will consider this cause carefully among

the others.

I am honorbound to report faithfully in the phrasing of the members of the committee the recommendations that they had to make.

First they place this one: Financial assistance should be given by the Federal Government to the States for the purpose of furthering the inservice education of teachers, an area of educating the gifted through workshops and fellowships. The appropriations suggested is \$1 per year per child enrolled in the public school system for the next 5 years.

We feel the unique aspect of our recommendation here is that we are asking for further answer of the education of all teachers, not

just a segment to be known as the teachers of the gifted.

This because we are all too well aware that there are some teachers

who do not recognize gifted children when they see them.

Our second recommendation, title V of the National Defense Education Act, should be extended in the elementary school on the same financial and operational basis as is now provided at the secondary level in order that gifted children be identified as early as possible.

We felt very strongly about this. It is indeed a mistake to wait until of high school age before we identify our gifted and do some-

thing about them.

The time is when they are 2 and 3 years of age, or 4 or 5 or 6 at the

Mr. Elliott. Doctor, do you not think we have made a little bit of progress in that direction when we made a start 2 years ago?

Dr. Lightfoot. You certainly did, and we are happily aware of this. We do not mean to be grasping. We are just urging you to go even further, hoping that we have brought this to your attention. It indeed was a most important start.

Mr. Elliott. Do you think we need next to bring those facilities and

aids to the grammar school? Is that what you are saying?

Dr. Lightfoot. Yes, indeed.

Mr. Elliott. Do you think down below the school level?

Dr. Lightfoot. Yes.

Our third recommendation, \$3 million annually for a period of 5 years should be appropriated by the Federal Government on a matching basis for the development of experimental programs and for strengthening existing programs for the gifted. We feel that there are a number of isolated experiments, that there should be many, many new ones, but there are some good programs underway. They are going to fall by the wayside, however, unless they get more financial assistance than is now possible to them from local sources.

Four, matching funds should be appropriated on the same basis as now provided in other areas under title III of the National Defense Education Act for the purchase of library and other instructional materials to improve the education of the gifted in the humanities broadly conceived in order to promote the development of social and political

leaders.

We feel that it is just as important to develop statesmen like your-

selves as it is perhaps experts in physics and chemistry.

Five, grants to total \$3 million should be appropriated annually over a period of 5 years to conduct research in the following areas: A. Identification of the gifted;

B. Determination of the needs of the gifted;

C. Programs of education of the gifted.

D. Motivation of the gifted.

E. Nature of creative, critical thinking and leadership potential;

F. Administrative organization for education of the gifted. Six, all research on the gifted should be coordinated by the U.S.

Office of Education.

Seven, a commission should be appointed to study the function of the U.S. Office of Education for the purpose of determining ways in which it can stimulate the improvement of the education of the gifted.

These, we felt to be the outstanding unmet needs. We should establish, I think, that the recommendations made for appropriations are based on the estimate of approximately 3 million children enrolled in the public schools of the four States comprising the eastern Atlantic

region, Delaware, Maryland, Pennsylvania, and New Jersey.

We have a final remark. The members of this section trust that the Congressmen will bear in mind that the gifted do not belong in the category of the handicapped and, therefore, we are all concerned with the development of appropriate educational patterns and opportunities for exceptional children of high mental ability. Thank you very much for your attention.

Mr. Elliott. Thank you very much, Dr. Lightfoot.

May I recognize the gentleman from Connecticut, Mr. Giaimo. Mr. Giaimo. Did you say that you felt that the gifted did not belong

in the category of the handicapped?

Dr. Lightfoot. Yes. There are individuals who have physical handicaps, perhaps a handicap of emotional disturbance possibly, who are also gifted.

If there is any handicap it is not because of a mental ability, but regrettably they sometimes are handicapped by this high level because of the way they are treated in our society, the group in which they

find themselves.

Mr. Giaimo. Then do you think that the gifted would suffer by being included in a projected program dealing with the handicapped, would suffer in the sense that perhaps they might not be able to show that their need for priority type of legislation, for example, would be as great?

Dr. Lightfoot. This classification troubled members of the committee, our workshop group, to the degree that they also argued this

very point.

Should we not get it established that they should be treated by themselves. Certainly they did want the idea clear that they were in a separate category, or did not belong in the category of being

handicapped.

They are perhaps fortunate in their endowment, but they have suffered on occasion because of high endowment and particularly at an early age and the result of this has been that they have not achieved and produced to the degree that they might otherwise have done so in a more friendly climate, not a hostile one, or with more assistance.

And sometimes outright financial assistance.

This is why we particularly feel that teachers of all types need this further instruction in particular kinds of workshops to improve their attitudes toward the gifted, to gain insight as well as knowledge of how to meet their needs.

Not for one moment however, do we want to take any chance of their failing to receive assistance.

Mr. Elliott. Thank you very much, Dr. Lightfoot.

Dr. Lightfoot. Thank you, Mr. Elliott. (The formal report referred to follows:)

REPORT OF EASTERN ATLANTIC STATES WORKSHOP ON THE GIFTED

Chairman: Dr. Georgia F. Lightfoot, State supervisor of special classes in Delaware, representative of this workshop reporting to the subcommittee hearings, February 17, 1960.

Cochairman: Dr. Geneva Ely Flickinger, Maryland State supervisor of

special education.

True democracy, as applied to education, means the opportunity for each individual to develop to the limit of his inborn potential. Such an opportunity has not been afforded, it has even been denied to many gifted and talented people.

The members of this section on the gifted of the Eastern Atlantic States Workshop are grateful for the chance to make an effort, at least, to rectify this

situation.

At the outset of our deliberations, we realized that we did not know all the unmet needs of the gifted and talented, but on the basis of those lacks that were obvious, the "unmet needs" that were most evident, the members of this group agreed on these recommendations:

1. Financial assistance should be given by the Federal Government to the States for the purpose of furthering the in-service education of teachers in the area of educating the gifted through workshops and fellowships. The appropriation suggested is \$1 per year per child enrolled in the public school system for the next 5 years.

2. Title V of the National Defense Education Act should be extended into the elementary school on the same financial and operational basis as is now provided at the secondary level, in order that gifted children be identified as early

as possible.

3. Three million dollars annually for a period of 5 years should be appropriated by the Federal Government on a matching basis for the development of experimental programs and for strengthening existing programs for the gifted.

4. Matching funds should be appropriated, on the same basis as now provided in other areas under title III of the National Defense Education Act for the purchase of library and other instructional materials to improve the education of the gifted in the humanities (broadly conceived), in order to promote the development of social and political leaders.

5. Grants totaling \$3 million should be appropriated annually over a period of

5 years to conduct research in the following areas:

(a) Identification of the gifted.

(b) Determination of the needs of the gifted.

(c) Programs of education of the gifted.

(d) Motivation of the gifted.

(e) Nature of creativity, critical thinking, and leadership potential.

(f) Administrative organization for education of the gifted.

6. All research on the gifted should be coordinated by the U.S. Office of Education.

7. A commission should be appointed to study the function of the U.S. Office of Education for the purpose of determining ways in which it can stimulate the improvement of the education of the gifted.

The recommendations for appropriations are based on the estimate of approximately 3 million children enrolled in the public schools of the four States comprising the Eastern Atlantic Region, Delaware, Maryland, Pennsylvania, and New Jersey.

The members of this workshop section trust that the Congressmen will bear in mind that the gifted do not belong in the category of the handicapped, and therefore we are all concerned with the development of appropriate educational patterns and opportunities for exceptional children of high mental ability.

Mr. Elliott. Our next witness is Miss Elizabeth Titsworth, assistant superintendent, New Jersey School for the Deaf. She will give the report of the workshop on the section entitled the Hearing Handicapped.

Miss Titsworth.

STATEMENT OF ELIZABETH TITSWORTH, ASSISTANT SUPERIN-TENDENT, NEW JERSEY SCHOOL FOR THE DEAF, WEST TRENTON, N.J.

Miss Trisworth. Mr. Elliott and members of the committee, our report is in this form. They considered the hearing problem of the young child, school age child, and the adult.

Mr. Elliott. Before you get started, let me also say that our witness is the assistant superintendent of the New Jersey School for the

Deaf in West Trenton, N.J.

Miss Titsworth. The thinking was that there is one person in a thousand who is severely deaf and three in a thousand who have mild or moderate hearing loss.

The greatest problem is that there is inadequate and insufficient

training staff.

It was highly recommended that before Federal funds are expended authorities in professional national organizations have some consulting status. There are such things that come up as a difference between a clinician and a teacher of the deaf.

The clinician is charged with the responsibility of training the hearing impaired in speech and in hearing rehabilitation, whereas the teacher of the deaf is responsible for teaching subject matter, develop-

ing language and speech and training of hearing.

Some of the needs that are being met in various ways are the detection being carried on by the school screening program. There is referral by individuals and professional organizations and the child health programs are referring.

In the health services there is good diagnosis and evaluation and in the educational phase of it we have the State-supported residential schools, the day schools in local districts, day classes in local districts,

and private and denominational schools.

For professional training there are the institutions for the preparation of teachers and for the preparation of allied personnel. There are definite lacks in case detection and identification. Something that needs to be worked out is uniformity of procedures and equipment used. Also, there is a shortage of trained personnel for detection and identification, and lack of personnel for appropriate followup.

In the health services there is a shortage of personnel in regard to rehabilitation workers and followup and in recruiting of personnel.

In the educational field there is a definite shortage of personnel,

both for teachers and allied personnel.

The multiple handicapped child has entered into the picture and this is a place where there needs to be study and a development of building up of personnel for teaching and understanding of this child.

Research will probably come in at this point and this is a place where we need to extend the program throughout the Eastern States.

In the educational field only a fraction of the hearing impaired children's needs are being met by trained persons. It is a serious need that funds be provided for training classroom teachers and administrative personnel at all educational levels.

The research program should provide for dissemination of research findings to classroom teachers, administrators, and allied personnel.

In most cases at present such findings are extremely limited. There is a need for expansion and expansion of research in regard to the multiple handicapped should include the incidence, the diagnosis, medical treatment, educational needs, administrative management and standards for such a program.

The needs of preschool children must be explored and expanded. As we have learned of late, children under four who are deaf benefit greatly from an educational program. In some States the school entrance age is four and it is necessary to reach down to the 2- and

3-year-old children.

Another phase that was discussed was that of rehabilitation. was recognized that there is a group of people with hearing problems that are developing due to industrial deafness. It certainly calls for

research and taking steps that will prevent this.

Secondly, it was felt that there are gaps in the vocational training of the deaf and hard of hearing and it was advised that we have to reach down to the age of 12 and 13 as a possible beginning for educational consultants in vocational lines.

There was a discussion of the gereatric aspects of hearing impairment. At present there are 10 homes for the aged deaf in existence which are maintained by various organizations of the deaf. Indica-

tions are that more will be needed.

Also, as far as vocational rehabilitation is concerned, the multiple handicapped needs help and their possibilities need to be researched along those lines.

It is recommended that sheltered workshops be provided for meet-

ing the need of some of the multiple handicapped.

Mr. Elliott. Thank you very much, Miss Titsworth. (The formal statement of Miss Titsworth follows:)

Workshop Report on the Hearing Impaired

Cochairmen:

Lloyd A. Ambrosen, superintendent, Maryland School for the Deaf representing special education.

Dr. William G. Hardy, director, hearing and speech center, Johns Hopkins medical institutions, Baltimore, Md., representing rehabilitation. Corecorders:

Dr. Powrie V. Doctor, editor, American Annuals of the Deaf, Gallaudet College, Washington, D.C.

Richard B. French, coordinator of speech and hearing services, Delaware Department of Public Instruction, 17th and Union Streets, Wilmington,

Workshop participants:

Francis I. Catlin, M.D., associate professor of otolaryngology, Johns Hopkins medical institutions, Baltimore, Md.

Sam B. Craig, superintendent, Western Pennsylvania School for the Deaf, Edgewood, Pittsburgh, Pa.

Leo G. Doerfler, director, department of audiology, University of Pitts-

burgh, Pittsburgh, Pa.

Eldon L. Eagles, M.D., director of field studies, subcommittee hearing academy of otolaryngology, University of Pittsburgh Graduate School of Public Health, Pittsburgh, Pa.

Sarah Goldberg, president of the board, Friends of the Deaf Nursery School, 1516 W. Girard Avenue, Philadelphia, Pa.

John G. Nace, headmaster, the Pennsylvania School for the Deaf, Philadelphia, Pa.

Marion L. McVeigh, associated regional representative, region 11, Office of Vocational Rehabilitation, 42 Broadway, New York, N.Y.

Dr. Salvatore G. D. Michael, regional representative, U.S. Office of Vocational Rehabilitation, New York, N.Y.

L. Dino Reed, Dr. Sci., audiological consultant, division of maternal and child health, Pennsylvania Department of Health, Harrisburg, Pa.

Jean Stifler, M.D., chief, division for crippled children services, State department of health, State Office Building, Baltimore, Md.

Elizabeth F. Titsworth, assistant superintendent, New Jersey School for the Deaf, Trenton, N.J.

Dr. Peter R. Wisher, chairman, department of physical education, Gallaudet College, Washington, D.C.

Allan B. Jones, State supervisor, bureau of vocational rehabilitation, Harrisburg, Pa.

Joseph Sataloff, M.D., director of research, Jefferson Medical College, Philadelphia, Pa.

Margaret McCormick, principal, Willis and Elizabeth Martin School for the Deaf, Philadelphia, Pa.

Participants representing the Eastern Atlantic Region on Hearing Impairment met from 10 a.m. to 4 p.m. on February 16 and 17 at Fels Institute on Social and State Government, University of Pennsylvania, Philadelphia.

REPORT ON SPECIAL EDUCATION

Incidence

1. The incidence of hearing impairment is of such nature that increased services personnel, and research are needed on a scale requiring much greater efforts. The incidence is believed to be 1 in 1,000 for the severely hearing impaired (deaf) and 3 in 1,000 for mild to moderate hearing impaired (hard of hearing). Due to increasing population, medical science and improved diagnostic procedures and general public interest in special education; these figures represent, at best, conservative estimates. Many children are being saved who formerly succumbed, but at the expense of sensory performance and capacity to learn

Adequacy of present services

2. We do not have adequate personnel or services to meet the needs of all hearing impaired children in the eastern Atlantic region. In addition to the need for sufficient personnel and services problem, the scarcity of adequately trained personnel is our most serious problem.

GENERAL STATEMENTS

It is highly recommended that before Federal funds are expended authorities in professional national organizations have some consulting status.

The distinction between a clinician and a teacher of the deaf must be clearly kept in mind. The clinician is charged with responsibility of training the hearing impaired in speech and hearing rehabilitation, whereas the teacher of the deaf is responsible for teaching subject matter, language and speech development and aural rehabilitation.

One of the most urgent needs in the area of deafness is in the field of public opinion and especially in allied groups. Professional people such as these in psychology, sociology, nursing, medicine, teacher training, and public school personnel should be made aware of the problems in this area, even to the extent of Federal money being spent for such purposes.

Some of the needs being met in varying degrees at the present time are represented in the following areas:

1. Detection:

(a) School screening programs.

(b) Referrals from individuals, professional agencies, and individuals.

(c) Child health programs:

Public.

Private.

- 2. Health Services:
 - (a) Diagnosis and evaluation.
 - (b) Medical, audiological, and psychological.
- 3. Diagnostic Services:
 - (a) Schools. (b) Colleges and university hearing and speech centers.
- (c) Hospital speech and hearing clinics.
- 4. Education: A. School facilities:
 - (1) State supported residential schools.
 - (2) Day schools in local districts.
 - (3) Day classes in local districts.
 - (4) Private and denominational schools.
 - B. Professional Training:
 - (1) Preparation of teachers.
 - (2) Preparation of allied personnel.
- The deficiencies in the above programs are as follows: 1. Case detection and identification:
- (a) Diagnostic criteria (uniformity of procedures and equipment).
- (b) Training of personnel. (c) Appropriate followup.
- 2. Health services:
 - (a) Rehabilitation workers.
 - (b) Followup.
 - (c) Personnel.
 - (d) Facilities and equipment.(e) Multiple handicaps.

 - (f) Recruitment of personnel. (g) Standards in all areas.
- 3. Diagnostic.
- 4. Educational:
 - (a) Personnel.
 - (b) Multiple handicaps.(c) Training facilities.
- 5. Research:
 - (a) Dissemination of information.
- (b) Lack of adequate research in terms of personnel and programs. 6. Multiple handicaps (a child who has, in addition to the major handicap of impaired hearing, other educationally handicapped conditions):
 - (a) Incidence.
 - (b) Diagnosis.
 - (c) Medical treatment.
 - (d) Education.
 - (e) Administration.
 - Recommendations of the workshop to the subcommittee are:
- 1. Case detection and identification:
 - (a) Recruitment and training of personnel for case finding and identification:
 - (b) Recruitment and training of supervising personnel.
- 2. Health services:
 - (a) Increase in personnel in all areas.
 - (b) Assistance in upgrading facilities and personnel.
 - (c) Assistance in establishing standards and criteria for all areas.
 - (d) Diagnostic.
 - (1) Criteria in diagnosis covering medical, psychological, and educational findings and recommendations.
- 3. Educational:
 - (a) With only a fraction of the hearing impaired children needs being met by trained personnel a most serious needs is for funds to provide training for classroom teachers and administrative personnel at all educational levels.
 - (b) Personnel with adequate training to meet the needs of multiple handicapped children is most urgent.

4. Research:

- (a) A program providing for dissemination of research findings to classroom teachers, administrators and allied personnel. In almost all cases dissemination of such findings is extremely limited.
- (b) Extension and expansion of research into multiple handicaps covering:
 - (1) Incidence.
 - (2) Diagnosis.
 - (3) Medical treatment.
 - (4) Educational needs.
 - (5) Administration and management of programs.
 - (6) Standards in programs.
- (c) Preschool children.
- (d) Hearing-impaired children having language disorders.
- (e) Language disorders in other children,
- (f) Validation of training procedures for hearing-impaired children.
- (g) Social adjustment problems of adolescent hearing-impaired children.
- Multiple handicaps:
 - (a) Diagnosis.
 - (b) Incidence or census procedures.
 - (c) Proper medical treatment.
 - (d) Education programs appropriate for these children.

PROBLEMS OF HEARING IMPAIRMENT—REPORT ON REHABILITATION

The group chose to treat the problems of rehabilitation as differently oriented than those of special education. Whereas it was recognized that there is clearly a continuing need for each family to maintain responsibility for its own problems, it was recognized, as well, that several aspects of rehabilitation of the deaf and the hard of hearing present unmet needs which could be met by support for both training and research at the national level.

First, rehabilitation counselors commonly have little awareness or understanding of hearing problems, and relatively little awareness of the broad health aspects, and the health services available, which should be considered at the level of differential diagnosis, management, training, and followup toward rehabilitative goals. The group recommends that the training and education of rehabilitation counselors should be intensified and broadened in all aspects of the special needs of hearing-impaired persons. Special training units and grants might well be made available to rehabilitative personnel for short-term courses.

Second, it was felt that there were many gaps in the steps between early vocational training in school and later specific requirements of the individual at the level of job placement. To fill this gap, it is recommended that extensive joint planning be undertaken between personnel in rehabilitation (and in health services, as pertinent) and in special education. This would involve the use of rehabilitation counselors as consultants during the school years from age 12–13 on, and possibly the use of educative consultants later on. This step might well

entail changes in current State laws.

Considerable time was spent in discussion of various aspects of the problems of industrial noise. There is ample evidence that this is a massive problem, involving millions of adults. The scope and magnitude of the problem of noise in industry cannot be overemphasized in terms of lost man-hours, of lessened income, of the level of work output, and on problems of long-term compensation for the affected person. Because of the many ramifications for industry, labor, insurance, and rehabilitation, an extensive research inquiry including all these interests is clearly indicated. It becomes apparent that one possible and important solution to the general problem centers in prevention. This will require an extensive program of education. Meantime, it is felt that government and other appropriate agencies could do much to originate and enforce safety regulations and practices to control the hazards of industrial noise.

Fourth, there was long discussion of the geriatric aspects of hearing impairment. There are some 10 homes for the aged deaf in existence which are maintained by various organizations of the deaf. Many more are needed. It is particularly important that these persons remain in contact with both hearing and deaf adults. To this end, it was suggested that room be made for the aged deaf in homes for mixed groups. Moreover, a need was expressed for research

into the behavioral, social, and emotional effects of hearing impairment on the adult, both the deaf and the hard of hearing. Very little has been accomplished in this regard, and the dearth of information directly effects both vocational

and geriatric aspects.

The last general topic discussed had to do with the multiple handicapped persons. In this regard, the term "multiple handicapped" refers to a person who has in addition to a major handicap in hearing other handicapping conditions. The group recommends that an appropriate survey (not a census) be undertaken to determine the number of such multiple handicapped persons in the country. No single professional group has access to such a figure. Without it, it is practically impossible to consider seriously the kinds and numbers of personal and special facilities required.

There were a few specific ideas related to different aspects of the problems of hearing impairment. First, the need for research on curriculum and methods of vocational instruction for deaf persons. Second, the possible use of regional vocational training schools for the deaf, staffed with persons trained to teach the deaf in various shop practices. Rehabilitation counselors can find the necessary jobs, but the individual must first have the necessary skills; they cannot be learned by on-the-job training. Third, the need to alert industry to the potential in supervisory and administrative positions of the deaf; this, too,

probably requires a public educative program.

Mr. Elliott. Our next witness comes from the section on the mentally retarded of the Philadelphia workshop and that witness is Dr. Harry Selznick, of the Department of Special Education, Baltimore Public Schools, 3 East Twenty-fifth Street, Baltimore 18, Md.

STATEMENT OF DR. HARRY SELZNICK, DEPARTMENT OF SPECIAL EDUCATION, BALTIMORE PUBLIC SCHOOLS, BALTIMORE, MD.

Dr. Selznick. Mr. Elliott and gentlemen of the U.S. Congress, I have just completed a very stimulating and challenging 2 days in Philadelphia and would like to have these few moments to share with you the experiences through which we have just passed.

I particularly would like to share it with my colleague from back in the Midwest, having formerly lived in Minnesota at one time.

So I feel an akinness to Mr. Quie.

Mr. Elliott. Now, before you get started, are the recommendations that you are going to bring us substantially unanimous from your group?

Dr. Selznick. Sir, I am relaying the recommendations of the group which are the consensus rather than unanimous in nature.

We tried to make our recommendations as realistic as midwesterners can possibly make them.

Mr. Quie. That shows he is from Paul Bunyan land.

Dr. Selznick. Included in our group were persons from special education, including residential and public school settings, rehabilitation, social work, psychiatry, psychology, and our first recommendations dealt directly with meetings such as those in which we directly participated.

We feel that by a provision of an opportunity for persons of the various disciplines to get together this committee has already provided a valuable function to the special education and vocational rehabilita-

tion personnel of the eastern Atlantic region.

We feel that not only did we have an opportunity to share problems, to discuss unmet needs, but also to point toward bright signs in services to the mentally retarded and also permitted us an opportunity to suggest to honorable bodies such as this the kinds of legislation which would better permit us to do the job with which we are entrusted.

As was suggested by several of the others groups, of the major needs in the area of the mentally retarded, two relate to personnel.

It is our suggestion that rather than direct major appropriations to surveys in an effort to locate the size of the problem, that we direct our major energies toward the development of personnel who can meet the problem as it is located and provide meaningful learning experiences for these persons at the level at which they are capable of benefiting, the experiences to be provided at both graduate and undergraduate levels in meaningful amounts, and there was some discussion also of appropriations for fellowships which are not being requested because the amounts are such that the individuals cannot afford to accept fellowships to go on to the training programs to equip other persons in special education.

Another recommendation related to providing opportunities for short-term workshops, to improve interdisciplinary and interagency approach to the adjustments of the mentally retarded, increased support for both faculty students and inservice facilities to persons rep-

resenting all disciplines working with the mentally retarded.

There is a request for training of consulting teams to act with existing or projected facilities and for inservice training in institutions and agencies.

There was an emphasis placed on the need for providing diagnostic and evaluation clinics and service to both urban and rural localities.

The need for strengthening and expanding existing services which are brought into the homes by public health nurses, by visiting teachers, and by social workers.

This particularly related to the management factor, the manage-

ment stage and development of the mentally retarded child.

It is the recommendation of this group that legislation be amended to make it possible for the OVR to provide consultation and guidance for special educational personnel and parents of retarded children regarding training and long-range vocational planning for retarded youth.

The specific age that was suggested was age 13. Occupational training as a part of a sequentially developed program now not available in many public school systems could be implemented and

strengthened by OVR.

At the present time in most States OVR does not step in until age 16. It was felt that assistance should be provided at an earlier stage.

Federal assistance for the establishment of occupational training workshops to supplement public school programs, to train educable mentally retarded for job placement and independent living.

Federal assistance was suggested for the establishment of sheltered workshops to serve as long-time permanent placement for the severely handicapped. This is in reference to the kinds of workshops about which we have heard today basically being sponsored by parent groups.

They have demonstrated the need.

The question is, now, where does the responsibility for maintaining such activities rightfully belong.

Assistance to States for the establishment of regional institutional programs was also pointed up.

These programs would provide day care training.

In the area of research there was recommendation that through increased Federal support, both clinical research, understanding of causetive factors of mental retardation could be achieved.

There ought to be some Federal subsidy to find some more definitive diagnostic techniques and evaluative devices than are now available

to professional personnel.

In the area of coordination it was recommended that an evaluation be made of the functions of the many Federal, State, and local agencies and disciplines which provide for mentally retarded children and youth to determine whether or not a more effective organization of these efforts could be achieved.

It was pointed up that there are over 20 agencies now involved in work with the mentally retarded, that there is already an interagency committee operating for children and youth which might serve as a

facilitating instrument toward this purpose.

Also, facilitating the exchange of information among States and between States and the Federal Government for maximum use of available information and experience, and that responsibility quite possibly ought to be localized in the agency which has overall responsibility for the work with mentally retarded and also a recommendation for intensified effort to make known to the professions the present programs and sources of support at the Federal level.

During the course of our discussions we learned that some supports, with which not all participants in this meeting were familiar, were available and quite possibly a compilation should be made available to all persons so they know what is available as they try to identify

unmet needs.

Thank you very much.

Mr. Elliott. Thank you, sir.

WORKSHOP REPORT ON THE MENTALLY RETARDED

The section representing the States of the eastern Atlantic region and including diverse disciplines, special education, rehabilitation, social work, psychiatry, psychology, first wishes to point to the advantages of this kind of exchange and the review of common problems. Workshops of this type might well be encouraged. These meetings under the official auspices of the House of Representatives provide not only an opportunity for coordinated program planning, but also an opportunity to transmit the recommendations of professionals in this field to those who write legislation.

From the exchange we learned that good programs are in existence in all of our States, although these are by no means adequate to the problems. The major problem area which requires Federal stimulation is that of trained personnel. It remains true that an increase in basic services is necessary in order to meet the needs, but until the personnel are available additional funds for

services will not solve the problem.

Accordingly, our first recommendation has to do with the need in the area of professional personnel. Each of the participating States has conducted incidence surveys which might be used to arrive at an estimate of the numerical size of the problem facing us at each level; diagnosis, education, and rehabilitation.

Before discussing more specific needs and recommendations, it should be noted that mental retardation is a condition involving very different age groups, etiologies, multiple handicaps, and ability levels. A proper program requires the coordinated efforts of many disciplines. This requirement is reflected at all levels (Federal, State, and local) by the participation of many agencies in programs affecting the retarded. At the Federal level it is recommended that

greater coordination be achieved through existing administration channels (such as the Interdepartmental Committee on Children and Youth) in order to clarify

the programs in existence and to identify gaps and reduce overlap,

Development of adequate personnel, in quality and quantity, starts with recruitment to community service and the professions at the high school level. Dramatic and stimulating beginnings could lead students to dedicate themselves to the long process of training which may ultimately result in the members of the professions involved in diagnosis, treatment, education, and rehabilitation. This implies improvement of the educational effort prior to specific programs designed for the undergraduate and postgraduate areas. Increased Federal stimulation of programs designed to produce the needed specialists might well follow the pattern of the Defense Education Act. Additional programs are desirable which utilize experienced individuals and training situations in order to bring these understandings to others who have finished their training and to young people in training to familiarize them with the opportunities in the field. This suggests higher level support for special inservice training programs open to other appropriate personnel.

SERVICES

The need for improving existing facilities and knowledge should be met systematically and not by simple multiplication of present facilities. We endorse the following program:

1. Strengthening existing facilities in terms of staff, research, and treatment.

Utilize, where practical, existing facilities for teaching and training.

3. Improvement of services on a qualitative basis by encouraging development of staff and physical facilities designed to meet the needs; improved coordination of agencies offering independent services in overlapping need areas; and the support of developments in community services aimed at prevention.

4. As the effects of these steps are felt, it should become possible to expand

facilities more meaningfully.

RESEARCH

We agree on the encouragement of research efforts at understanding the causes of mental retardation. Increased support (might well) be given to the improvement of differential diagnosis on an interdisciplinary basis and to experimental development of treatment and educational methodologies.

RECOMMENDATION-PERSONNEL NEEDS

1. Increase support and expansion of university training facilities on undergraduate, graduate, and postdoctoral levels for all disciplines concerned with problems of the mentally retarded.

2. Encourage specialization on the graduate level through the provision of

adequate scholarships.

3. Provide opportunities for short-term workshops to improve interdisciplinary and interagency approach to the adjustment of the mentally retarded.

4. Increase support both for faculty and students for inservice training facilities for personnel representing all disciplines already working with the mentally retarded.

5. Training of consultant teams to act with existing or projected facilities and for inservice training in institutions and agencies.

Increase support to facilitate greater coordination between university and field training centers.

STRENGTHENING SERVICES

1. Provide diagnostic and evaluation clinics and services to both urban and rural localities.

2. Establishment of comprehensive day-care centers for those whose needs are

not met under public school auspices.

3. Strengthen and expand existing services brought into the homes by public health nurses, visiting teachers, and social workers.

WE RECOMMEND

1. Amended legislation to make it possible for OVR to provide consultation and guidance for school special education personnel and parents of retarded children regarding training and long-range vocational planning for retarded youth from an earlier age. Occupational training as a part of a sequentially developed program, now not available in many school systems, could be implemented and strengthened by OVR.

2. Federal assistance for the establishment of occupational training workshops to supplement public school programs to train educable mentally retarded for job placement and independent living.

3. Federal assistance for the establishment of sheltered workshops to serve as

longtime terminal placement for severely handicapped.

4. Assistance to States for the establishment of regional institutional programs where needed. These programs would provide day-care training; strengthen training programs within existing institutional facilities by providing for competent inservice training and research personnel.

RESEARCH

1. Strengthen through increased Federal support, both basic and clinical research-

(a) Aimed at clearer understanding of causative factors in mental

retardation.

(b) Aimed at better testing methods, having as their goal more precise classification of mentally retarded patients which could in turn make significant improvement in diagnosis, management, and results.

Such support should be made more readily available both administratively and

to a broader spectrum of investigators.

Research in evaluation of educational methodology and training programs.

COORDINATION

1. Evaluate the functions of the many Federal, State, and local agencies and disciplines which provide for mentally retarded children and youth to determine whether or not a more effective organization of these efforts can be achieved.

Facilitate the exchange of information among States and between States and the Federal Government for maximum use of available information and

3. Intensify efforts to make known to the professions the present programs and sources of support at the Federal level.

Cochairmen:

Dr. Harry Selznick, director, Department of Special Education, Baltimore Public Schools, 3 East 25th Street, Baltimore 18, Md.

Dr. Mortimer Garrison, Jr., director of research, Woods School, Langhorne,

Our next report comes to us from the section on the physically

handicapped, of the workshop at Philadelphia.

That report will be made by Mr. William Page, of the Kessler Institute for Rehabilitation, of West Orange, N.J.

STATEMENT OF WILLIAM PAGE, KESSLER INSTITUTE FOR REHABILITATION, WEST ORANGE, N.J.

Mr. Page. Thank you very much, Mr. Chairman and members of the committee. Like my colleague who preceded me a few minutes ago, I wish there was some way in which we could have had you good members of this committee with us during the 2 days that my cochairman, Dr. Leon Reid, associate professor of speech education of the University of Pittsburgh, and I conducted a workshop discussion for some 66 members of the overall special education and rehabilitation team throughout our 4-State area.

I think you can understand it becomes a rather formidable task to convey to you both the climate and certainly some of the substance

of what was discussed at that time.

I would like to somewhat depart from the text of the report which is preliminary in nature that I would like to leave with the committee today, to perhaps hit some of the highlights and let you know what we were thinking about and how that thinking process developed.

The workshop committee unanimously recommended that the Federal program of rehabilitation for the physically handicapped include those that cannot now be included because they do not qualify for these services because of the severity of their disability or their failure to meet the vocational requirements.

So a considerable amount of time, then, after that decision was made, was spent on problems that arise in how to implement this type

of broadened program.

It was again unanimously agreed that some of the following problems would have to be approached directly and immediately in anticipation of any broadened program both in the field of what you might call the independent living program and also in expanded programs for the special education for the physically handicapped child.

The members of the workshop committee pointed out that the present limitations of medical and professional personnel in all specialties of special education and rehabilitation are in such short supply that current programs in both the public and voluntary fields are not meet-

ing the present demands for service.

I might say, as an aside, that as a director of a voluntary nonprofit rehabilitation center I was concerned, and there were some 14 of our colleagues throughout the 4-State area who were at our hearings, or our workshop in Philadelphia who felt that same concern, that as these good people are referred to our doors we have obligations to our community to undertake their care and treatment.

While it was pointed out that inadequate budgets and rising costs are also a powerful limiting factor in presenting and rather meeting present needs, the manpower problem is fundamental to the improve-

ment of the present services and for future expansion.

For example, here in our own State of New Jersey the vocational rehabilitation program is meeting but 1 of 6 cases requiring vocational rehabilitation services and there is a current estimated backlog of 62,000 men and women in our State, and an additional 7,800 who become physically disabled each year in our Garden State.

The Bureau of Census figures that is an ongoing survey since 1957 of the health status of our Nation, reports that one out of every seven Americans has a chronic or physical impairment, not counting the

mentally ill.

Representatives of the 16 rehabilitation programs in both centers and hospitals reported, with respect to this shortage of personnel, vacancies in medical specialties, rehabilitation personnel, in nursing, occupational therapy, speech and hearing therapy, social service, physical therapy, psychological and rehabilitation counseling.

Our authorities reported similar deficiencies in staffing their needs in both instruction of students in colleges and universities and in providing both supervisory level teachers and teachers directly for

the handicapped children and adults.

It is interesting that the directors of our schools of occupational and physical therapy give us the shocking news that not only are they not at full enrollment, but the supply of essential personnel in our work with the physically handicapped regardless of age, is actually less than it was 5 years ago.

The officials in the division of vocational rehabilitation in New Jersey and Pennsylvania reported acute shortages of rehabilitation counseling personnel both with respect to their present program and with respect to an anticipated increased load that would come through, shall we say, an expanded program in the independent liv-

ing area.

Therefore, the workshop committee recommended that the Federal Government through the Department of Health, Education, and Welfare, and the appropriate departments in the Office of Vocational Rehabilitation undertake and provide funds for an intensive program of public education and publicity to recruit an adequate supply at all levels for medical, educational, and related professional specialties required for the staffing of special education and rehabilitation services for the physically handicapped.

I might say as an aside there was considerable discussion as to how we might seize upon something as dramatic as the problem as to what do you eat with your Thanksgiving turkey that would concern our American people and dramatize their concern with their health and if we could utilize as dramatic an incident as that with respect to the needs of personnel we might get the message to the far corners

of the country.

Additional grants in aid are recommended to institutions providing training for this personnel and scholarship grants should be made available for both graduate and undergraduate levels of all spe-

cialties.

It was admitted in our discussions that both our voluntary and our present programs of Federal aid have been doing a great deal in this direction, but it was also pointed out that the scholarship aid did not reach down far enough in terms of those who wanted to enter for basic undergraduate training nor was it always available as readily as it could be for those who could not afford to drop out of employment and take full graduate training thus enriching both our instructional program at the university level and also providing more adequately for inservice training opportunities within our institutions and our service agencies.

A second consideration to accompany any expanded Federal support in special education and rehabilitation for the physically handicapped should be accompanied by a realistic appraisal of present services available, their effectiveness and a determination as to how these services might be expanded or modified to meet additional de-

mands both as to staff, facilities, or as to budget.

A good number in the group expressed the concern that this type of planning should be on a regional basis.

Mr. Elliott. Mr. Page, you have 1 more minute.

Mr. Page. Thank you, sir.

In closing I would like to say that practically a whole morning was devoted to the manner in which our Federal agencies could undertake a more adequate implementation of presentation down to the local professional levels, including our medical staffs, those who are serving our patients, our handicapped children and adults directly, concerning past research, ongoing research, and certainly a more adequate interpretation as to what the Federal program now provides.

We found there were many people in the field that did not know how to use to the full that which the law now presently provides.

Thank you very much, Mr. Chairman.

Mr. Elliott. Thank you very much, Mr. Page. (The report referred to follows:)

EASTERN ATLANTIC REGIONAL WORKSHOP REPORT SUBMITTED BY WILLIAM K. PAGE Cochairman:

Dr. L. Leon Reid, associate professor, speech education, University of Pittsburgh, Pittsburgh, Pa.

Mr. William K. Page, executive director, Kessler Institute for Rehabilitation, West Orange, N.J.

PRELIMINARY REPORT

General consideration

The Eastern Atlantic Regional Workshop Committee on Special Education and Rehabilitation conducted at Fels Institute, Philadelphia, on February 16 and 17, 1960, was attended by 66 participants representing both public and private programs of special education and rehabilitation for the physically handicapped and included representatives of all medical, educational, rehabilitation, and administrative authorities in the field of special education and rehabilitation in the States of New Jersey, Pennsylvania, Delaware, and Maryland. The Workshop Committee recommended that the Federal program for the rehabilitation of the physically handicapped include those who cannot now qualify because of the severity of their disability and their failure to meet the vocational requirement. It was unanimously agreed that any expansion of programs of special education and rehabilitation for the physically handicapped should be accompanied by plans and programs to meet the following problems:

Personnel shortage.—The members of the Workshop Committee pointed out that present limitations of medical and professional personnel in all the specialties of special education and rehabilitation were in such short supply that the current programs in both the public and the voluntary field were not meeting the present demand for service. While it was pointed out that inadequate budgets and rising costs are also a powerful limiting factor in meeting present needs, the manpower problem is fundamental to the improvement of present

services and for any future expansion.

For example, the vocational rehabilitation program in the State of New Jersey is meeting but one in six cases requiring vocational services and there is a current estimated backlog of 62,000 men and women, and an additional 7,800 persons in New Jersey become disabled every week. Bureau of Census figures estimate that one out of every seven Americans has a chronic or physical

impairment not counting the mentally ill.

Representatives of $1\overline{6}$ rehabilitation programs in centers and hospitals reported vacancies in the medical specialties and rehabilitation personnel in nursing, occupational, physical, speech and hearing therapists, social service, psychological and rehabilitation counseling. Special educational authorities reported vacancies in teaching supervisors and training personnel. Directors of schools of occupational and physical therapy reported that their schools are not at full enrollment and the supply of this essential personnel is actually less than it was 5 years ago.

Officials in the divisions of vocational rehabilitation of New Jersey, Pennsylvania, and Maryland reported acute shortages of rehabilitation counseling

personnel.

Recommendation

The workshop committee recommends that the Federal Government, through the Department of Health, Education, and Welfare and other appropriate departments undertake and provide funds for an intensive program of public education and publicity to recruit an adequate supply at all levels for the medical, educational, and related professional specialties required for the staffing of special educational and rehabilitation services for the physically handicapped.

Additional grants in aid are recommended to institutions providing the training of this personnel, and scholarship grants should be made available for both

graduate and undergraduate levels for all the specialties.

The committee felt that the public program of rehabilitation was hampered by the emphasis on numbers as the criteria for measuring results and recommended that the Federal authorities give equal importance to quality of service and the severity of the disability group involved.

A second consideration to accompany any expanded Federal support of special education and rehabilitation for the physically handicapped should be accompanied by a realistic appraisal of present services available, their effectiveness and a determination as to how these services may be expanded or modified to

meet additional demands, both as to staff, facility, and budget.

The workshop committee believed that present Federal legislation in this field was not being fully implemented at the local level through lack of understanding of its scope and application to specific problems serving the various disability groups. It recommended that the Department of Health, Education, and Welfare and other appropriate departments, intensify its program of information for those directing services to the handicapped at the state and community level to encourage a more effective use of what the law now provides.

The committee expressed concern that the existing disarticulation of programing and lack of coordination between public and private agencies would have to be corrected in order to meet the demands of those disabled not now served and certainly to undertake any expanded program in special education or rehabili-

tation.

It was felt that the present divisions of services provided by agencies serving the physically handicapped interfered with the normal continuity or "total life approach" to the problems of the severely disabled. The committee requests the attention of the appropriate authorities to the preschool and homebound handicapped child so that attention to the disability may be provided as early as possible. The workshop committee believes that Federal support must be given to the establishment and maintenance of diagnostic and evaluation services for all physically handicapped children and adults.

The committee further recommended the establishment of mobile diagnostic and evaluation teams where necessary for early case finding and for instituting

appropriate treatment and training as soon as possible.

The committee felt that the results of important research and special studies in the field of special education and rehabilitation were not made available to the medical, educational, and rehabilitation authorities affording direct services in either the manner or degree where it could improve and affect the quality and direction of programs. Leadership on the part of the Department of Health, Education, and Welfare is requested in improving the dissemination of this important material to service agencies as well as to professional training institutions.

The committee was unanimous in its opinion that special education and rehabilitation services to the physically handicapped are a right and not a privilege.

The committee recommended an increase of Federal grants-in-aid for the establishment and the maintenance of sheltered workshops for the physically handicapped. It recommended an increase of Federal appropriation to the States for the purchase of direct services from voluntary institutions providing special education and rehabilitation. Voluntary rehabilitation agencies and institutions would benefit by increased Federal appropriations to the State agencies purchasing special education and rehabilitation services by enabling them to pay reimbursable costs and to make full utilization of the voluntary services for greater numbers of disabled individuals.

The committee recommended Federal subsidy of demonstration projects and

the establishment of programs for the homebound.

While individual members of the Workshop Committee advocated compulsory health insurance through the social security system, there were others who felt the Government cannot and should not do the whole job. The opinion was expressed that the principle of Federal subsidy to stimulate community resources should be a continuing objective.

EASTERN ATLANTIC REGIONAL WORKSHOP—SPECIAL EDUCATION AND REHABILITATION STUDY, FELS INSTITUTE, UNIVERSITY OF PENNSYLVANIA, PHILADELPHIA, PA., FEBRUARY 16-17, 1960

Sponsored by U.S. House of Representatives, Committee on Education and Labor, Subcommittee on Special Education

SECTION REPORT-THE PHYSICALLY HANDICAPPED

Cochairmen:

Dr. L. Leon Reid, associate professor, Department of Special Education, University of Pittsburgh, Pittsburgh, Pa.

Mr. William K. Page, executive director, Kessler Institute for Rehabilitation, West Orange, N.J.

INTRODUCTION

The eastern Atlantic region, for the purposes of this special education and rehabilitation study, Committee on Education and Labor, U.S. House of Representatives, included only the States of Delaware, Maryland, New Jersey, and Pennsylvania. Dr. Reid and Mr. Page, cochairmen, section on the physically handicapped, invited 139 professional workers from these four States to participate in the section on the physically handicapped. On February 16-17, 1960, as a result of the official invitations, 66 professional individuals (6 from Delaware, 7 from Maryland, 14 from New Jersey, and 39 from Pennsylvania) were able to take time out from their important works to deliberate in this workshop. These 66 professional persons, because of their personal qualifications and longevity in the field, represented well the professions concerned with special education and rehabilitation in the eastern Atlantic region. The professional specialists in administration, education, medicine, physical therapy, occupational therapy, psychology, social work, from public and private agencies, were adequately represented.

For the purposes of this final report on the section on the physically handicapped, the deliberations have been divided under seven broad areas: Personnel training and recruitment, cost of medical care, cost of educational, social, psychological, and vocational rehabilitation, aid to new and/or existing programs, research, philosophy of special education and rehabilitation, and general. It must be pointed out that this workshop section considered special education and rehabilitation as overlapping and interrelated and for all practical purposes.

poses no division between the two were acknowledged.

PERSONNEL TRAINING AND RECRUITMENT

The lack of personnel in all areas of exceptionality, and in every specialty of each area was emphasized. The need for professionals to work with children and adults for each area of exceptionality is overwhelming. This need prevents the establishing of sufficient classes and programs. Also, on many occasions subtrained individuals are asked to fulfill positions for which they are not capable. Institutions training professionals in special education and rehabilitation are few and their number of graduates will never meet the existing demands. It is recommended that traineeships, fellowships, or scholarships be granted professionals in service and prospective professionals to assist in the cost of obtaining an adequate level of training from qualified institutions of learning.

A further emphasis was that, although the greatest demand is for trained professionals to work with children and adults in the schools, hospitals, clinics, and agencies, an additional need is paramount in the training institutions. The cost for the training of professionals to work with the physically handicapped is high, therefore, many qualified institutions, in order to train individuals, must receive supplementary financial assistance. It was agreed that grants must be made to training institutions for the initiating, developing, and carrying out

the program of training.

In addition, training institutions need to be encouraged and aided in the training of professors in the various specialties concerned with special education and rehabilitation. The various professionals especially concerned are: teachers, psychologists, medical specialists, speech therapists, hearing therapists,

habilitation counselors, school administrators, rehabilitation center administrators, physical therapists, occupational therapists, nurses, prosthetists, hospital administrators, and recreation therapists.

COST OF MEDICAL CARE

It was fully agreed that the usual cost to an individual for medical care in the rehabilitation process is beyond equitable limits. Because of this, increased aid for medical care is needed. Provisions should be made to reimburse public and private agencies for medical care, including: physicians' fees, drugs, transportation, special surgery, hospital care, board and room, artificial aids and appliances, and the like.

COST OF EDUCATIONAL, PSYCHOLOGICAL, SOCIAL AND VOCATIONAL REHABILITATION

It was fully agreed that the usual cost to an individual for educational, psychological, social, and vocational rehabilitation in the rehabilitation process is too great for even the person with above average income. Increased aid should be provided for such services as: rehabilitation counseling, clinical psychology, job evaluation, job placement, job training, and other similar aspects of the rehabilitation process. It was fully agreed that an adequate job adjust-ment is the real objective of special education and rehabilitation. An adequate job adjustment should be defined as the type of work a disabled client can enter into whether in a factory, office, or at home (including what is termed independent living). (It must be emphasized that the rehabilitation process for a significant number of the physically handicapped begins shortly after birth. The preschool, school, sheltered workshop, counseling, training, placement, etc. are parts of the total rehabilitation process.)

AID TO NEW AND/OR EXISTING PROGRAMS

1. The importance of the sheltered workshop for the training and employment of the physically handicapped was urgently stressed. It is generally agreed that the Federal Government should provide increased support to the establishment and operation of prevocational, evaluative, terminal, and vocational training types of sheltered workshops. The importance of this type of facility at the junior high school level through adult vocational rehabilitation was emphasized.

The workshop group suggested other programs the Federal Government should

generously support:

2. Programs for the education, training, and rehabilitation of the older adult

(old-age group).

3. Federal support should be given to establishing independent living as a criteria for providing Federal-State services for the physically handicapped. This will remove the present limitation imposed by the requirement that a disabled person be able to return to gainful employment.

4. That the Federal Government organize and finance educational, psychological, social, and medical teams to identify, evaluate, and prescribe for the physically handicapped in key geographical areas where these diagnostic services are not presently available. The purpose would be not only to serve a diagnostic and evaluative function speeding services to the physically disabled, but would also provide a demonstration and a model as to how this important task should be done.

5. That the Federal Government support the programing and production of closed-channel television for training personnel in special education and re-

6. That the Federal Government grant special support to existing private and public agencies in order that they may better meet the present demand for special education and rehabilitation services to the physically handicapped. This grant-in-aid should also anticipate the additional expenses involved in serving the vast numbers of individuals whose physical disability will fall within the independent living goal.

7. That the Federal Government sponsor and conduct a continuous nationwide program of public education and publicity for the recruitment of professional personnel required for staffing programs in special education and rehabilitation. It was emphasized that throughout the four-State area, acute shortages of professional staff placed severe limitations on meeting present needs.

RESEARCH

It was pointed out that a great amount of knowledge is available in special education and rehabilitation to date; however, the proper coordination of modern research information to professionals is inadequate. It was suggested that the Federal Government somehow devise a system for the articulation and coding of research information so that those concerned can have easy access to Federal, State, private, and individual research contributions in special education and rehabilitation.

Mandatory, of course, are more efforts in research if special education and rehabilitation are to advance significantly. Some of the types of research suggested are:

1. Investigations into the theory of learning with exceptional individuals.

2. Job analysis studies for the handicapped.

3. Investigations into the aspects of interprofessional cooperation.

4. More medical research.

PHILOSOPHY

In all provisions for the physically handicapped, the Congress and agencies concerned should be reminded that special education and rehabilitation are rights of the individual that should be provided from the moment of the identification of the disabling condition through total rehabilitation.

GENERAL

The following are some general comments and recommendations, with complete agreement by this workshop group, that have essential bearing in the provisions for the physically handicapped.

1. Liberalize the Federal laws and provisions for the physically handicapped.
2. Encourage at all levels the participation of both public and private agencies in jointly planning for and cooperating in programs for research with respect

to the physically handicapped.

3. Reevaluate the present policy that OVR cannot consider a client active until 16 years of age. This workshop recommended that no age limit be requested as certainly a large number of individuals should become clients of OVR long

before 16 years of age.

4. More support for demonstration and experimental projects in the field of special education and rehabilitation for the physically handicapped. The philosophy which requires a guaranteed result in the field of health and welfare service for the disabled is, in many cases, unduly restrictive. It was recommended that the Federal governmental agencies acknowledge calculated risk involved in supporting a purposeful research and demonstration project.

Reduce red tape.

 Eliminate current tax restrictions with respect to sheltered workshops for the physically handicapped.

7. Allow for income tax deductions for the physically handicapped.

8. The members of the workshop group were of the opinion that there are many barriers to the prompt and efficient service to the physically handicapped resulting from dislocation of services and outworn agency policies with respect to age and disability served. This problem restricts the development of sound interprofessional and interagency communication and coordination of services. It was further agreed that this is, in the main, a local problem. However, leadership and the development by the appropriate Federal agencies of more simplified lines of communication and programs of regional planning involving all agencies and groups concerned, would encourage a solution of local problems. It was further recommended that the Federal Government evaluate its present methods and policies with respect to the handling of funds, systems of communication, and designation of areas of responsibility, with the purpose of eliminating artificial but nonetheless real barriers to efficient and adequate services to the physically handicapped.

9. It was further recommended that the appropriate Federal authorities responsible for the evaluation of public programs for the disabled give equal emphasis to the quality and the severity of the disability group served as well

as to the number of cases closed.

10. It was further recommended that the Federal Government encourage the elimination of architectural barriers which prevent the physically handicapped from having normal access to places of employment, public buildings, recreational facilities, etc. It was further suggested that Federal grants for the construction of any facilities should require design features suitable for the employment and access of the physically handicapped.

Respectfully submitted by the cochairman.

L. LEON REID, PH. D.

Associate Professor, Department of Special Education,

University of Pittsburgh, Pittsburgh, Pa.

WILLIAM K. PAGE, M.A.,

WILLIAM K. PAGE, M.A.,

Executive Director, Kessler Institute for Rehabilitation, West Orange, N.J.

Mr. Elliott. Our next witness comes to us from the section of the workshop, the socially and emotionally maladjusted.

That report will be given by Dr. Elizabeth Kelly, assistant superintendent in charge of special services, 31 Green Street, Newark, N.J.

STATEMENT OF DR. ELIZABETH KELLY, ASSISTANT SUPERINTENDENT IN CHARGE OF SPECIAL SERVICES

Dr. Kelly. Mr. Elliott, and members of the subcommittee on Education and Labor of the U.S. House of Representatives, the section on which I am reporting is entitled the socially and emotionally

maladjusted.

On February 17, 1960, a workshop group consisting of three psychiatrists, three educators, two educators who are also diplomats in clinical psychology, and three from the field of rehabilitation, one a professor of education at a metropolitan university, met at Fels Institute, Philadelphia, Pa., and considered the unmet needs of children and adults who are or should be classified as socially and emotionally maladjusted.

Five areas of study were agreed upon unanimously by the committee for serious consideration. They were identification, including diagnosis and evaluation, prevention planning, including management, therapy, guidance and counseling, personnel training, research,

and sociological understanding.

In this latter phase we felt we were introducing an important part of the consideration for this committee to be related to this subcom-

mittee.

In summary, the findings of this committee concentrated on three

different aspects for reporting here today.

The incidence of the socially and emotionally maladjusted from the school point of view, the definition of social and emotional maladjustment, and then the recommendations to this committee on the unmet needs in this particular field.

The incidence, a significant number of emotionally and socially maladjusted children and adults are in need of assistance and

reeducation.

It has been reported that there are as many as 1.5 percent of children of school age who are in immediate need of varying kinds of treatment and this total number might amount to 645,000 children between 5 and 17 years of age throughout this country who need this help and assistance.

As to the definition of the socially and emotionally maladjusted, no final definition of social and emotional adjustment was agreed upon.

Operationally, the participants characterized the group under consideration as displaying consistent disturbance of affect, intellection,

and behavior under environmental circumstances which did not appear to be traumatic to individuals or groups widely considered as average.

It was understood that maladjustment in this context did not imply

mental deficiency.

For the child, the disturbance of adjustment was considered to be of sufficient severity to preclude his continuing in an unspecialized educational setting.

For the adolescent and adult maladjustment implied significant defects in economic competence and in intra and interpersonal

relationships.

This group was further characterized as excluding those whose handicap was of such severity as to require institutionalization, either

correctional or psychiatric.

The recommendations of this committee in summary are as follows: Federal support of grants-in-aid to assist local communities to overcome the devastating effects of these conditions have been recommended by this committee.

Specifically they are, first, support of outpatient clinics and residential facilities to allow for the development of new facilities where necessary and for the expansion of services in existing installations to provide diagnosis for this group of socially and emotionally malad-

justed.

Second, inservice and preservice training for all personnel customarily engaged in these programs for children and adults as school administrators, teachers, psychologists, social workers, therapists, nurses, public health and school nurses, school physicians, and rehabilitation workers.

The third involved research such as programing as to demonstration projects involving methods of school grouping, staff requirements, individual service group methods of management, support of counsel-

ing for older clients.

The second aspect of research involved basic research to determine causes and prevention of emotional and social maladjustment.

The third aspect of this research, the recommendation was expansion of sheltered workshops under OVR for this disability group.

Mr. Elliott, we felt our second recommendation here that your bill 494 might well fit into this situation in regard to this inservice and preservice training for all this type of personnel if this bill were expanded.

Also, your bill 3465, this matter of basic research might well fit

into this area, also.

This summary report is respectfully submitted by the committee on the socially and emotionally maladjusted.

Mr. Elljott. Thank you very much, Dr. Kelly. (The statement and report referred to follow:)

STATEMENT OF DR. ELIZABETH M. KELLY, ASSISTANT SUPERINTENDENT OF SPECIAL SERVICES, NEWARK BOARD OF EDUCATION, NEWARK, N.J.

Mr. Elliott and members of the Subcommittee on Education and Labor of the U.S. House of Representatives studying the unmet needs of special education and rehabilitation in the United States, the testimony which I am presenting is on behalf of all programs in special education in this country and is representative of my own thinking and convictions as one of the veteran educators in this field of work.

There are two aspects of this program in special education which require serious consideration and assistance. One has to do with the public relations aspects and involves the attitudes of lay and professional people, generally, toward the educational rights and needs of the exceptional, specifically the handicapped. My reference here is to school-age children, particularly. Yet, I do not for I minute wish to minimize the struggles of the adult handicapped to realize a life of dignity and security through independent living. My experiences and my responsibilities for many years have been for the most part with children. Therefore, I am speaking of the field which I know best.

The handicapped, or the gifted, for that matter, should not have to wait upon appeals to the generosity of men in order to obtain needed funds to sustain minimum educational programs for those of these groups. Neither should the Congress have to be galvanized into action by potent forces to effect enabling legislation to motivate educational programs for the gifted as well as the handi-

canned

Through the direct efforts of the Congress, funds should be made available to each chief State school officer for the establishment of a bureau of the handicapped in each State to determine the unmet needs of those who are exceptional or handicapped. The responsibility of this bureau would be to survey these unmet needs through a program of valid research; to publish these findings; and to promote an understanding of them among the citizens of each State. other responsibility for this bureau would be the guidance of necessary citizen action in recognition of the unmet needs of the handicapped. As the needs of the handicapped are tabulated by communities and regional areas of each State, the impact of these needs and the steps necessary to meet them in terms of new school construction, adequate staff, educational equipment and materials, and transportation should become the concern of citizens as well as educators to implement through cooperative planning. Proper physical accommodations for the education and training of the handicapped, from childhood thorough young adulthood, are as important, if not doubly so, as that planned for the average boy and girl. Funds for general school construction allotted by Congress should have a stipulated amount earmarked for programs wherever needed in special education. A third responsibility of this designated bureau would be to cooperate with the State rehabilitation commission on a coordinating team basis to chart a proper program for those handcapped who are identified early in life as requiring a special type of educational planning to insure economic and social competency in adulthood.

The second aspect of special education in which there are serious deficiencies is in the field of teacher training. Too few teachers are being trained for the program of special education. The lack of trained teachers in the areas of the mentally retarded, the physically handicapped, including those with orthopedic defects, the cerebral palsy, blind, partially sighted, deaf, hard of hearing, and the emotionally and socially maladjusted, is impeding the proper guidance and training of the handicapped. Listed with the aforementioned handicaps should be, the blind with deafness, the blind with cerebral palsy, and those with brain damage. These three additional handicaps receive little or no consideration in teacher training institutions since the educational approach to them is perplexing and difficult. Basic research is necessary to make known to those who undertake the teaching of children with double handicaps, as well as the teachers of these teachers, the necessary educational techniques and methods to be adapted in the guidance of those who present dual problems in learning and behavior.

To offer complete training and preparation in teacher training institutions, opportunity should be offered to trainees as well as to those in service, such as administrators, supervisors, teachers, therapists, school pychologists, school social workers, rehabilitation workers, school nurses, and school physicians, for a program of orientation in the understanding and management of various types of

handicapped children.

Mr. Elliott and members of the Subcommittee on Education and Labor, I am making a plea for Federal Government support to State and local communities of sufficient incentive funds so that adequate programs of special education and rehabilitation may be effective in ameliorating the conditions which now exist as to inadequate facilites and programs for the handcapped and too few teachers trained to teach them.

In order to develop and organize proper programs for the handicapped and to interest teachers to prepare and to teach in the field of special education, definite assistance from Congress, through grants-in-aid, must be made available to realize the objectives of this program. In summary, these objectives are as follows:

1. A broad administrative program of basic research pointed toward the identification of the various types of handicaps.

Administrative action to implement programs for the training of handicapped children from childhood through young adulthood, including new school construction, if necessary.

3. Teacher training programs developed on a wide front to include opportunity for clinical observation of various types of handicapped and the procedures used

in the diagnosis and classification of those in this group.

4. Cooperative planning which would blend efforts of the Division of the Exceptional in the U.S. Department of Health, Education, and Welfare with departments of special education on State and local levels; and with approved teacher training centers in the development of preservice and inservice programs, pilot studies and demonstrations, summer workshops, and national and regional conferences.

5. Development of a Bureau for the Handicapped in each State as a clearing house for all the foregoing activities and for the dissemination of necessary information to the public and the educational profession as a whole and to the

supervisors and teachers in special education in particular.

It is my judgment that the resolution introduced by Mr. Elliot (H.J. Res. 494) should be expanded to include: (1) all teachers of all areas of the handicapped with the express provision that it will be the prerogative of the U.S. Commissioner of Education to appoint members of an advisory committee to assist him in screening worthy applicants for aid under this law; (2) that all such programs should be carried out within the structure of each State Department of Education; and (3) that the Division of the Exceptional of the U.S. Office of Education of the Department of Health, Education, and Welfare, should be the Federal agency through which funds for teacher training should be approved.

SPECIAL EDUCATION AND REHABILITATION STUDY, SUBCOMMITTEE ON EDUCATION AND LABOR, U.S. HOUSE OF REPRESENTATIVES

SECTION ON THE SOCIALLY AND EMOTIONALLY MALADJUSTED

Committee:
Anthony S. DeSimone
Ruth P. Eason
Merrill T. Hollinshead, Ph. D.
Harry S. Howard, M.D.
Cochairmen:
Elizabeth M. Kelly, Ph. D.
Paul Hann, M.D.

Abraham Jacobs, Ph. D. Charles P. Jubenville, Ed. D. Paul V. Lemkan, M.D. R. F. Lee Wolf

Fels Institute, University of Pennsylvania, Philadelphia, Pa., February 16, and 17, 1960

INTRODUCTION

The committee which had the responsibility of developing a report on the unnet needs of the socially and emotiontally maladjusted discussed the problem quite thoroughly. The individual ideas and judgments of each member were projected and exchanged. The merits of each point of view were carefully weighed and sharpened until those ideas which were most accepetable met the test of every member's thinking.

The incidence of maladjustment, socially and emotionally, reported as being 1.5 percent of children of school age, was the pivot on which a program for this group was developed by the committee. The aspects of the problem deemed important to the solution of this problem before the committee involved the

following:

The identification of the emotionally and socially maladjusted.
 Prevention planning for this group, adults as well as children.

3. Social understandings of some of the factors causing emotional and social

maladjustment.

4. Training of personnel for management of the emotionally and socially maladjusted.

5. Research needed to plan clear-cut steps for the amelioration of this

problem.

The discussion of each phase is given forthwith. Subcommittees of the committee as a whole worked on the different phases and blended their findings and on the basis of them offered recommendations for implementing them.

This report is unanimous and represents the best thinking at this time of the

committee.

THE IDENTIFICATION OF THE EMOTIONALLY AND SOCIALLY HANDICAPPED

The principal case-finding agents involved in the identification of emotionally and socially disturbed persons are not necessarily the same for all age groups, although in the process the family and the medical practitioner will be important at all ages. Thus, there is need for education of the public regarding the range of normal behavior and its limits, in order that family members—and this includes most of the public—may better carry their case-finding responsibilities.

In preschool ages, instrumentalities with the best opportunity to find cases will be the general medical practitioner and the health department, through its maternal health and keep-well services. Programs are necessary to raise the sensitivity of the professionals in these areas so that this responsibility may

be efficiently discharged.

All children are required to attend school unless it is determined after due consideration that exclusion is necessary. All are subjected to this screening experience and are functionally tested in it, often over a period of years. Thus, the teacher must be able to identify children who are unable to adapt to the school experience, or perhaps more importantly, those who will be hurt by exposure to pressures inherent in the school.

With adults, the working situation offers many opportunities for identification of the emotionally disturbed although other institutions such as higher educational centers, churches, social and welfare agencies also have opportunities. Social workers, ministers, educators, and personnel counsellors will be able to increase their case-finding skill through appropriate educational programs.

One group of the maladjusted presenting great and largely unrealized rehabilitation potential offers no identification problem. This is the group of

patients discharged from psychiatric hospitals.

Identification or casefinding must distinguish between the disturbed or ill individual as against the temporarily upset person the mischievous child and the eccentric adult. For illness as for social disturbance, it must discriminate between the more and the less serious. These are delicate judgments. The margin of safety lies in overidentification. Diagnostic facilities are still far from sufficient. For the near future probably only the more serious problems can be referred for further study.

The diagnostic procedure follows identification. It will include study along many parameters: Psychiatric, medical, psychologic, and sociologic; and in many areas of possible stress: Home, school, work, and leisure time. Such a study must include an evaluation of etiologic factors, including brain or other organic

damage or disease and psychologic and social stresses.

Diagnostic study should culminate in practical recommendations for the management of those with static conditions, with the aim that behavior approach the "normal" so far as the condition will allow, and that adjustment be optimal within individual capacities. Many cases in which psychologic or social stress is primary offer a hopeful prognosis. Here relief may be achieved through psychotherapy usually involving the individual as well as his family. Social stress may be relieved through techniques of environmental manipulation available in the community or by adjustment of the educational situation, including the teacher's understanding and attitude.

Improvement in the identification of cases involves increased knowledge and sensitivity of the public, and of certain professional persons such as medical practitioners, teachers, public health personnel, clergymen, personnel counsellors in industry, and others. Diagnostic facilities which take into consideration organic, psychologic, and social pathology should be available and used to design

adjustment and treatment procedures.

PREVENTION PLANNING

Prevention planning begins with an awareness of the need for an extensive diagnostic evaluative procedure that includes physical, psychological and psychiatric examinations plus a period of observation of the current functioning of the

individual in the family, school, social, or vocational settings to determine the educational and rehabilitation services required.

Prevention planning is assisting the family-

(a) to recognize the need for early treatment;

(b) to take full advantage of every resource in the community for service to the individual and the family such as those offered by mental hygiene clinics, marriage counseling, family service agencies, parent study classes, vocational rehabilitation agencies, parent-teacher study committees.

The responsibility of the school in prevention planning is to-

(a) detect early symptoms of maladjustment;

(b) develop programs for children such as special classes, counseling and

guidance, work-study programs;

(c) motivate within the school staff a climate promoting good mental health.

Coordination of community services and resources is necessary for a total integrated approach to assist the individual to achieve his maximum functional level in society. Such community services would be those extended by health and welfare agencies, vocational rehabilitation, courts, church, and recreational facilities.

The need to develop an adequate number of trained personnel is a basic assumption underlying the services described as essential in prevention planning.

MANAGEMENT

Resources described in the prevention program have a responsibility also for management and treatment. This early prevention and treatment reduce more serious emotional or social maladjustment in later life. Coordinated educational and rehabilitation activities should be started as soon as symptoms are detected.

SOCIAL UNDERSTANDINGS

In drafting Federal legislation related to the needs of the socially and emotionally handicapped, the principle of local community involvement in all aspects of the recommended program should be scrupulously observed. This appears to be of particular importance in the areas of planning and of financing.

Recognition needs to be given to the marked cultural and socioeconomic variations present in the majority of our communities. These differences, the most significant of which may be covert, readily produce misunderstandings, tensions, and maladaptations among children as well as adults. Service programs oriented to the needs of the socially and emotionally handicapped must have sufficient intrinsic flexibility to insure recognition of these variations. In training programs of whatever nature, emphasis should be laid on the conscious recognition of these variations and on the need to take into account the value system and cultural level of individuals and groups being served.

Examples of these differences producing conflicting attitudes among socioeconomic variations may be observed between children and adults of various cultures toward children and adults of an accepted culture; and between a community with a traditionally accepted culture toward families and groups of various cultures. These attitudes are manifested not only among children and adults on neighborhood levels but also among individuals of larger spheres of activities in schools, churches, in business, civic, labor, and political activities.

Interactions of individuals and groups reflecting such opposing attitudes provide friction and a multitude of social reactions such as ostracism and rejection, creation of more than one class of citizens, ridicule and contempt, hostility and aggression, and erection of barriers to all modes of communications.

Since identification with the exemplars of prized cultural values is a significant element in all education, continuing attention should be given to the task of making explicit the broad system of ethical beliefs and traditional fidelities which actuate the majority of responsible citizens of the United States.

PERSONNEL TRAINING

The group designated as usually having the responsibility for socially and emotionally maladjusted children and adults consists of:

Teacher Guidance counselor School psychologist School social worker School and public health nurse Administrators Supervisors

Those of this group needing specialized training in the scope of this training for selected professional personnel are as follows:

Teacher:

Recognition of symptoms of emotional and social maladjustment.

Referral to proper agency.
"First aid" in a classroom situation.

University training in basic courses for proper orientation.

Clinical teacher experience or internship:

With individuals.

With groups.

Guidance counselor:

University training in basic orientation of problem.

Recognition of symptoms.

Referral to proper agency.

Recognition of interrelated roles of educational and rehabilitation counselors.

School social workers:

Training in and/or experience in field of education, generally, and of exceptional children in particular.

Psychiatric orientation on an internship basis.

School psychologist:

Clinically trained and with sufficient knowledge of and experience in educational programing and learning problems to make meaningful recommendations to teachers and administrators.

Preservice training

Proper coursts offered to provide clinical experience on college and university levels for undergraduates.

Coordination with local schools for practice on an undergraduate level. Federal grants-in-aid for scholarship on an undergraduate level.

Inservice training

Proper courses offered to provide advanced clinical experience on a university level.

Coordination with local schools for practicums on a graduate level for experienced professional personnel in supervisory and administrative roles and for those teachers studying for leadership in this program.

Federal grants-in-aid for fellowship stipends for:

Administrators School counselors

School nurses Supervisors

Teachers Marriage and family counselors

School psychologists Clergymen

School social workers Rehabilitation workers

RESEARCH

A considerable body of knowledge is available in connection with the management, care, and treatment of emotionally disturbed and socially maladjusted children and adults within the setting of a residential institution. However, when we concern ourselves with the many children and adults, still maintained in the community, whose personality problems obstruct their school learning and their later life adjustment, our goals are less well defined and we are less sure of our techniques. Thus there is an urgent need for research which will provide for us a basis for setting up effective methods of special education and rehabilitation for this disability group. The following research emphases could profitably be facilitated by cooperative endeavors involving Federal, State, and local resources; the primary responsibility for the recognition of these problems and the impetus for finding solutions should be spelled out in Federal legislation.

1. Research on nomenclature, classification, and incidence

- (a) What are the most appropriate diagnostic categories?
- (b) How extensive is the problem?

2. Research organized around demonstration projects

(a) What are the most appropriate ways of grouping the ED (emotionally disturbed) and SM (socially maladjusted) within the public school setting?

(b) What are the optional staff requirements for group programs?

(c) Which ED's and SM's can be maintained within regular groups, with supporting roles being furnished by what kinds of disciplines?

(d) What techniques of counseling and support should be used with these clients?

3. Research in prevention

(a) With early identification, can we prevent the development of unfavorable personality organization, and if so, by what means?

(b) Is there a need for aggressive casework techniques for some clients?

(c) What are the essentials of total counseling? (Planning a program of prevention, evaluation of the role of clinic, school, social agencies, religious organizations, authoritarian resources, etc. Use of the "team" concept involving several of these resources.)

4. Basic research

Research on etiology; importance of organic versus psychogenic factors; relating specific direction of treatment to etiological groupings, etc.

RECOMMENDATIONS

Federal support of grants in aid to assist local communities to overcome the devastating effects of these conditions has been recommended by this committee. Specifically, they are:

 Support of out-patient clinics and residential facilities to allow for the development of new facilities where necessary and for the expansion of services in existing installations to provide diagnosis for this group of socially and emo-

tionally maladjusted.

2. Inservice and preservice training for all personnel customarily engaged in these programs for children and adults as: school administrators, teachers, psychologists, social workers, therapists, nurses (public health and school) and school physicians and rehabilitation workers.

3. Research:

(a) Programing as to demonstration projects involving-

(1) Methods of school grouping.

- (2) Staff requirements.
- (3) Individual versus group methods of management.

(4) Supportive counseling for older clients.

(b) Basic research to determine causes and prevention of emotional and social maladjustment.

(c) Expansion of sheltered workshops for this disability group.

Workshop Report on the Socially and Emotionally Maladjusted

On February 16 and 17, 1960, a workshop group consisting of three psychiatrists, three educators, two educators who are also diplomates in clinical psychology, and three from the field of rehabilitation, one a professor of education at a metropolitan university, met at Fels Institute, Philadelphia, Pa., and considered the unmet needs of children and adults who are or should be classified as socially and emotionally maladjusted. Five areas of study were agreed upon, unanimously, by the committee for serious consideration. They were: identification, including diagnosis and evaluation; prevention planning, including management, therapy, guidance, and counseling; personnel training; research; and sociological understandings.

In summary, the findings of this committee consisted of the following:

Incidence

A significant number of emotionally and socially maladjusted children and adults are in need of assistance and reeducation. It has been reported that there are as many as 1.5 percent children of school age who are in need of varying kinds of treatment.

Definition

No final definition of social and emotional maladjustment was agreed upon. Operationally, the participants characterized the group under consideration as displaying consistent disturbances of affect, intellection and behavior under en

vironmental circumstances which did not appear to be traumatic to individuals or groups widely considered as average. It was understood that maladjustment in this context did not imply mental deficiency. For the child, the disturbance of adjustment was considered to be of sufficient severity to preclude his continuing in an unspecialized educational setting. For the adolescent and adult, the maladjustment implied significant defects in economic competence and in intra- and inter-personal relationships. This group was further characterized as excluding those individuals whose handicap was of such severity as to require institutionalization, either correctional or psychiatric.

Recommendations

Federal support of grants-in-aid to assist local communities to overcome the devastating effects of these conditions have been recommended by this committee. Specifically, they are:

 Support of outpatient clinics and residential facilities to allow for the development of new facilities where necessary and for the expansion of services in existing installations to provide diagnosis for this group of socially and emo-

tionally maladjusted.

1. Inservice and preservice training for all personnel customarily engaged in these programs for children and adults as: school administrators, teachers, psychologists, social workers, therapists, nurses (public health and school), school physicians, and rehabilitation workers.

3. Research:

(a) Programing as to demonstration projects involving-

(1) Methods of school grouping.

(2) Staff requirements.

(3) Individual versus group methods of management.

(4) Supportive counseling for older clients.

(b) Basic research to determine causes and prevention of emotional and social maladjustment.

(c) Expansion of sheltered workshops for this disability group.

COMMITTEE

Anthony S. DeSimone Ruth P. Eason Merrill T. Hollinshead, Ph.D. Harry S. Howard, M.D. Abraham Jacobs, Ph.D. Charles P. Jubenville, Ed.D. Paul V. Lemkau, M.D. Thomas W. Mulrooney R. F. Lee Wolf

Cochairmen: Elizabeth M. Kelly, Ph. D., and Paul Hann, M.D.

Mr. Elliott. Our next witness who comes to us from the speech handicapped section of the Philadelphia workshop is Vaughn Weber, speech therapist, Board of Public Education, Pittsburgh.

STATEMENT OF VAUGHN WEBER, SPEECH THERAPIST, BOARD OF PUBLIC EDUCATION, PITTSBURGH

Mr. Weber. Mr. Chairman, members of the Subcommittee on Special Education, the speech handicapped section of the Eastern Atlantic Regional Workshop was attended by 25 professional individuals representing 7 types of programs in the areas concerned.

Participants were affiliated with colleges and universities, public school therapy, State departments of government, dealing with speech handicapped, bureaus of vocational rehabilitation, hospitals, resident training programs, and community centers.

Each workshop member enjoyed the stimulating challenge of evaluating our profession, our standards, our needs, and our goals.

From the workshop, a formal report has developed and will be submitted to you within 10 days. Perhaps today, you will be interested in selected highlights of our section.

I will stand the risk of oversimplification to ease your listening task by grouping the highlights of our needs under three words. These words are personnel, programs, and publicity.

A. In considering our first word, "Personnel," we are focusing on

the basic need in our professional area.

An estimation has been made recently that over 6 million U.S. citizens have handicapping speech problems. Our estimation of incidence in the 4-State area of Delaware, Maryland, New Jersey, and Pennsylvania, is that 705,100 citizens of all ages have handicapping speech problems.

In the public schools of our workshop region, we have only 520 speech therapists. We need an additional 1,056 speech therapists to

service the schools alone.

We need additional personnel, prepared at the highest level of professional competence to provide effective early diagnosis, appropriate therapy, and/or prevention of speech disorders in all age groups.

We need to stimulate young people to enter the profession of speech

pathology.

At the present time, only 400 persons each year are being prepared

for our profession.

Our needs indicate that at least 1,500 professionally trained persons

should be graduating from training institutions.

We need to share the training and experience of our professional speech pathologists through their consultation with and advice to interested groups in related areas, government, and society.

B. Let us consider now the second word I previously mentioned, "Programs." The highlights of our needs in this category may in-

terest you.

We need to implement a program for effective early diagnosis

and/or prevention of speech disorders.

In addition to the personnel required for the program's development, we need an educational program instituted for persons in related professions to help them develop an acute awareness of the handicapping effects of speech problems, and to point up the necessity of referring persons of all ages with such problems to competent professional speech pathologists.

An educational program directed toward the general public will enable them to recognize the importance of early recognition, diag-

nosis, and therapy for persons in all age groups.

We need to maintain and upgrade the standards of our existing training programs. New training centers must be developed to prepare the needed professional speech pathologists. We need to maintain as minimum requirements the certification standards, established by the professional organization in the area of speech pathology.

We need to maintain a recognized standard of therapist-to-patient

ratio.

In the public schools, 1 therapist to 100 individuals is an accepted ratio. Among the general population, 1 speech pathologist to 50,000 persons is an accepted ratio.

We need to coordinate local services more effectively, speech therapy

programs, with related programs.

We need to develop a comprehensive catalog to include the wide range of service facilities, nationwide in scope, and periodically updated.

We need to provide adequate therapy programs for all adult persons to aid their social adjustment and ease of communication.

We need to expand and improve existing facilities through main-

taining standards of physical plants and equipment.

We need to develop additional facilities to meet more adequately

the needs of our speech handicapped citizens.

We need to further develop our programs of research, maintaining the highest standards of professional competency, in programs which are recognized as meeting the standards of our professional association.

C. Finally, let us briefly consider the third group of needs under

the heading "Publicity."

We need to inform the public about our profession of speech pathology, our services to all age groups, and our relations to other habilitative areas.

We need to inform the related professions about speech pathology, our speech pathology, our services to all age groups, and our role

in relation to other professions.

We need to inform the public and related professionals of the vital importance of early recognition, diagnosis, and therapy to speech handicapped individuals in all age groups.

Publicity, programs, and personnel, three words to categorize our

needs as a profession.

We in the profession of speech pathology, are working toward

meeting those needs.

In our formal report which you will receive, you will be interested in how far we in the profession have progressed. We hope you will consider our needs and our recommendations concerning them detailed in our report.

We further hope you will weave your considerations into the appropriate legislation to aid us in meeting our needs so that we may more effectively help the speech handicapped of our eastern

Atlantic region.

Thank you.

Mr. Elliott. Thank you very much, Mr. Weber, for your testimony.

Mr. Weber. You are welcome.

WORKSHOP REPORT ON THE SPEECH HANDICAPPED

The workshop section on the speech handicapped was attended by 25 professional individuals from the States of Delaware, Maryland, New Jersey, and Pennsylvania. These individuals gave freely of their time and participated in serious and meaningful deliberations. They represented a total of seven different types of programs concerned with the speech handicapped. Participating were individuals from colleges and universities, bureaus of vocational rehabilitation, public school speech programs, State departments dealing with the speech handicapped, hospitals, and resident training institutions.

The great need of speech handicapped individuals in the United States for rehabilitation services has been well documented on a national basis. Recently, it has been estimated that over 6 million U.S. citizens of all ages have handicapping speech problems, and in addition, more than 2 million have handicapping hearing problems. It has been estimated that during the next 10 years at least 20,000 additional professionally trained personnel will be needed to give proper

help to these people.

In the eastern Atlantic four-State area (Delaware, Maryland, New Jersey, and Pennsylvania), there are approximately 20,718,000 citizens; of this group, 705,092

are believed to have handicapping speech problems. The accompanying table indicates the extent of the problem for each of the States of interest.

Table I.—Estimated extent of handicapping speech disorders among all ages in the eastern Atlantic region (based on estimated 1959 population)

	State	Total polation	
New Jersey		3, 031 5, 930	,000 201,620

The major deliberations of this workshop group on the speech handicapped were concerned with several areas to be considered when plans are made to habilitate the speech and hearing handicapped. The statements which follow will be oriented toward a brief statement of each of the needs and recommendations developed by the workshop group regarding courses of action relative to each need.

I. EARLY DIAGNOSIS AND/OR PREVENTION

Prevention of speech disorders implies early recognition and comprehensive and differential diagnosis. This is essential because:

A. Early recognition and diagnosis, followed by appropriate therapy, prevent

speech problems from developing into more severe disorders.

B. Early recognition and diagnosis, together with appropriate therapy, prevent the numerous emotional, social, vocational, and educational problems companyed and appropriate the supervised problems.

monly developed as concomitants to uncorrected speech problems.

C. Early recognition and diagnosis make possible the beginning of appropriate

C. Early recognition and diagnosis make possible the beginning of appropriate therapy when the problem is at a relatively minor stage and presents the greatest possibility of being corrected. Ordinarily, later therapy requires a much greater expenditure of funds, time, and effort to obtain a given therapeutic benefit than does therapy at the early stages.

In order to implement a program for effective early diagnosis and/or preven-

tion of speech disorders, the following procedures are recommended:

A. Additional personnel prepared at the highest levels of professional com-

petence are needed to carry out the appropriate activities.

B. An educational program should be instituted for persons in other professions related to speech pathology (e.g., medicine, psychology, teaching, school administration, social casework) for the purpose of developing an acute awareness of the great handicapping effects of speech problems and for the necessity of referring persons of all ages with such problems to competent professional speech pathologists.

C. An educational program directed toward the general public to enable them to recognize the importance of early recognition and diagnosis of speech prob-

lems, and to utilize services of the speech pathologist.

Although early diagnosis and recognition may be thought of as applying primarily to children, the same principles should be applied to adults who acquire speech problems. Among the more serious problems of this type are those which result from laryngectomy, cardiovascular accidents, traumatic injuries, effects of polio and multiple sclerosis.

II. RECRUITMENT AND TRAINING OF SPEECH PERSONNEL

In order to carry out the early recognition, and diagnosis, and to provide therapy for persons of all ages, there is a pressing need now for more personnel. At the present time approximately only 400 persons are being trained each year in this country in speech pathology. Indications are that the rate should be at least 1.500 professionally trained persons per year graduating from training institutions if the Nation is to be provided with the professional personnel needed within the next 10 years. Table 2 indicates the immediate need for speech specialists in the public schools of the eastern Atlantic region.

Table 2.—Estimated immediate need for speech specialist in the public schools of the eastern Atlantic region

State	Total	Total now	Additional
	required	available	needed
Delaware	26	11	15
	300	100	200
	1 500	1 59	1 441
Pennsylvania	750	² 15 350	400

¹ Full time.

In order to stimulate young people to enter the field of speech pathology as a profession the necessary professional training must be made available to An effective method of recruiting student speech pathologists is to institute a large-scale program of financial aid to such students. Although competence in speech pathology requires graduate level training leading to advanced academic degrees, effective recruitment should begin at the undergraduate level. In other words, financial aid in the form of scholarships and/or fellowships should be made available at both graduate and undergraduate levels. In the four-State area considered by this workshop, an estimated 1,056 additional speech therapists are needed in public schools alone. Although the cost of academic training varies markedly from institution to institution, it is estimated that the usual costs are between \$2,000 and \$3,000 per year for the academic training of students in the field of speech pathology. mate is the cost to the students, and does not necessarily include support for the training program granted by the State governments to universities and colleges or by foundations supporting private training institutions.)

The workshop committee recommends that a scholarship or fellowship program be instituted which considers the above estimate as the magnitude of financial aid to competent students, and should be on a graduated scale related to level of academic training.

A further technique in the area of recruitment, which is believed to be effective and is hereby recommended by the workshop group, is that of wide scale publicity of the field of speech pathology, recognition by all departments of government of speech pathology as a profession, and description of the profession of speech pathology in official publications, manuals, etc.

A concomitant to stimulating and facilitating students to embark on a program of professional preparation in speech pathology is the need to assist professional educational programs which provide the appropriate education to these student speech pathologists. Specifically, the workshop group recommends that a program of grants directly to academic institutions for the purpose of completing, upgrading, or enriching their programs of study be carried on.

In the past a number of Federal departments and agencies have carried on, and are still carrying on, programs of grants to assist research, and fellowships in the field of speech pathology. Although the workshop committee does not at this writing see a specific problem in the manner in which the research and other funds have been dispersed in the past, it is recommended that financial assistance be directed only toward capable students and be of assistance to training institutions which either in the past have demonstrated a high-quality program or which can be upgraded to meet recognized standards of academic and professional training, and research.

III. STANDARDS OF CERTIFICATION

At this writing there is a diversity of standards for certification in schools and diversity of standards of recognition for persons trained in the field of speech pathology. Any Federal legislation in the area of speech pathology should include guarantees that persons being prepared in the field and who become recognized to practice speech pathology meet at least the minimum requirements as established by the professional organization in the area of speech pathology.

Departments or agencies of the Federal Government dealing with the speech handicapped should have a continuing program of receiving consultation and

² Part time only.

guidance from the speech pathology profession in the implementation of matters dealing with the speech handicapped. This plan applies not only to standards of certification, but to standards of training programs, research efforts, etc.

IV. THERAPIST-TO-PATIENT RATIO

It is vital that the number of patients being seen by speech personnal at any time be such that effective diagnosis and/or treatment can be done. Frequently the speech specialists are faced with the demand of treating very large numbers of children or in other ways have too great demands made upon their services.

Any legislation which influences the caseload of persons in the fields of speech pathology should attempt to guarantee that the efforts of the speech specialist are not diluted. A recognized standard is that in the public school situation 100 individuals is a maximum caseload for a full-time therapist. Among the general population (all ages) available evidence indicates that 1 speech pathologist should be provided for each 50,000 persons in addition to the school population.

It is recognized that geographic area, type of patient handled, and therapeutic needs should influence the ratio of speech pathologist to patients; however, the above represents a meaningful guide for determining such ratios.

V. COORDINATION OF LOCAL SERVICES AND FINDING OF AVAILABLE LOCAL FACILITIES

Throughout the geographic area considered by this workshop there are many agencies, bureaus, offices, clinics, etc., which have services of benefit to the speech handicapped. These may be specific speech therapy programs or they may be other programs which are directly related to the welfare of the speech handicapped individual.

In the past numbers of State departments, as well as private and other agencies, have prepared listings of the various services available. However, such listings have been for only relatively localized geographic areas, for only some of the services available, and typically have not continued beyond the initial effort.

Speech pathologists as well as other professional workers need to coordinate their efforts and to make maximum use of the various facilities available. This need is not only true for patients within a given localized area but also applies to distant geographic areas. In our mobile society individuals frequently change residence, and typically it is difficult for the professional worker to refer the patient to an appropriate service in the area of his new residence.

In order to facilitate the continuing services for patients who change residences and in order to make maximum use of the available facilities, as well as to facilitate the coordination of various services for the speech handicapped, it is recommended that a comprehensive cataloging of services be carried out and be made generally available. Such a catalog should include a wide range of service facilities which bear upon the welfare of the speech handicapped individual, should be nationwide in scope, and be on a continuing basis so that the catalog may be updated periodically.

VI. ORIENTATION OF ALLIED PROFESSIONAL FIELDS AND OF VOCATIONAL TRAINING PERSONNEL TOWARD SPEECH PATHOLOGY

The speech pathology profession recognizes that it cuts across numerous professional areas. However, for the speech handicapped individual the speech pathologist most often is and should be the center about which his rehabilitation program revolves. Other professional areas contribute materially to the re-habilitation of the speech handicapped individual, and not infrequently one of the other professional individuals is the first to be in a position to detect a handicapping speech problem. Thus these other professions (for example, nursing, social workers, physicians, dentists, psychologists) need to have a basic orientation in the recognition of speech disorders and of the necessity for referring a speech handicapped person to the speech pathologist. In addition, vocational training in various trades and technical skills are given by specialists in these areas to the speech handicapped. Such teachers need to have an awareness of the importance of the speech disorders and an understanding of the speech handicapped individual.

Although at the present time this need is met in part, in numerous instances it is not.

This workshop section recommends that there be established additional workshops and inservice training programs for members of other professions and/or persons engaged in teaching vocational skills to the speech handicapped, so that the end result may be more effective rehabilitation for the speech disordered person.

VII. INDEPENDENT LIVING

Among the adult population, particularly the aging but including younger adults, adventitious speech disorders are becoming more common. Existing regulations dealing with the vocational rehabilitation of adults frequently prohibit agencies from providing service to patients who present a poor prognosis for future employability. However, adult patients with a poor prognosis for full- or part-time employment can and should receive the benefits of rehabilitation Such assistance improves the social-emotional adjustment of these patients and will make it possible for the patient to live on at least a semi-independent basis. As a result, a member of the household who no longer needs to care for the patient can be released for gainful employment, or special daily care need not be continued. It is recommended that the existing criteria for eligibility for rehabilitation services be liberalized so that they will admit speech therapy to individuals who, although not independently employable, can profit from training in the communication skills. The practical result of this liberalization will be seen not only in the patients themselves but in members of their families and associates.

VIII. RESEARCH

The speech profession, although relatively young, has been actively engaged in research for at least the past 30 years. This research has contributed materially toward the understanding of the speech handicapped and methods for their rehabilitation. However, as in many fields of human endeavor, there is a continuing need for research as we gain increased understanding and discover additional prospects for areas of future investigation.

Continuing research at all levels is necessary for the growth of the speech profession; the results will be reflected as better rehabilitation service to the

speech handicapped.

The present efforts of a number of governmental agencies which support research related directly or indirectly to speech pathology should be continued and fostered. The workshop group did not undertake outlines of needed areas of speech pathology. However, it is recommended that the publication "Research Needs in Speech Pathology and Audiology," prepared by the committee on research of the American Speech and Hearing Association with support and cooperation of the Office of Vocational Rehabilitation and the Veterans' Administration, be used as a guide when consideration is given to areas of research to be supported by Federal legislative action.

IX. FACILITIES

Throughout the eastern Atlantic region there exists a number of hospitals, universities, and schools which contain suitable facilities for corrective work with the speech handicapped. However, frequently it is difficult to incorporate into buildings the necessary facilities. This is true for hospitals, clinics, universities, and public schools. Too often administrators sacrifice speech pathology facilities in order to conserve construction costs. Thus the speech handicapped cannot be served in appropriate facilities, although facilities would materially benefit their therapy programs.

A study program is indicated to determine not only the status of existing physical facilities for diagnosis and treatment of the speech handicapped, but also to project the exact needs of facilities for dealing with this handicap. In view of the common failure of program administrators to incorporate special speech facilities in their building plans, it is recommended that wherever possible legislation encourage, by appropriate methods, the establishing and equipping of corrective speech facilities. This may be in the form of offering special financial inducements for the addition of such facilities to existing buildings or to including the facilities in new building plans. This should be available not only to hospitals and clinics but also especially to public school facilities.

In addition, the more extensive use of facilities should be encouraged, especially during the summer months when facilities such as public schools are not

in use.

Further, in selected geographic areas there are no speech diagnosis and treatment facilities available. Therefore, a part of the study of this problem should include recommendations for establishing such facilities where they do not now exist in any form.

X. OVERLAPPING SERVICE

Although the workshop group, at this time, does not desire to specify examaples of overlapping or duplicating services, the group wishes to go on record as being against such duplication. Legislation which will influence programs or facilities for the speech handicapped should avoid costly and unnecessary duplication, although it should in no way inhibit the establishment of facilities and programs as needed.

XI. PROFESSIONAL ADVICE

When considering legislation dealing with the speech handicapped, legislators should at all times have the full benefit of advice and counsel of those whose lifework is with the speech handicapped. This, we believe, contributes materially to the effectiveness of legislation as it relates to the rehabilitation of the speech handicapped. Although members of other professions may be able to make material contributions to this type of legislation, persons actually engaged in speech pathology are the best qualified to give guidance and counsel on these matters. It is recognized that in many instances such counsel has been obtained, and the activities of the present workshop demonstrate this type of counseling in action.

It is strongly recommended that procedures such as the present workshop activities as well as the establishing and use of the advisory committees, individual consultants, and the employment of agency staff members specific to

speech pathology be continued.

February 16-17, 1960

Such continued consultation is especially evident in view of the rapid growth of the profession of speech pathology, the rapidly increasing fund of knowledge in the area, and needs of our citizens for the types of service offered by the speech pathologists.

THE SPEECH HANDICAPPED SECTION PARTICIPANTS

Eastern Atlantic Regional Workshop Fels Institute of Local and State Government Philadelphia, Pa.

COCHAIRMAN

Vaughan Weber, B.S., M.Ed., speech therapist, Pittsburgh Board of Public Education and Allegheny General Hospital, Pittsburgh, Pa.

Bruce M. Siegenthaler, Ph. D., associate professor of clinical speech, the Pennsylvania State University, University Park, Pa.

CORECORDERS

Jerald E. King, B.A., director, speech and hearing services, Lawrence County Public Schools, New Castle, Pa.

Margaret McCausland, B.S., M.A., special assistant in charge of speech correction to the director of special education, Philadelphia Public Schools, Philadelphia, Pa.

PARTICIPANTS

Martha Badick, B.S., M. Ed., speech therapist, Board of Public Education, Wilmington, Del.

Frank P. Bakes, Ph. D., associate professor of psychology, University of Pennsylvania, and director, Speech and Hearing Center Hospital of University of Pennsylvania, Philadelphia, Pa.

Maude O. Brungard, B.S., M. Ed., supervisor of speech and hearing, Center County Public Schools, Bellefonte, Pa.

C. Robert Dean, M.D., medical consultant, Office of Vocational Rehabilitation,

region II. John C. Fisher, B.A., M.S., speech therapist, Delaware State Board of Health,

Dover, Del.

George W. Gens, Ph. D., professor of special education and director of curriculum for the handicapped, Newark State College, Union, N.J.

Anne Gray, B.S., M.S., director of speech and hearing, D. T. Watson Home for Crippled Children and Laughlin Children's Center, Sewickley, Pa.

Murray M. Halfond, Ph. D., director of speech and hearing center and associate professor of speech, Temple University, Philadelphia, Pa.

Alonzo Hall, B.S., M.A., head, speech therapy department, Harmarville Rehabilitation Center, Pittsburgh, Pa.

Rev. John P. Hourihan, S.T.L., Department of Special Education, Archdiocese of Newark, N.J.

Alan B. Jones, state supervisor, Pennsylvania Bureau of Vocational Rehabilita-

tion, Harrisburg, Pa. Jack W. Birch, Ph. D., chairman, department of special education, University

of Pittsburgh, Pittsburgh, Pa.

Donald F. Maietta, Ph. D., director of speech and hearing clinic and professor of speech correction, Bloomsburg State College, Bloomsburg, Pa.

Michael Marge, Ed. D., associate professor of speech, Montclair State College,

Upper Montclair, N.J. Jack Matthews, Ph. D., chairman, speech department, University of Pittsburgh, Pittsburgh, Pa.

Majorie A. Scanlon, B.A., director of speech program, Mt. Lebanon Public

Schools, Pittsburgh, Pa.

Harold Scholl, Ed. D., chairman, department of speech, Montclair State College, Upper Montclair, N.J. Jean Stifler, M.D., chief, Division for Crippled Children, Maryland State De-

partment of Health, Baltimore, Md. Louis Stoia, M.A., speech and hearing consultant, Montclair Board of Education,

Montelair, N.J. Alice V. Stone, B.A., M.A., Ph. D., supervisor of services in speech, hearing, and

vision, Bucks County Public Schools, Doylestown, Pa. Elizabeth Walpole, B.A., director of speech center, Cooper Hospital, Camden,

N.J., and consultant, Westville School System, Westville, N.J. Mr. Elliott. Our next witness is Dr. Gordon Connor, executive

director, Greater Pittsburgh Guild for the Blind. Dr. Connor comes to us from the visually handicapped section of

the Philadelphia workshop.

STATEMENT OF DR. GORDON CONNOR, EXECUTIVE DIRECTOR, GREATER PITTSBURGH GUILD FOR THE BLIND

Dr. Connor. Mr. Chairman, members of the committee, the section of the Philadelphia study which was concerned with the visually handicapped were 28 in number, and they seemed to divide naturally between the field of education and rehabilitation.

So, in the course of their 2-day study, they separated, each working

in a different section of the same room, with occasional joint meetings. I am going to try to highlight the findings of each section which was presented as the joint findings of this particular section and attempt to highlight in 2 or 3 minutes for each section and then respectfully request that the committee accept the written report of this group.

Mr. Elliott. Without objection, the written report of the group on the visually handicapped will be made a part of the record imme-

diately following the oral presentation of Dr. Connor.

Dr. Connor. The subject group dealing with the background of rehabilitation generally pointed up the need for a reexamination of the availability of vocational rehabilitation services prior to age 16, feeling that oftentimes this prevents an individual from timely effective services.

This particular group was also concerned with the pending independent living legislation and felt among other things, that there should be separate programing and staffing, else this particular bill seek to encourage the losing of some otherwise hard-core VR cases.

The section was also interested in the provision of specific reader services to the professionally placed blind person for a minimum of 1 year on a post-training basis, feeling that, for example, the blind person who is placed as a lawyer during his first year or so of employment would find economic hardship and have good use for reader service in addition to the maintenance and other services at that time.

This rehabilitation section was also concerned with the provision of tuition because there seems to be a growing tendency among the several States to place tuition on a needs basis and it is recommended that it be made obligatory upon the several States to provide this service without the individual being required to establish economic

need.

In the area of public housing this section of the workshop recommended that due consideration be given to the matter of housing on behalf of blind persons as an unmet need, developing this along the

lines of either a preferential or a quota system.

This section also gave consideration to the combined problem of geriatrics and blindness, showing vital concern with the problem of the aged blind person and the need to bring adequate services to this group.

I am fully aware of the fact that the problem of the aged is already

of vital concern to the Congress.

The group suggestions that adding the disability of blindness seri-

ously enhances the problem and could stand special study.

The group concerned itself with title II of the Social Security Act, indicating that in some instances there is an element of compulsion toward rehabilitation and the withdrawal of OASI benefits with the refusal to accept rehabilitation and in those instances where this could produce an economic penalty upon the individual or where it might possibly force the individual to stand in either health or physical jeopardy, it is felt this should be interpreted as good cause for the refusal of such services.

The educational grouping of this section pointed up that legislation similar to Public Law 85–926 for the training of both undergraduate and graduate levels for teachers and anciliary personnel in general be provided or that consideration should be given to making funds available for in-service training programs, college or university summer sessions, as well as full-time college or university enrollment.

The educational grouping fully endorsed the recommendations made by the American Printing House for the Blind at the Atlanta, Ga.,

hearing.

Also, that additional Federal aid should be made available to the State Department of Education and the schools for the blind for the purchase of materials and for equipment necessary to prepare recorded books and hand copied braille or large type books, including the provision of funds for proofreading of such materials by qualified individuals.

Increased subsidy should be given to the American Printing House for the Blind in order to provide additional staffing as pointed up in earlier testimony, additional staffing for the plastic plate braille reproduction process, for the preparation, continuance, and dissemination of information concerning all available hand copied or pressed braille materials and sound recording.

The group recommended that additional funds be made available to the Library of Congress, division for the blind, to help provide for

the following.

You were talking of book reproducers equipped with variable speed motors, more effective distribution of talking book machines, supply of additional and more receptive selections of materials, particular items which would be helpful to the college student and to the professionally employed.

Adequate information as to what titles are available in both pressed

and hand copied braille and sound recordings.

The group also suggests that legislation should be enacted to provide Federal funds for the establishment of regional residential diagnostic centers for the multiple handicapped with defective vision.

Funds should also be made available for the purpose of services

from these or from any qualified facility already in existence.

Skipping along to highlights here, the group did work on bringing to the attention of the committee the need for Federal funds to provide the schools with equipment and teaching personnel for the expansion of prevocational training programs for visually handicapped children.

Serious consideration should be given to the possibility of securing Federal support in order to make available actual talking book repro-

duced records and other sound devices.

The study group endorsed the present method of the committee in seeking grassroots information and we feel certain that within the limited time allowed in the workshop that there are many things that have not been touched upon which hopefully will be touched upon in the other regional study groups and in the hearing.

With that, Mr. Chairman, I would respectfully ask if I may submit

this for the record, and thank you very much.

Mr. Elliott. Thank you, Dr. Connor.

Without objection, Dr. Connor's statement will be made a part of the record at this point.

(The statement referred to follows:)

SUMMARY REPORT OF THE EASTERN ATLANTIC REGIONAL WORKSHOP ON SPECIAL EDUCATION FOR THE VISUALLY HANDICAPPED, PHILADELPHIA, FEBRUARY 16 AND 17, 1960

The Workshop on Special Education for the Visually Handicapped considered the following to be major problems in this field on which it felt that changes in or extension of existing Federal legislation or introduction of new Federal

legislation would effect improvement in services to be rendered:

1. Legislation similar to Public Law 85-926 for the training at both graduate and undergraduate levels of teachers, supervisory and administrative personnel, and auxiliary educational personnel, such as, psychologists, house parents, social workers, and mobility instructors. Consideration should be given to making funds available for in-service training programs, college or university summer sessions, as well as for full-time college or university enrollment.

2. The Workshop participants fully endorse the recommendations made by the

American Printing House for the Blind at the Atlanta, Ga., hearings.

3. Additional Federal aid should be made available to the State Departments of Education and the schools for the blind for the purchase of materials and equipment necessary to prepare recorded books and hand-copied braille or largetype books, including provision of funds for the proofreading of such materials by qualified individuals.

- 4. Increased subsidy should be given to the American Printing House for the Blind to provide additional staff for the plastic plate braille reproduction process, and for the preparation, continuance and dissemination of information concerning all available hand-copied or pressed braille materials and sound record-
- 5. We recommend that additional funds be made available to the Library of Congress, Division for the Blind, to help provide for the following:

(a) Newer talking book reproducers equipped with variable speed motors. (b) More efficient and adequate distribution of talking book machines,

(c) Supplying additional and more representative selection of materials, particularly items which would be helpful to the college student and the professionally employed.

(d) Adequate information as to what titles are available in both pressed and

hand-copied braille, and sound recordings.

6. Legislation should be enacted to provide Federal funds for the establishment of regional residential diagnostic centers for the multiple-handicapped with defective vision. Funds should also be made available for the purchase of services from these, or from any qualifying facility already in existence.

7. New legislation should also be enacted to provide funds for the establishment of regional treatment centers for emotionally disturbed visually handicapped children, requiring residential care, and services should be available to

the parents.

8. New or extended legislation is needed so that services now available for physical restoration to clients under vocational rehabilitation and the crippled children's program may be provided to any visually handicapped individuals needing such service.

9. Federally supported research programs which would be of chief concern

to special education for the visually handicapped would include:

(a) Exploration of types of materials for individuals having partial vision, i.e., print of varying sizes, magnifiers, more effective recording materials.

(b) Continued and increased support for studies on causes and prevention of blindness.

(c) Social and educational implications of specific eye defects.

(d) Development of better diagnostic and evaluation services and tests for visually handicapped children.

(e) Methodology for training brain-injured visually handicapped children. 10. Federal funds to provide the schools with equipment and teaching personnel for expansion of prevocational training programs for visually handicapped

11. Provision for additional Federal income tax exemption to be extended to

include any blind dependent.

12. Publication of a digest of new legislation and regulations and pertinent activities covering all Federal programs for the handicapped to be distributed

to individuals working in the various fields.

13. Serious consideration should be given to the possibility of securing Federal support to make available talking book reproducers and records, other sound recordings, large print and other special materials and devices for those whose visual activities exceed the legal definition of blindness and yet who, because of their visual limitations, require such materials.

Those who attended the Workshop for the Visually Handicapped on February

16-17, 1960—Rehabilitation Section:

Norman Yoder, Ph.D., cochairman, commissioner, State office for the blind,

Harrisburg, Pa.

George E. Burck, State Council of the New Jersey Organizations of the Blind. Gordon E. Connor, Ph.D., director of rehabilitation, Greater Pittsburgh Guild for the Blind, Pittsburgh, Pa.

Frank J. Cummings, Ph.D., Delaware Commission for the Blind, Wilmington,

Del. Frank E. Gable, Philadelphia Working Home for the Blind, Philadelphia, Pa. Phillip N. Harrison, Pennsylvania Association for the Blind, Harrisburg, Pa. Mrs. Phillip Harrison, Pennsylvania Association for the Blind, Harrisburg, Pa. Howard T. Jones, Delaware Commission for the Blind, Wilmington, Del. Joseph Kohn, New Jersey State Commission for the Blind, Newark, N.J. Marion McVey, assistant regional representative (region 2), Office of Rehabili-

George F. Meyer, New Jersey State Commission for the Blind, Newark, N.J.

Henry G. Roberts, American Foundation for the Blind, New York City, N.Y.

John Taylor, National Federation of the Blind, Washington, D.C.

EASTERN ATLANTIC REGIONAL WORKSHOP ON THE VISUALLY HANDICAPPED

Cochairmen: Dr. Alton Kloss, superintendent, Western Pennsylvania School for the Blind, Bayard at Bellefield, Pittsburgh, Pa., and Dr. Norman Yoder, director, State commission for the blind, Harrisburg, Pa.

Reporting to the Subcommittee on Special Education at congressional hearings: Dr. Gordon Connor, executive director, Greater Pittsburgh Guild for the

Blind.

The workshop dealing with the visually handicapped individual and the problem of the unmet needs in this area analyzed a series of propositions and submit for congressional consideration the following recommendations.

These recommendations are submitted with no estimate of potential cost because, to do so would involve a lengthy and more detailed study than the workshop time permitted. However, it is the consensus of opinion presented that the recommendations contained herein would not materially require budgetary increase.

It is our general thought that a more expedient use of moneys already appropriated would cover the basic increases stemming from these recommenda-

tions.

PROVISION OF REHABILITATION SERVICES PRIOR TO THE AGE OF 16

The workshop committee concerned itself with the provision of vocational rehabilitation services prior to the age of 16. While many State agencies assume this responsibility under "diagnostic procedures," nevertheless there is little, if any, basis for the provision of case services prior to that age.

Both special education adherents and vocational rehabilitation adherents believe that it is important for case services on a purchased basis to be made available as early as the freshman or sophomore year in high school in order to correct, to alleviate and/or to strengthen those areas of physical disability which may be a barrier to later sound rehabilitation.

The workshop committee in no way recommends that because work begins at an earlier age than that of 16, that private, public, and/or other school authorities be relieved of their respective responsibilities in carrying out those elements usually assigned to the educational facility.

We recommend that for clarity purposes, congressional or administrative action be taken to either amend the existing legislation or clarify the regulations issued pursuant thereto for the purposes of obtaining these objectives.

INDEPENDENT LIVING

The workshop is not recommending any specific piece of legislation now pending before the Congress on the subject of "Independent Living." However, it feels that the provisions in this legislation will furnish services not now

available to a great number of individuals who, because of the complexity of their disabilities are not feasible for vocational rehabilitation.

Recommendations to broaden existing legislation to include the philosophy of independent living, are submitted, but it is also suggested that some definitive

guidelines be included in any legislation on this matter.

These guidelines are: (1) that under no circumstances should the impetus to job finding (placement) be lessened because of opportunities presented under independent living legislation; (2) that in order to bring about a more definitive approach to placement, the Congress require uniform standards for measuring rehabilitation nationally. Such standards may include a minimum earned income or other factors. (3) that a separate staff and programing be applied to the independent living program.

The workshop believes that there is an inherent danger in approaching such legislation without specific guidelines to carry out the intent and at the same time to preclude a disregard of the necessity to find jobs for the employable

blind.

PROVISION OF READER SERVICES

The committee recommends that the provision of reader service be removed from any needs test, since the necessity for this service is an essential part of the educational process because of blindness.

In addition, the workshop recommends that reader service be provided on a

posttraining basis for a minimum of 1 year.

This becomes essential to protect the already heavy investment in the education of the blind person. Experience demonstrates that without the provision of adequate posttraining reader service a blind person may find it impossible to succeed professionally in competition with a sighted individual.

PROVISION OF MAINTENANCE AND OTHER SERVICES

The workshop examined the necessity for expanding that phase of the rehabilitation program dealing with postplacement services, namely, maintenance and the provision of other services.

At the outset, it does not seem reasonable that 30 days of maintenance is adequate in those instances when an individual expects to become self-employed

or if he is working in a contract situation.

The attorney, the chiropractor, and those in similar occupations, while they may open a practice seldom, if ever, in the first 30 days have an adequate income to maintain their office and to maintain themselves. We, therefore, believe that administrative interpretation or legislative amendment should remedy this situation.

Moreover, because employment opportunities frequently require the rental of space, the rental or subsequent purchase of equipment, that the provision of these services should be available after the initial placement has been made.

The workshop further recommends that there be a realistic definition of "a reasonable period of time" to be established as 1 year, rather than 30, 60, or 90 days.

PROVISION OF TUITION

Because there is a growing tendency among the several States to place tuition on a needs basis, it is recommended that it be made obligatory upon the several States to provide this service without the individual being in economic need.

The workshop takes cognizance of the fact that under current Federal legislation the needs test is not required, but we also take cognizance of the fact that budget officers within the several States are forcing rehabilitation agencies to apply such needs tests in increasing numbers.

PUBLIC HOUSING

The workshop recommends that due consideration be given to the matter of housing on behalf of the blind as a basic unmet need. While it may not be within the purview of this specific committee of Congress to consider this problem, we feel that it is necessary to call it to congressional attention, for adequate housing is the basis on which sound and long-range rehabilitation of an individual can be accomplished.

The workshop in examining this problem suggests that either a preferential or quota system may be considered on behalf of the blind in public housing authori-

ties in order to remove these individuals, because of economic necessity, from blighted or slum areas.

GERIATRICS AND BLINDNESS

The workshop personnel is vitally concerned with the problem of the aged blind person and the need to bring adequate services to this group. Recognizing the basic principle that the problem of the aged is already of vital concern to Congress, we suggest that adding the disability of blindness seriously enhances the problem and, therefore, should, as a result of this study, require special mention.

In general, it is the feeling that the basic principles in legislation now pending before Congress afford an initial step in providing these services to the

aged blind, as well as to other older groups of our citizens.

The workshop strongly recommends that provision be made to bring knowledge from the field of geriatrics and the field of blindness together for the advantage of the aged blind population.

TITLE II. SOCIAL SECURITY ACT

An examination of the present provisions of title II of the Social Security Act clearly indicates that there is an element of compulsion which is both inequitable and dangerous. It does not seem realistic to the workship personnel that sound rehabilitation would be based upon the requirement that an OASI recipient accept vocational rehabilitation or risk losing his disability payment.

We recognize that title II does provide limited exceptions to this concept. However, there are instances available that blind individuals were required to accept employment with less remuneration that their OASI disability payments, with the end result that an actual financial hardship was worked upon

the person.

It is, therefore, recommended that the rule requiring the OASI recipient to submit to rehabilitation, except for "good cause" be more liberally interpreted in order that the individual not be placed in a position of: (1) economic loss or penalty, or (2) physical or health jeopardy. The blind person should receive every encouragement to accept rehabilitation services when practicable.

RANDOLPH-SHEPPARD ACT

The workshop personnel recommends that the provisions of the Randolph-Sheppard Act be strengthened to preclude the continuing encroachment of vending machines on Federal property, thus materially reducing the income to blind vending stand operators and more especially, in certain instances, making the business so unprofitable that the stand location needed to be terminated.

Secondly, it is the committee's recommendation that this act be broadened in its scope to permit "a snack bar arrangement," rather than the present con-

cept of a "dry stand," on such Federal property.

Thirdly, because there appears to be a continuing problem of policy development at the Federal level on an interdepartmental basis in the securing of vending stand sites, we recommend that some method specifically outlined for appeals be adopted and that such a board have a final decision as to the advisability and feasibility of the vending stand location, and that the decision of this appeals body be binding upon Federal bureaus, departments, agencies, etc., as well as the State agency making that appeal.

PROFESSIONAL PLACEMENT OF THE BLIND

The committee believes that it is incumbent upon them to recommend endorsement of the present activities instituted by Services for the Blind, Office of Vocational Rehabilitation, in developing a teachable body of knowledge regarding placement opportunities for the blind in the professions. This study as it is now proposed will, the committee believes, open up an entirely new and remunerative field of employment for trained blind individuals. When necessary it is hoped that the Congress will consider appropriate legislation on certification, licensing, and boarding when such action will not contravene State prerogatives.

RESEARCH

The workshop endorses research activities now in process on behalf of the blind, but the committee views with regret a number of research projects which

appear to have been undertaken without sufficient examination and thought as to their practicality. The study group is also vitally concerned with the tendency to shift emphasis in certain research areas to the exclusion of necessity of product of the study of the

sary study of problems related to blindness.

We cite only one example to illustrate this point; namely, that there has been a decrease in the moneys expended by the Institute on Neurology and Blindness for the latter phase of the work. Ophthalmological research is vital to the prevention and to rehabilitation of a large segment of our present population.

We endorse the philosophy of research as a means of bridging existing gaps in needed services to the blind.

COORDINATION OF SERVICES FOR THE BLIND

It is apparent that the present study and series of hearings already points up the need for coordination of services for the blind at the Federal level. While it would appear to be administratively impossible to bring all segments of Services for the Blind together in a single administrative unit, it is apparent to the Workshop Committee that there has been a decided lack of coordination, communication, and transmittal of vital information which would have been of material benefit to the State agencies, private agencies, and organizations of and for the blind.

STRENGTHENING ADMINISTRATION

The group was of the opinion that by expanding the consultative function of the central office, Services for the Blind, Office of Vocational Rehabilitation, more effective work could be done with the State agencies, private agencies, organizations of and for the blind, and this could be achieved by some slight additions in and sufficient budget increase to enable the office to carry out this enlarged activity nationally.

SUMMARY

The study group endorses the present method of seeking "grass roots" information for the committee's consideration. We feel sure that within the limited time permitted this workshop has not examined all of the unmet needs of the blind. We do, however, feel that the time allocated to us gave the group of educators, rehabilitation personnel, and organizations of and for the blind an opportunity to examine, to evaluate, and to recommend for the committee's consideration certain steps to alleviate the condition of unmet needs.

(The following statements were submitted for the record:)

STATEMENT OF CONGRESSMAN PETER W. RODINO, JR., A REPRESENTATIVE IN CONGRESS FROM THE STATE OF NEW JERSEY

Mr. Chairman, I want to thank the committee for the opportunity to express

my interest and concern in this vital matter.

Until comparatively recently, the handicapped individual had little or no productive role in society. He was usually a burden both on the public and on himself, and if he was severely handicapped he could not hope to find, in life, any substantial fulfillment.

Now the picture has radically changed. Both in the areas of physical disability, and in the fields of mental retardation and emotional disturbance, medical science has made such headway that we now know a great deal can be done to rehabilitate these individuals and prepare them for a life of happiness and

productivity.

Private foundations and local authorities have all made significant strides. An increasing number of people are being helped and rehabilitated. Particularly is this true in the State of New Jersey, which has long been concerned

with the problem.

But as it becomes increasingly clear that science can help more people, the greater the task becomes. Successful experimentation makes it more and more apparent that much could indeed be accomplished if there were enough teachers, enough therapists, enough facilities and special equipment.

It is obvious that private endowments and local authorities cannot cope with the problem alone. The Federal Government must take over some of the responsibility. Just as, for example, we are already providing fellowships for the training of teachers for mentally retarded children, under Public Law 85–926, we should be taking similar steps in the areas of emotionally disturbed or deaf children. And, just as we help to rehabilitate our veterans, we should also share that responsibility for other elements of our population.

The Federal Government cannot, of course, do everything. But this is a field where a relatively small expenditure can save millions of people from a life of emptiness. If we must speak in monetary terms, let us say that the gain to our economy of these potentially productive individuals surely justifies the expendi-

ture.

I think this committee is doing a great service by investigating the needs in this area. The problems of the physically handicapped, the disturbed, and the retarded are problems of national concern, and I hope that out of these hearings will emerge some workable and forward-looking definition of Federal responsibility and obligation.

STATEMENT BY IRVING W. SHANDLER, DIRECTOR OF PATIENT SERVICES, PENNSYL-VANIA TUBERCULOSIS AND HEALTH SOCIETY

Mr. Chairman, I am highly honored by this opportunity to appear before this

distinguished committee.

Since I am, by profession, a medical social worker and my current position with the Pennsylvania Tuberculosis and Health Society, I would like to focus my remarks on the field of tuberculosis, particularly the rehabilitation aspects of tuberculosis control. And, since my experience has been primarily in the Commonwealth of Pennsylvania, my remarks will be made with reference to that area. However, the problems presented here are essentially the same problems faced by the States of New Jersey, Delaware and Maryland.

Considerable progress has been made in the past decade in sharply reducing the tuberculosis mortality rate. At the same time, the morbidity rate has been

reduced at a somewhat lower rate.

For example, in Pennsylvania, the mortality rate in 1945 was 41.9 per 100,000 population. In 1955, it was 11.1 per 100,000 and in 1958, 9.2 per 100,000. The morbidity rates for the same years are as follows: 1945, 48.8; 1955, 63.4; 1958, 64.1. (It should be noted that beginning in 1953, more effective reporting of cases has increased the number and somewhat affected the trend. However, the basic difference between the mortality decline and morbidity rate is obvious.)

Much of this decline has been due to the discovery and use of chemotherapy and new surgical techniques. Today, many patients who would have been claimed as tuberculosis death statistics are hospitalized, treated, and then returned to the community. Many of this group present a large financial and

social problem.

It is at this stage that the full importance of the bill, H.R. 3465 is recognized. The rate of tuberculosis today is found to be higher among older persons, nonwhites and among men.

New active cases reported per 100,000 population in the Commonwealth of Pennsylvania for 1958 indicated: ²

Total population			
Under 15 years	7.3	Male	42.9
15 to 24	22. 1	Female	15.9
25 to 44	43.5	Uonwhite population	168.1
45 to 64	64.8	Male	215.4
65 and over	75. 5	Female	123.5

Fifty-four percent of the new active cases were of persons 45 years of age and over; 71 percent were white and 29 percent, nonwhite; 69 percent were males and 31 percent, females.

When considered in terms of the Pennsylvania tuberculosis hospital population, it was noted that—

² Source: Commonwealth of Pennsylvania, Department of Health, Division of Statistics and Records.

¹ Source: Commonwealth of Pennsylvania, Department of Health, Division of Statistics and Records.

(a) More than 50 percent of admissions were over age 45.3

(b) An estimated 30 to 35 percent of the patients were identified as alcoholies or problem drinkers.

(c) Just under two of every three patients were social isolates with essentially no family contact (single, divorced, widowed),3

(d) Approximately one out of every three admissions left the hospital against medical advice.3

(e) Based on a recent study conducted by the National Tuberculosis Association, the average reading and comprehension level of the patient population was that of the fourth grade.4

Needless to say, this is a group of patients who are in need of considerable help beyond the medical. Many need retraining for placement, counseling and aid for independent living and the sheltered workshop type of setting that assists in their work evaluation, placement in competitive industry or merely

a place to work.

The intent of H.R. 3465 appears to recognize many of the needs of the tuberculous as well as other disabilities. The bill asserts the true philosophy of rehabilitation in that it goes beyond the "vocational" aspects. Many applicants seeking services who were not accepted for services due to advanced age, degree of disability or poor vocational outlook might now gain the benefits of professional services with the accompanying rewards of the dignity of independent living.

I am certain that the 65 affiliated organizations throughout the Commonwealth and more than 2,000 workers and board members will heartily endorse

this bill.

I would like to specially emphasize two of the points made in section 205(a)

(3) and (4):

3. The recognition of the need for trained personnel to implement the intent of the bill. No act or concept has any real value unless appropriate personnel are available to translate philosophy into action. Serious shortages exist in all of the paramedical professions involved in the rehabilitation of the physically and mentally handicapped individuals. Recognition of these shortages and the continued publicity and financially attractive scholarships and fellowships is one step in assisting recruitment in these fields.

4. The recognition of the need for the dissemination of information gained from various demonstration areas and research projects. No research or demonstration is ever wasted in that much can be learned from the failures as Making such information available to all interested in rewell as successes. habilitation is an obligation of those involved in research and demonstration

activities.

In the letter of invitation from Mr. Elliott, he indicated that the committee would welcome "specific suggestions as to how the Federal Government might aid the States and local committees in attempting a solution to some of these

pressing problems.'

The principal additional need in tuberculosis control in the Commonwealth of Pennsylvania is for financial assistance from the Federal Government for the care and rehabilitation of individuals who have tuberculosis and who are living in a State where they have not established legal residence. Numerically, this group has not been large. However, when they do occur, their care and disposition are usually a problem. The current policy is to treat them at the Commonwealth's expense in one of the Commonwealth's hospitals and then try to arrange for their return to the State of their legal residence through the Department of Public Welfare as soon as they are noninfectious. This often requires a considerable period of time and can present many complications.

Again, may I offer my congratulations for your efforts in the construction of the bill and my appreciation for the opportunity to appear before this group.

culosis Association, New York.

COMMONWEALTH OF PENNSYLVANIA, DEPARTMENT OF PUBLIC WELFARE, Harrisburg, February 24, 1960.

Hon. Carl Elliott.

Chairman, Subcommittee on Special Education, Committee on Education and Labor, House Office Building, Washington, D.C.

Dear Congressman Elliott: The Pennsylvania Department of Public Welfare administers several programs which involve the subjects with which your subcommittee is concerned. Our institutions for the mentally retarded carry on programs of special education and while our office for the blind does not conduct formal education, it is interested in the quality of instruction given blind and visually handicapped children and young people. In respect to rehabilitation, our offices of public assistance and children and youth are involved in the social rehabilitation of families; our mental health institutions collaborate with the bureau of vocational rehabilitation, department of labor and industry, on plans for patients ready for discharge; our office of the blind administers the vocational rehabilitation for blind and visually handicapped persons; our office for the aging is encouraging county homes, nursing homes, and similar facilities which it supervises to establish programs of physical rehabilitation.

It is the experience of this department that there is no one goal and no single method of rehabilitation. Indeed, in outlining to you our interests in this field, I have referred to social, vocational, and physical rehabilitation. ordinated use of a variety of skills is the program emphasis of this department. For example, the rehabilitation of a patient who has been mentally ill involves not merely psyciatric treatment. His return to the community may require preparation of the family by hospital social service, vocational counseling, and placement by the department of labor and industry, referral to a community outpatient clinic for continued treatment. Rehabilitation of the patient is the result of the efforts of people who belong to many professions; it is not the sole province of a single discipline. This is equally true of the "rehabilitation" of a handicapped child, a family long dependent on public assistance, or of an aged person bedfast through lack of incentive and stimulation.

This department believes that grants for projects demonstrating methods of promoting self-help and independent living should be made not just to vocational rehabilitation agencies but to a variety of voluntary and governmental medical, welfare, and rehabilitation services.

We have the following specific suggestions to make respecting vocational

rehabilitation:

In the area of vocational rehabilitation for the blind, it becomes increasingly apparent that Public Law 565 of 1954, and the related regulations, are too restrictive in the provision of post professional placement service. At present, State agencies can provide service after placement for a 30-day period or until a first paycheck is received, whichever is first.

In placing attorneys, social workers, schoolteachers, and others, one of the keys to success is the provision of reader and similar service for a period ranging from 6 months to a year, until the individual is so established that he can assume this burden on this own, either through marriage, or the employment of

usual stenographic assistance.

We suggest that the committee be concerned with the fact that faculty members in schools for the blind need not achieve the same academic status as teachers in similar grades in the public schools. We believe that this is both an injustice to the student and in many instances a serious handicap to good vocational rehabilitation after graduation.

We would suggest that in vocational rehabilitation some additional latitude be given in the diagnosis of applicants. While a degree of latitude exists, if this were spelled out more thoroughly, either in the law or regulations, it would give the State agency opportunity to explore fully the maximum capacity of the individual and would, in effect, serve much of the purpose of the independent living bill.

We further suggest that some provision and consideration be given to reaching the high school student prior to the age of 16 in order to provide counseling, guidance, and other services in cooperation with the school authorities.

We believe that a serious question must be raised regarding the overall benefits derived from the present advanced training of vocational rehabilitation counselors at the university level. It is our experience in Pennsylvania, that the coordinators of these programs who screen candidates for training do not include representatives of the rehabilitation agencies. Moreover, the rehabilitation agencies in Pennsylvania are getting relatively few people from this source of trained personnel, mainly because they come from the field of education, and with a master's degree in counseling, can return to the public schools at better salaries and longer vacations that State agencies can provide.

We suggest that while there is continuing need for research and demonstration projects, there ought to be a more effective clearinghouse for approval of projects

than now exists.

This Department is concerned with special education since it is used in institutions for the mentally retarded. Our experience with institutionalized persons who are mentally handicapped (who may also be physically handicapped) indicates the necessity for teachers and vocational counselors to be part of the institutional team. This means not only that their activities must be psychiatrically supervised but that their professional preparation must be psychiatrically oriented. We believe that Federal mental health grants now available for the training of psychiatrists, psychologists, social workers, and nurses should be extended to the preparation of teachers and vocational counselors who will work in institutions for the mentally retarded and emotionally disturbed.

Before grants for psychiatrically oriented teacher training are established, however, education, psychiatry, and psychology must work out curriculum content and criteria for approved training facilities. This work should be initiated by pilot projects in which selected institutions for the mentally retarded and emotionally disturbed would collaborate with universities having approved special education programs. The results of the pilot projects should then be compiled to form the basis for the development of a nationally accepted program

of special education in a psychiatric setting.

We believe that the greatest potential hazard in this total field is the lack of

coordination among the vast array of agencies working in this field.

While it is true that a great many different and sometimes specialized services are required in each community, we are concerned that the handicapped individual and the family not be lost among them. With the very best of intentions, each of several agencies often become involved in one aspect of a situation with none taking basic responsibility for the ultimate result. We believe that Federal agencies which stimulate, encourage, and support so many local services should be concerned about this matter. They should strive to help us all achieve a maximum of integrated effort in order to make the most efficient and effective use of scarce dollars and hard-to-get personnel.

We are happy to have had this opportunity to express our point of view.

Please call upon us if we can be of further service.

Sincerely yours,

Mrs. Ruth Grigg Horting, Secretary.

MARYLAND STATE DEPARTMENT OF EDUCATION,
STATE OFFICE BUILDING,
Baltimore, February 26, 1960.

Hon. CARL ELLIOTT,

House of Representatives, Washington, D.C.

Dear Congressman Elliott: My appearance before your committee at the hearings in Jersey City on Thursday, February 18, 1960, was canceled because of illness. I regret that I lost the opportunity to testify in behalf of the Maryland State Department of Education. I should therefore like to have this letter inserted in the record of your proceedings, in order that you may have a statement from the department.

As I indicated in my letter of July 30, 1959, educational programs for exceptional children and youth in Maryland, although they have greatly expanded during the past 6 or 7 years, have not been extensive enough to meet the needs. The growth has been steady, however, and it will continue, provided

that Maryland meets her own responsibilities; and

Provided, further, that research concerning the education of exceptional children is encouraged, coordinated, and disseminated, since sound programs should be based on the findings of research;

Provided that a sufficient number of institutions of higher learning offer appropriate sequences in the various categories of exceptionality, in order that teachers may become proficient in their teaching;

Provided that qualified leaders are developed to prepare teachers of exceptional children and youth, and to supervise programs;

Provided that the U.S. Office of Education provides opportunities for State directors of special education and members of their staffs to confer annually on important professional problems;

Provided that the Section on Exceptional Children and Youth of the U.S. Office of Education has the responsibility for the professional aspects of all programs which Congress authorizes with respect to special education: Provided that special education and rehabilitation, each with clearly defined and distinct programs, work out cooperative relationships to foster

the well-being of the handicapped (in our opinion, rehabilitation does not concern the gifted as such.)
The responsibility for developing and carrying out the program of special

education in Maryland rests with the State and local departments of education in Maryland. Nonetheless, the Federal Government can render valuable service by-

Extending the fellowship program of Public Law 85-926 into all categories of exceptionality;

Encouraging, coordinating, and disseminating research in special education, possibly through a research institute;

Providing opportunities for State directors of special education to confer

under the auspices of the U.S. Office of Education;

Increasing the personnel of the Section on Exceptional Children and Youth of the U.S. Office of Education to allow the Section more readily to fulfill its responsibilities in connection with federally authorized programs and to improve the professional guidance given to State departments of education.

The task of providing improved educational programs for exceptional children and youth requires the best efforts of all those engaged in it. We in Maryland, having committed ourselves to a high-quality program, are striving to develop whatever facilities are possible within the public school framework. acknowledge with gratitude the assistance of nonpublic school groups within the State and the support from Federal programs now in existence. We shall welcome additional assistance along the lines indicated in this letter.

We thank you for the opportunity to express our views.

Sincerely yours,

GENEVA ELY FLICKINGER, Supervisor of Special Education.

MARCH 3, 1960.

Congressman Laurence Curtis, House Office Building, Washington, D.C.

Dear Congressman Curtis: Our organization, which represents parents of deaf children, is writing to ask your help in securing the passage of Senate Joint Resolution 127.

This legislation is designed to help alleviate the national shortage of classroom teachers of deaf children, speech pathologists, and audiologists through scholar-

ships and grants to training centers.

As parents of deaf children, we are particularly concerned with the teacher shortage. The Department of Health, Education, and Welfare states that the greatest teacher shortage exists in this area of exceptionality. Approximately 500 additional teachers are needed for next fall and training centers have turned out only 125 this year.

As parents we are vitally concerned that our children not be denied educational opportunity because of the teacher shortage. There are some 30,000 deaf children of school age whose parents are anxiously concerned about the increasingly desperate teacher shortage. With proper education we can expect that our children will grow up to be useful, productive citizens. Over the past 10 years enrollment of deaf children in schools for the deaf has increased about 400 per year. Last year the increase was 900.

Providing trained teachers of the deaf must become a Federal concern because individual States have no training facilities. There are 22 accredited training centers in this country. With additional funds they could provide a substantially greater number of teachers.

Organizations which have united to secure the passage of the proposed legislation are the Alexander Graham Bell Association for the Deaf, the Conference of Executives of American Schools for the Deaf, the Convention of American Instructors of the Deaf, and the Parents Section of the Alexander Graham Bell Association.

We would appreciate your support of this legislation.

Sincerely yours,

SUMNER L. SHIR,

Chairman of the Convention Committee, Massachusetts Parents Association of the Deaf and Hard of Hearing.

Mr. Elliott. Now we bring to a close the day's hearings by thanking the board of freeholders of Hudson County and their supervisor, Mr. Thomas Gangemi, for making this nice hearing room available to us today.

The hearings for tomorrow will be held not in this room, but on the first floor of this building, in the county register record room, which is located, as I understand, on your right as you enter this beautiful

building.

We meet at 9:30 in the morning.

We have another 42 witnesses to hear tomorrow. Thank you.

(Thereupon, at 6:20 p.m., the subcommittee was recessed, to reconvene at 9:30 a.m., Friday, February 19, 1960, in Jersey City, N.J.)

SPECIAL EDUCATION AND REHABILITATION

FRIDAY, FEBRUARY 19, 1960

U.S. House of Representatives. SUBCOMMITTEE ON SPECIAL EDUCATION OF THE COMMITTEE ON EDUCATION AND LABOR, Jersey City, N.J.

The subcommittee met at 9:30 a.m., pursuant to recess, in county register record room, Hudson County Administration Building, Hon.

Carl Elliott (chairman of the subcommittee) presiding.

Present: Representatives Elliott, Daniels, Giaimo, and Quie. Also present: Dr. Harry V. Barnard, clerk of the subcommittee.

Mr. Elliott. The committee will be in order.

Mr. Herbert E. Rickenberg will be our first witness. He is director of the eye and ear infirmary unit, Henry C. Barkhorn Memorial Hearing and Speech Center, Newark, N.J.

We are happy to have you, Mr. Rickenberg. You may proceed for

10 minutes.

STATEMENT OF HERBERT E. RICKENBERG, DIRECTOR, EYE AND EAR INFIRMARY UNIT, HENRY C. BARKHORN MEMORIAL HEAR-ING AND SPEECH CENTER, NEWARK, N.J.

Mr. Rickenberg. Mr. Elliott, gentlemen, I am honored to address the committee this morning in order to discuss hearing and speech

rehabilitation in the State of New Jersey.

First, may I introduce myself. I am consultant audiologist-speech pathologist and supervisor of the hearing and speech program of the division of chronic illness control of the New Jersey State Department of Health.

I am president of the New Jersey Speech and Hearing Association; director of the Henry C. Barkhorn Memorial Hearing and Speech Center of the eye and ear infirmary unit of the United Hospitals of Newark, and director of the Henry B. Orton Memorial Speech Clinic for Laryngectomies of Presbyterian Hospital unit of the United Hospitals of Newark.

The State of New Jersey is made up of 21 counties. At this date six counties have active hearing and speech centers in a hospital setting, a seventh county will have a center initiated in the immediate future. Fourteen counties have no hearing and speech facilities

available to the general public.

There are approximately 5,749,000 people in the State of which

920,567 were registered as of June 1958 in public day schools.

Considering that the incidence of hearing loss in school children is 3 percent then 27,617 are in need of detection for possible medical intervention as a means of alleviating their deafness.

1061

Approximately 1 percent of the school population have permanent nonreversible hearing losses or a population of 9,205 children. This group is in need of a prosthetic device, auditory training, lip reading, and speech correction and conservation.

If we further consider that 5 percent, or, as the case in New Jersey indicates, 46,028 children have speech defects, then the aforementioned figures realize a total population of 55,233 school age children in need

of speech and hearing services.

Since there are approximately 4,828,433 adults in New Jersey and 2.1 percent, or 101,397 may have hearing losses and 3 percent or 144,853 may have speech defects, then the aggregate population of hearing and speech impaired in the State of New Jersey is 301,483 individuals.

Since the possible hearing and speech handicapped population is 300,000 individuals in New Jersey, the division of chronic illness control of the New Jersey State Department of Health in May 1954, activated a joint program with the Newark Eye and Ear Infirmary Hearing and Speech Center. This program is designed through early detection to prevent through medical intervention and rehabilitation debilitating hearing and speech impairments.

Demonstration hearing and speech centers were activated at the Hunterdon Medical Center, in Flemington, N.J.; St. Francis Hospital, in Trenton, N.J.; and Bergen Pines Hospital, in Paramus, N.J.

A fourth center is to be activated this spring at Children's Seashore

House in Atlantic City, N.J.

These centers are initiated as a means of demonstrating to the hospital administration and the community the need of such a program. Application has been made for consideration of a similar project in Warren County.

As of this date there are no facilities in its medical or educational

institution.

An example of patient care for the year 1959 is indicated by the following figures. Five employed professional personnel at St. Francis, Hunterdon, and Newark Eye and Ear Infirmary, had an initial intake of 1,301 new patients for a total of 7,190 patient visits.

The initial intake is of further interest when over 50 percent, or

754 adults, were seen in the 1,301 new patient visits.

Further breakdown indicates 193 preschool children and 354 school-

age children.

The function of each center is not only patient care within the physical facilities of the center; hearing and speech surveys are conducted in the community. Dissemination of information are continual activities of the centers.

Some of the projects include inservice training programs for school administrators, teachers, psychologists, medical social workers, and public health nurses, explaining and demonstrating speech and hearing therapy as a rehabilitative prevention of debilitating handicaps.

Exhibits are presented at county health fairs and State medical

conventions to indicate available facilities.

A recent hospital survey of hearing and speech facilities indicated a few active projects. Most of the programs are centralized in Essex County.

Here in Hudson County there is no public project. There are an estimated 2,500 aphasics in the State of New Jersey, yet there is only

one intensive rehabilitative care program in the State.

What professional personnel do we have in the State? The American Speech and Hearing Association lists approximately 100 individuals residing in the State of New Jersey; 5 are not employed in the State; 7 employed in the State hold advanced certification in speech; 26 have basic certification in speech; and 1 has basic certification in hearing.

There are approximately 167 therapists with no clinical certification that are registered with the New Jersey Speech & Hearing Association that are employed in positions where they are supervised by

certified personnel.

But if we consider that there are approximately 55,000 schoolchildren with speech and hearing impairments, this leaves a caseload of 276 individuals per therapist. This does not consider the 246,000 adults.

This problem can be amplified to a greater extent. But let us

consider the college programs in the State.

There are 23 universities, liberal art colleges, and professional and technical colleges in the State. Approximately six of the colleges have a program in speech and hearing of some sort, yet there is no doctorate program available in speech and/or hearing in the State.

One of the problems faced is a matter of economics.

The colleges must have a certain number of registrants per course,

or the class is canceled.

Since there is no doctorate program there is little recruitment of graduate candidates. Personnel to be obtained through graduate programs then must be increased. Since the colleges work on the basis of registrants for a course, the need for House Joint Resolution 494 is critical if we are to service the hearing and speech impaired in the State of New Jersey.

The division of chronic illness control is interested in providing services for the possible 301,483 hearing and speech impaired. There are 14 counties in the State that have no facilities. Moneys are needed to develop these facilities and personnel are needed to man them.

What of the established facilities?

The Henry C. Barkhorn Memorial Hearing and Speech Center of the Eye and Ear Infirmary United of the United Hospitals of Newark now services a medical staff of approximately 400 men. ception it served the medical staff of a specialty hospital. Today it serves the staff of the largest hospital in the State of New Jersey.

The United Hospitals of Newark is composed of Presbyterian Hos-

pital, a general hospital;

Babies' Hospital, a pediatric hospital;

Crippled Children's Hospital, an orthopedic hospital; and

The Eye and Ear Infirmary.

Affiliated with the United Hospitals of Newark is the Kessler Insti-

tute of Rehabilitation.

Within a year a new structure will be erected for the four hospitals. Plans call for a division of rehabilitation for acute care, and the Kessler Institute in West Orange for intensive care.

The hearing and speech center as contemplated will cost approximately \$150 million. Professional personnel in hearing and speech requires three clinical audiologists, two audiometrists, two speech pathologists, and four speech and hearing therapists.

Where will we obtain personnel? There is no program in the State

for the training of audiologists.

The needs provided in House Joint Resolution 494 is critically illustrated in the State of New Jersey. We have an immediate need for five audiologists and speech pathologists.

In 3 years we will need 25 more, and this does not consider the needs

in the educational systems.

When you consider that the number 30 is small compared with the 400 graduates per year, but multiply the 30 by 50, and you find the figure is not small.

What about the homebound who can benefit from therapy and

become productive, contributory members of society?

Facilities must be developed and expanded. This can only become

a reality by the activation of H.R. 3465.

It is true that we need the facility, we need personnel, but we also need some means of obtaining economic returns for services rendered.

In New Jersey private agencies and the State department of health have taken measures to fill a need, but further expansion and development is required.

Thank you.

Mr. Elliott. Thank you, Mr. Rickenberger.

Mr. Theodore Cohn, president, Occupational Center of Essex County, West Orange, N.J., is our next witness.

You may proceed, Mr. Cohn.

STATEMENT OF THEODORE COHN, PRESIDENT, OCCUPATIONAL CENTER OF ESSEX COUNTY, WEST ORANGE, N.J.

Mr. Cohn. The few remarks I am going to make are also to be considered having been given by the Occupational Center of Hudson County, which is a comparable type of sheltered workshop.

First, we would like to indicate our support for the House bill 3465,

the independent living bill, of which we are very much in favor.

I would like to add one point as to where we feel we would get a

great deal of help or additional subsidization.

The sheltered workshop I represent deals primarily in the training and rehabilitation of cerebral palsy and mentally retarded adults. We are sponsored by several organizations and receive the bulk of our funds from the New Jersey Rehabilitation.

In addition to these two handicaps we also give help to epileptic people and we have had other handicapped, who our professional staff

feels might benefit, come into the shop.

Now, the services of the rehabilitation, as far as support for our shop goes, continue for 40-odd weeks, during which time an extensive evaluation, guidance, and training program is given to the trainees.

At the end of this time it is often very difficult to determine whether or no a trainee is subject to vocational employment. In spite of the evaluation of both the rehabilitation, the sponsoring agencies, and our own staff give to such trainees, after the conclusion of this 40-odd weeks of training, it is not always possible to place these people into

employment.

I will say that the last week, as an example, we placed five people. Some of them had been in sheltered employment for as long as 5 months; some of them longer than that—as long as 2 years.

During this period, from the time they are training on the rehabilitation commission support has gone on. From that point on until they get employment, they are not sponsored by any State or

Federal agency.

Because it is so difficult today to evaluate the period during which it is necessary to continue a person in sheltered employment before he can get private placement, we would like consideration to be given to subsidy for these people during the time that they are in what we call sheltered employment.

Now, the reason this is required is that the evaluative techniques which determine whether or not a cerebral handicapped person is capable of employment, have not yet been so refined that you can say a year before that person has finished his training he will be per-

manently employed in a private industry.

We cannot say that yet. Therefore, we have continued to take these people in our sheltered workshops even though at the end of this training period they have not gotten jobs, and have found, as our experience last week is an indication, that we can get them employment and take them off any other type of private or public support.

The amounts of money involved here are not very significant in relation to the types of training, but because the evaluation and the training period is so flexible, because the types of handicaps that the sheltered workshops deal with are so many, it is very difficult to cut that training period off at one point and then say at this point "No more" when we know from our own experience we have placed 20 or 30 or more people in private industry after their training period has been concluded because we have kept them in sheltered employment.

We would like, therefore, consideration for subsidization of this

type of training in the sheltered workshops.

A second area we would like to have consideration for is the fact that sheltered workshops should be included in the group of organizations who have access to government surplus property by gift or by special purchase. Sheltered workshops are nonprofit organizations. They are usually locally sponsored. They do receive some funds from State rehabilitation commissions for their training.

But in their setting-up period, particularly where they have a large number of trainees before they have gotten a fair amount of public support in their community, they are usually in desperate need for basic facilities—desks, tools, equipment, supplies, and even buildings.

If sheltered workshops could be included in that group of organizations which has access to Government surplus property, it would be

a great help.

Another point we would like to mention is the coordination on a national level of the type of work that sheltered workshop employees

can do. What I mean by that is this:

Though there are professional organizations, they have not, to my knowledge, and the knowledge of our staff, developed this type of information. I will give you an example:

Our own workshop, dealing primarily in retarded and palsied people, does a great deal of contract work in the Essex County area with manufacturers and other types of business people. We know now from our own experience the type of work that our handicapped people can do. We have standards. We know how many items

they can make, assemble, nail, and test.

If there were a national place to which all of this type of information could flow professionally, it would be a great help. It would mean that if we knew that a Kansas City sheltered workshop dealing in the retarded, for example, or in the epileptic, or in brain damage people, was capable of doing a specific job and had done so successfully and had developed standards for the type of work that its handicapped people could do, it would give us a confidence with information to go to a comparable manufacturer in Essex County and say we know that they can do this because a comparable workshop in Kansas City has done it and our people are the same level of handicap.

We feel this could be done on a national level because there are sheltered workshops all over the country and their experiencs are

not that diverse.

Most of them have fairly narrow areas of work and getting this in-

formation in one channel would be a great help.

Mr. Elliott. Mr. Cohn, you have 1 minute now in which to finish. Believe me, it is hard to stop somebody who is talking about something as interesting as I consider your testimony to be, but that is the way it has to be.

Mr. Cohn. One last statement, then.

We would like to have the Congress consider all handicapped, cerebral-palsy-handicapped people, in one category. Instead of putting the blind and the epileptic and palsied and retarded and narrowing them down, we have found as a multihandicapped shop that cerebral-handicapped people basically can be handled.

It is not crucial unless there are severe medical reasons or psychological reasons why all people cannot be put together if they are

severely handicapped.

We feel that all cerebral-handicapped people should be considered in one category and that legislation should be determined for them.

Thank you.

Mr. Elliott. Thank you very much.

Mr. Giaimo has a question.

Mr. Giamo. About putting the handicapped together, is that the consensus of thinking as far as the blind or some of these other handi-

capped?

Mr. Cohn. I doubt very much, if I were representing the blind, whether I would want to have the interest of the blind diluted in effect by having them included. But we represent five or six different handicaps, some of whom are not organized to the same degree that the blind are.

From a human viewpoint, a cerebal-palsied person is just as dis-

abled as the blind.

Mr. Daniels. Your workshops have the necessary techniques and

experts to take care of all of these handicapped?

Mr. Cohn. The handicaps we have been able to accept in our particular workshop have been accepted only when the rehabilitation

commission and our professional staff feel we can take them. This group so far in our 5 or 6 years has included the retarded, palsied, brain damage, epileptic—we are not considering multiple sclerotic people.

Mr. Elliott. Dr. Michael Marge, key coordinator, New Jersey Liaison Committee on American Speech and Hearing Association,

Montclair, N.J.

Dr. Marge, you maye proceed for 10 minutes.

STATEMENT OF DR. MICHAEL MARGE, KEY COORDINATOR, NEW JERSEY LIAISON COMMITTEE ON AMERICAN SPEECH AND HEAR-ING ASSOCIATION, MONTCLAIR, N.J.

Dr. Marge. Mr. Elliott and members of the committee, what I have to say today is being said on behalf of three facets of our population.

First, I speak for the key personnel in the area of speech and hearing pathology and of the education of the deaf who attended the New Jersey workshop on Federal legislation, which was recently held at Montclair State College.

Second, I represent that segment of the college and university teaching profession interested in the training of qualified professionals in

the field of speech and hearing.

I am a college professor.

And, third, as a speech pathologist and member of the American Speech and Hearing Association, I wish to assume the privilege of representing the millions of individuals suffering from communicative disorders, such as the deaf, the aphasic, the cleft palate, the cerebral palsied, the stutterer, and the laryngectomized.

Those whom I represent strongly support the bill you have introduced, Mr. Elliott, House Joint Resolution 494, since it provides grants-in-aid to training institutions for the education and training of professional workers for the seriously understaffed area of special

education, the speech handicapped and hearing impaired.

Seriousness of the communicative disorder: Undoubtedly, in past hearings, you have heard much testimony describing the incidence of speech and hearing handicaps in our population. But has the serious nature of the handicap been effectively communicated to you?

Without becoming maudlin, please let me describe three reasons why the communicative disorder presents one of the most disabling

problems faced by the handicapped individual.

First, since speech and personality are so intricately related, many of our patients present concomitant problems of emotional illness.

Second, from your own experiences in the process of interacting with your associates and colleagues in Congress through the seemingly magical powers of oral communication, you must realize the tremendous need each human has for oral expression.

This avenue of communication is closed to the handicapped in-

dividuals with whom I work. The result is heartrending.

And, third, as one of the most serious of handicaps, communicative disorders also represent the largest number among those in need of special education.

Incidence in New Jersey: May we briefly turn now to a consideration of incidence. I must admit that I can best speak about the scene in New Jersey.

Using the New Jersey Department of Conservation and Economic Development, estimates of total population in the State, at present

we find a population of about 5,900,000.

The American Speech and Hearing Association estimates that for the general population we will find 5 percent with speech handicaps, and 3 percent with hearing impairments severe enough to require the services of a speech pathologist and audiologist.

Therefore, in New Jersey we can expect to find 295,000 individuals with speech disorders, and 177,000 individuals with hearing disorders, giving us a total of 472,000 communicatively handicapped

persons.

If we use the conservative prediction of the 1950 White House Conference that 5 percent of the school population can be expected to have speech and/or hearing handicaps, we find in New Jersey, 88,500 children between the ages of 5 and 19 with communicative disorders

in need of special attention.

Incidence in the city of Bloomfield, N.J.: Let us consider for a moment what this means to a small community such as Bloomfield, the town in which I reside. Bloomfield has an estimated population of about 55,000; therefore, we can expect to find 2,750 speech handicapped and 1,650 hearing handicapped children and adults, giving us a total of 4,400.

The only trained personnel working in the city of Bloomfield are two speech therapists who have been hired by the board of education. If they were responsible for the total population of speech and hearing handicapped children alone, they would have to serve some 825

cases.

But what about the remaining 3,575 handicapped persons outside the age range of 5 to 19? They are left to shift for themselves—to

search for help in areas far from home and at great expense.

In the area of education of the deaf, the need for trained personnel is equally as great. Recently, I received a communication from Miss Gladys Fish of the Bruce Street School for the Deaf in Newark. She indicated that 25 deaf children over the age of four had to be turned away this year because of a shortage of qualified personnel and lack of facilities at her school.

The estimates I have presented represent the population now, but we well know that our population is ever increasing and with this in-

crease, the problem becomes more acute.

The need for personnel and training facilities: Using the estimate of the Office of Vocational Rehabilitation that there is the need for 1 speech pathologist and 1 audiologist per 50,000 population, providing a strong speech and hearing program is operating in the schools, in New Jersey we presently need 118 speech pathologists, giving us a total of 236 qualified professional workers.

We have—and I repeat—we have only eight individuals who may work independently at the level of advanced certification by ASHA

with at least a Master of Arts degree.

Presently, there are no programs in the State for the training of speech pathologists and audiologists. However, there are at least four institutions of higher education prepared to inaugurate a training program on the graduate level for speech and hearing pathologists.

But money is sorely lacking.

Based on OVR experience of the past 2 years, \$11,000 per school per year would be needed to provide each of these training centers with additional staff and equipment to upgrade and expand training facilities. If this support were to be extended to provide training fellowships at the current average of OVR—which is \$2,500 per fellowship—and if Government support were to be provided for one-third of the needed 236 qualified personnel we must train each year, at least 195,000—78 persons at \$2,500—would be needed annually for traineeships.

The combined annual cost of the teaching grants to the 4 schools and training grants to trainees, would come to a total of \$239,000 per year for 10 years. Such grants would give us the necessary impetus to organize these programs as soon as possible and to train as

well as possible the needed personal.

The need for House Joint Resolution 494, at the Frampton committee workshop in Philadelphia last Tuesday, a representative of the Pennsylvania State Bureau of Vocational Rehabilitation cited the fact:

That for every dollar the Office of Vocational Rehabilitation spends for the habilitation of the handicapped, seven is returned to the Federal Government.

In view of this, passage by Congress of House Joint Resolution

494 makes good money sense.

But we should not overlook the tremendous humanitarian values implicit in aiding the individual with communicative disorders. Let me illustrate:

Twenty seconds recording—speech of a young adult stutterer. I shall never forget this case of a stuttering boy of 19 who was refused admission into college because of his stuttering despite his high level of intelligence and his qualifications for success in every other respect.

In my experience as a speech pathologist, this situation has been repeated time and time again. In an age when we, as a Nation, are desperately trying to eliminate waste in manpower, to improve human communication in a growing democracy and in a dwindling world where speech becomes the core of human interaction and cooperation, and to ameliorate the lot of the handicapped child and adult, we must not overlook the question of providing qualified professional personnel to meet the needs of this grave situation.

I beg you to consider these matters and to call for an early hearing

and passage of Mr. Elliott's legislation.

Let me thank you for this opportunity to express my views and the views of my colleagues in New Jersey about the importance of speedy consideration of House Joint Resolution 494.

We fully appreciate your kind interest in our behalf and sincerely

hope that our efforts will not have been in vain.

(List of workshop and participants in New Jersey Workshop on Speech Pathology, Audiology, and Education of the Deaf, follows:)

PARTICIPANTS IN NEW JERSEY WORKSHOP ON SPEECH PATHOLOGY, AUDIOLOGY AND EDUCATION OF THE DEAF

Dr. Michael Marge, Chairman of Workshop, Assistant Professor of Speech, Montclair State College, Upper Montclair, N.J. Dr. George W. Gens, Director, Special Education, Newark State College, Union, The Reverend John P. Hourihan, 47 Central Avenue, Newark, N.J.

Miss Betty Horwitz, Speech Pathologist, Kessler Institute, West Orange, N.J. Mrs. Ere Hubschman, Assistant Professor of Speech, Montclair State College, Upper Montclair, N.J.

Miss Ellen Kaufmann, Associate Professor of Speech, Montclair State College,

Upper Montclair, N.J.

Mr. Donald Markle, Audiologist, 2345 Linwood Avenue, Coytesville, N.J.

Mr. Herbert Rickenberg, Director, Speech and Hearing Services, Newark Eye and Ear Clinic, Newark, N.J.

Dr. Jay Sanders, Speech and Hearing Center, Trenton State College, Trenton,

Dr. Harold Scholl, Professor of Speech, Montclair State College, Montclair, N.J. Mr. Louis Stoia, Director, Speech and Hearing Services, Montclair Public Schools, Montclair, N.J.

Mr. Anthony Suraci, Seton Hall University, Newark, N.J.

Miss Jane E. Swartz, Speech Correctionist, Bloomfield Public Schools, Bloomfield, N.J.
Miss Elizabeth F. Titsworth, New Jersey School for the Deaf, West Trenton, N.J.

Miss Elizabeth F. Titsworth, New Jersey School for the Deaf, West Trenton, N.J. Mr. Phil Wakstein, Speech Pathologist, Hospital Center at Orange, Orange, N.J. Albert L. Venutolo, 194 Sip Avenue, Jersey City, N.J.

Mr. Elliott. Thank you very much, Dr. Marge.

Now, I recognize the gentleman from Connecticut, Mr. Giaimo, for

a question.

Mr. Giamo. Dr. Marge, these figures you gave me about the 5 percent incidence in New Jersey and the lack, the almost total lack of numbers of trained personnel, is very similar to the situation in Connecticut and some of the other States.

But is there any indication that there are people who want to take

this type of training?

Dr. Marge. Yes, there is. We are training undergraduates presently. Most of them are having difficulty in seeking financial support on the graduate level within this area.

They will have to go to Midwest or California.

Mr. Giaimo. I have heard this testimony before and I am very much interested in it. Yet, I wonder if the reason that many of the schools do not have this type of training is because there might not be a demand for it, rather than funds for it.

Dr. Marge. There certainly is demand.

Mr. Glaimo. Demand in the sense that there are students who want to study it?

Dr. MARGE. Yes, there is demand.

Mr. Glaimo. There definitely are students who would like to take up this type of study?

Dr. Marge. We can provide statistics if you wish.

Mr. Giaimo. I wish you would.

Dr. Marge. We will present the information to the committee.

Mr. Quie. Have you appeared before your State legislature advocating that some program be started for the training of speech and

hearing pathologists?

Dr. Marge. I will say in deference to the State Department, we have tried for a number of years. There are a number of professionals in the eight—there are about eight of us who have tried and we have not been too successful at the present time because of the lack of funds.

We have a peculiar situation in New Jersey. It is unfortunate.

Mr. Elliott. Thank you very much, Dr. Marge.

Dr. Marge. Thank you, Mr. Chairman.

Mr. Elliott. Now, I am going to turn the gavel over to my friend and coworker, Mr. Daniels, a member of this subcommittee. Mr. Daniels will preside over the hearings for the next hour. He will call the witnesses.

Mr. Daniels (presiding). Mr. Chairman, I would like to present the next witness, a young man I have known personally for many years, and who has been very active in our civic and social societies in

our State.

This young man is the director of the Jersey City Housing Authority and also a member of the board of governors of the New Jersey

Citizens Council on Λ ging.

In connection with his association with both these organizations and civic and welfare societies in the city, he is very much interested in the problems of the aged and also the handicapped.

So it is my pleasure to present Mr. Conrad Vuocolo.

STATEMENT OF CONRAD VUOCOLO, DIRECTOR, JERSEY CITY HOUSING AUTHORITY, NEW JERSEY

Mr. Vuocolo. Thank you.

Mr. Daniels. Do you have a prepared statement?

Your prepared statement appears rather voluminous. I would suggest to you that you summarize it and I shall direct the reporter to file your prepared statement immediately following your oral testimony.

Mr. Vuocolo. Thank you, sir.

I would not attempt to read the statement because of the time limitations, but I have a synopsis here which I will take about 4 or 5 minutes.

At the outset I would like to express appreciation to the Honorable Carl Elliott and to you, Congressman Daniels and other members

of your group, for the opportunity to testify.

Many here in Hudson County are pleased that these hearings are being held. From my understanding it is the first time in the history of our county that hearings of this type are being held in this locale.

No doubt it is a tribute to our hard working Congressman, Con-

gressman Daniels.

I like the provisions of your proposed bill and feel sure it will provide a renaissance of ideas and assistance to those we are discussing today.

For studying such problems and aiding these groups you are to be complimented for your strife to help those who so badly want to

help themselves.

When the invitation to appear before your committee was received, we conducted a survey among our 3,500 families comprising about 16,000 persons.

This is our low income housing program of nine developments.

Much to our surprise more than 25 percent of those living in our units have persons in their family who are in the age category or afflicted with dystrophy, tuberculosis, chronic heart condition, deaf, blind, mentally retarded, the palsied.

While we were surprised at the high number, it justified the close relationships we have enjoyed with the city, county, and State agencies.

We work together here in Hudson County with these agencies in order to assure every possible assistance to be granted not only to those with low income families, but those who have special problems.

We present this in order that your group, or future working groups, with the same problem, may carefully consider the service that public housing in general can provide for those you are studying; namely, the privilege of homes at home, removing the necessity of institutionalization and furthering the independent living provisions of your bill.

Happily we can report that the housing authority just 10 days ago housed the first woman in the State and possibly in the Nation, who is a totally disabled person and under the recent change in the Federal

Housing Act we were privileged to house her.

She was ready to go to an institution at the county level.

In the prepared report we indicated the story of the quadriplegic that we moved into our newest elevator apartment which permits him now to leave his former four-story walkup where he was virtually a prisoner for 8 years since the time he had his spine crushed.

Housing authority personnel in our desire to be of assistance have specially constructed movable ramps to assist the young man in ques-

tion when he desires to leave the apartment.

To complete a picture of possible vocational rehabilitation in this case the New Jersey Commission on Rehabilitation has requested that we consider the man being able to obtain a degree of self-sufficiency by permitting him to have a newsstand or candy stand at the sight level.

Some of our developments are in areas where he could be providing

the service and also providing his own keep.

In addition to some of these positive actions and there are more noted in the report, we offer several suggestions concerning medical care on sight for the aged and the possibility of removing the necessity of maintaining some of the senile patients in our county homes in mental hospitals to public housing units where they may have the dignity of their own home and at the same time reduce costs for expensive hospitalization.

This sounds very vague, but the housing authority with the cooperation of all the social and welfare agencies that would be necessary would be willing to try an experiment of taking two of the aged in the geriatric hospital, put them in the public housing, have your public nurses visit them on occasion, have the county welfare board provide assistance, we provide the housing. I think that program may not be novel, but we would like very much to try the experiment

at our level.

Due to the large number of these cases we have within our units and no doubt other communities of our size have a like or larger number, we would like to present the possibility of a study to determine the feasibility of having one such housing development of special construction which would contain in specific amounts facilities for the blind, deaf, crippled, the aged, et cetera.

We could envisage such a unit that would be well termed a rehabilitation village which would necessarily, of course, have to be staffed with the medical, social, educational personnel and facilities who would provide the services on the site, itself.

At present a great amount of time and money is being expended to transport these people to schools, hospitals, and also treatment centers,

sheltered workshops et cetera.

I am sure with the proper study a sheltered workshop could be put possibly on the site of the huge development and it would provide some income and assure the independent living aspects of your bill.

The combined function with special ramps, room layouts and other

facilities are envisaged for those in need.

We can see where training or rehabilitation would be permitted on

a 12-month basis.

Let me tell you, gentlemen, in closing, we work with families very closely. I have seen the effect of the implosion of a family that has all of a sudden gotten a problem where the child is determined to have cerebral palsy or a child is suddenly discovered to be deaf or you have the situation of an aged parent.

The effects are tremendous. That is why you really should be congratulated. I hope the provisions of the bill will be enacted because they are very, very necessary from our level and we only talk from

one segment of a rehabilitation team, just the housing level.

But public housing in general, I think, are willing to try experiments to reduce the cost of institutionalization, to make homes for people where they belong at home.

Thank vou.

Mr. Daniels. Thank you, Mr. Vuocolo.

Are there any questions?

(The formal statement of Mr. Vuocolo follows:)

STATEMENT BY CONRAD J. VUOCOLO, DIRECTOR OF TENANT RELATIONS OF THE HOUSING AUTHORITY OF THE CITY OF JERSEY CITY, PAST PRESIDENT OF THE HUDSON COUNTY SOCIAL WORKERS' CLUB, AND MEMBER OF BOARD OF GOVERNORS OF THE NEW JERSEY CITIZENS' COUNCIL ON AGING

At the outset I would like to express appreciation to the Honorable Carl Elliott, chairman of this committee, and Congressman Dominick V. Daniels for the opportunity to testify regarding these hearings on needs for rehabilitation and special education.

No doubt this committee heard yesterday of the many negative situations

regarding needs in the fields under study at these hearings.

While I will present some problems that may be able to be corrected, I would like to have the initial part of my statement reflect some of the positive actions

taken at our community level regarding some of these problems.

1. It has been the policy of the housing authority of the city of Jersey City to work in very close contact with social and welfare agencies throughout the county to assure every possible assistance be granted not only to those low income families as such but those who have special problems regarding the aged, physically handicapped and others who are in need of rehabilitation. With this in mind I think I would be remiss if I did not have inserted into this official record due and adequate credit to the commissioners of the housing authority of the city of Jersey City, our governing body: Board Chairman Samuel C. Di Feo, Vice Chairman John J. Barry, and Commissioner Peter J. Murphy, Commissioner Maurice B. McLaughlin, Commissioner John C. O'Neil, and Commissioner John Ross, who have provided excellent decisions regarding our desire to house those in the greatest need for improved housing conditions.

As reported in the Jersey Journal of August 29, 1955, the housing authority in conjunction with the Jersey City Medical Center instituted a program of tak-

ing long-term ambulatory patients out of the hospital and placing them into public housing with the cooperation of the medical center officials, welfare and public health officials. We housed Mrs. Kay S. and her sister Mary, who are both muscular dystrophy victims. Mrs. S. was in the hospital for more than a year and required long and costly treatment which had to be provided by the community on an indigency basis. With all teams cooperating in this Operation Rehabilitation this family was housed and while one member of the family lost the fight to the disease, the other still remains in the dignity of her own home.

Many other cases of this type have been worked out reducing the long-term institutional care. As a matter of fact we are preparing to house a long-term tuberculosis patient at the request of the rehabilitation counselor of the B. S. Pollak Hospital for Chest Diseases, in a unit immediately adjacent to the hospital which will still permit necessary home or outpatient treatment.

2. In addition to working with our medical facilities on cases of this type, the Jersey City Housing Authority led the fight to remove the necessity of a family composition to be of two or more persons, allowing single elderly folks to be

housed in low income housing units across the country at age 65.

This made unnecessary the admittance of many of these persons to institutions or homes provided for the aged. In September of last year President Eisenhower signed into law a reduction in the age, which now permits the housing of females at age 62 as a result of a bill which was sponsored by Congressman Cornelius E. Gallagher of Bayonne, N.J., at the specific request of the commissioners of the Jersey City Housing Authority.

We were very happy to house Mr. Mary Ford as the first woman in the Nation to be admitted under the new law. This action was reported in the December 1959 edition of Aging, the official publication of the U.S. Department of Health, Education, and Welfare, page 2, a copy of which is attached hereto and marked

We were very happy to house Mrs. Mary Ford as the first woman in the Nation

A second feature of the September 1959 changes to the housing law allowing

the housing of persons totally and permanently disabled to be housed at age 50. On February 4, 1960, we housed Mrs. Louis Lyles, a disabled widow, recipient of benefits for total disability from the Hudson County Welfare Board, into a unit of her own. This move was marked as the first in the State of New Jersey, and possibly the Nation, to be allowed.

For your information we are submitting herewith copies of articles appearing on this subject in the Newark News of Friday February 5, 1960, and also the

Jersey Journal and Hudson Dispatch. (See exhibit B.)

In addition, the New York Journal American reported the admittance of this disabled widow which was hailed by Commissioner John W. Tramburg, director of the State of New Jersey Welfare Commission as of great social significance. This case illustrates where public housing was in a position to serve both the tenant and the community as the welfare board paid \$53 per month for this person who is now in one of our one-bedroom units at a \$28 welfare charge which includes heat, gas, and electricity, and refrigeration.

3. In addition, last August 27, 1959, in order to point up the cooperation necessary in order to completely rehabilitate whenever possible, housing accommodations were provided in an elevator apartment at the request of the New Jersey Rehabilitation Commission for Neil G., age 23, who had been bedridden since his spine was crushed 8 years ago in an automobile accident. Attached herewith are articles appearing in the August 27 edition of the Newark News and the Jersey Journal reporting the housing of this paraplegic. (See exhibit C.)

The part that public housing did play and could play in cases similar to this has had significance in view of the fact that the rehabilitation commission reported to us that the man was virtually a prisoner in his four-story walkup apartment which just about nullified the work provided by the New Jersey Rehabilitation Commission and the Kessler Institute at a cost of over \$30,000.

Miss Carmel Cucinotto whom we have worked with regarding this case certainly deserves our compliments in the excellent presentation and dignified persistence she pursued prior to the housing of Neil G. Please note in the articles attached hereto that the housing authority through its cooperative maintenance men set up special steel ramps permitting the tenant to enjoy outside freedom and use of recreational facilities at the Currie's Woods development where he resides.

In addition to working with the New Jersey Rehabilitation Commission we enjoy a close relationship with the New Jersey Commission for the Blind, and

the Veterans' Administration, and Social Security Administration, and the housing of many cases referred to us involve persons who are troubled.

4. Housing of the aged. The Jersey City Housing Authority and no doubt other housing authorities in urban areas such as those in Hudson County were faced with the problem of a steady disturbing shift in population.

This shift in population is resulting in an exodus to the suburbs of the youth-

ful, economically safe, and healthier segment of our population.

In the 1950 census, Jersey City had over 30,000 of its citizens or over 11 percent in the age 60 or over category. It is anticipated that the 1960 census, soon underway, will result in a jump to 15 percent or 17 percent in this area.

The housing of this group provides many problems, especially in view of the fact that the Jersey City Housing Authority has no specific housing for the elderly. In order to provide therefor, the Commissioners of the Housing Authority of the city of Jersey City immediately eurmarked 860 of their 3,518 apartments for use by the elderly, and ordered preference for admittance whenever possible.

We have a population of about 2,000 of these so-called senior citizens who would possibly be forced into some medical or old-age institution had not these units become available wherein rents are charged commensurably to their

incomes.

We do, however, have over 1,000 applicants on file and are requesting ap-

proximately 300 units to be specifically designed for the aged.

In addition to the above, we are most happy to report that several months ago we were able to house several of the residents of Sienna Hall, a resident home for the aged who were forced to move when the residence had to close due to economic reasons. (See report of March 17, 1959, attached and marked "Exhibit D".)

It is with this picture in mind that Mr. Jim Bishop, the nationally syndicated columnist of the Journal American, reported in his column of July 16, 1959, that an aged couple whom he has befriended indicated that the public housing unit they resided in could be termed "* * * home for the ruptured

and crippled * * * "

In view of the following we have often heard that our public housing units could reflect part of the famous quotation "* * * give me your tired, your poor, your huddled masses yearning to breathe free, the wretched refuse of your teeming shore, send these, the homeless, tempest tossed, to me, I lift my lamp beside the golden door," which is on the base of the statue of our fair lady standing on Liberty Island in New York Harbor for the last 75 years.

Some of the other features we have put into effect regarding service to those

involved are the following:

(1) Senior Citizens Employment Service, wherein local employers have cooperated and provided part-time "special situation" employment to our senior citizens and helped project the desire for independent living. Kindly see the attached account from the March 1, 1959, edition of the Newark News reporting the housing of Mrs. Pauline Stager, age 94, who requested a specific location because she wanted to be near her work, and from the Jersey Journal of September 29, 1959. (Exhibit E.)

(2) A public information center. We have created for each one of our nine developments public information centers which we stock with many fine booklets provided by the U.S. Government Printing Office on subjects regarding nutrition, health, medical care, etc. Congressman Dominick V. Daniels has

been of assistance in obtaining these booklets for distribution.

(3) Senior Citizens Information Center. Staffed by personnel of our agency. In addition to their other duties, provides information regarding health, educational, and other community agencies who handle the problems of the elderly.

While the above illustrates some of the positive results that adequate or public housing can play in the problems of the handicapped, we would like to respectfully recommend the following action be considered regarding the aged and infirm and possibly some of the other areas under consideration by this honorable committee.

(1) As we have a high concentration of the elderly folks in our developments, the housing authority has been attempting for the past year to have the community, possibly with the assistance of the Seton Hall Medical College, located here in Jersey City, provide traveling geriatrics clinics. This type of service we feel can be easily furnished by utilization of facilities existing in each of our units known as baby "Keep Well" stations. With this view in mind discussions

were had last week with the staff at the college regarding this possibility. Your committee may be of service in possibly arranging that Federal, State, or private agency provide grants and aid for health service or funds to permit medical schools and universities to develop programs for the teaching of basic concepts to the care of the aged.

No doubt the low-income families who are now denied medical care or service would provide excellent training programs for those pursuing courses of study

in medicine or rehabilitation.

Fuller utilization possibly of facilities of the Public Health Service may result in the increased care on a preventative basis which would nullify or reduce the terrific burden communities have in providing hospital or institutional care for the aged.

(2) Income maintenance is of the utmost importance as we have witnessed countless members of tenants or applicants for our units in severe emotional states "driven out of their minds because they cannot carry on with the meager

income provided by welfare or social security benefits."

Realistic public assistance payments, we believe would give many of these persons the strength to carry on and remove the necessity for many of them

turning into homes for the aged resulting in high institutional costs.

With this in mind we recommended last July 1959 to Congressman Dominick V. Daniels and Congressman Cornelius E. Gallagher that they urge the Government to study the possibility of obtaining surplus foods from agencies such as the Department of Agriculture for distribution to the elderly low-income persons needing the same. We have requested that the food be distributed in such a manner that would uphold the dignity of the individual involved, perhaps through a stamp plan.

Many are puzzled when we read of the millions of dollars in food and aid being sent to foreign lands when some of our own citizens are being forced to

try to suffice on \$40 or \$50 per month.

Perhaps your committee would like to pursue this possibility as to see whether

such a food plan is feasible.

It has been noted in the report on Conference on Economic Progress, December 1959, on the Federal budget and general welfare that the income position for the senior citizen is dismal. They report that, "It follows that most of these old people do not have the means to maintain even a minimum standard of health and decency."

We note this daily in our developments and it appears that some of our aged tenants seem to be wasting away from malnutrition. In our opinion there is nothing like adequate food to eliminate cases of mental or physical breakdown among our elders, making necessary institutional or hospital care cost tre-

mendously.

We also would like to recommend that a study be made of the possibility of extending the purpose of the school lunch program to provide for the feeding of these elderly low income folks in existing school facilities at nominal cost to them. As the facilities would be in use for most of the year for the school-children who are fed with some of the surplus foods provided, we feel that the extension of the service to include the elderly would cause slight inconvenience.

(4) Recreational and social needs. Recreation is an important facet of serving this group of citizens who certainly deserve consideration for the great contributions they have made to our country financially and in time of war.

It is very difficult to provide recreation facilities in communities such as ours without adding overburdening costs to the local government.

Perhaps grants can be made to recreational or educational departments of communities to train or provide service or community recreational centers for

use by the senior citizens.

Last weekend we had a most unfortunate incident concerning one of our So-year-old tenants who fell in her bathtub on Friday evening and was not discovered until the following Tuesday. Situations like these point up the need for a coordination of all services recommended if we are to avoid undue hardship as illustrated for our aged and/or chronically ill. The assistance required to provide for the services and counseling necessary for developments like ours where there are high concentrations of citizens in the categories under study should come from a Fedeal level.

(5) Housing of institutionalized. Finally, we would like your committee to consider the urging of the medical facilities involved to consider the housing

of many patients in the geriatrics hospitals into adequate housing as public housing can provide.

We have recommended to the Hudson County Freeholder Board that they consider the possibility of releasing some of their patients, possibly even two unrelated persons whose admission is now permitted under the law to public housing units.

We feel that accommodations in units such as our would (1) provide the dignity of a home; and (2) reduce the cost of maintenance of such patients in

the county hospital.

It is my understanding that the cost of caring for a patient in a hospital is \$190 per month, or \$380 for the maintenance of two persons who could be maintained in a public housing unit at perhaps a combined outlay of about \$200 for food, shelter, and clothing, provided through the welfare board charged with their needs.

Regarding this point we quote from page 15 of the New Jersey Commission To Study the Department of Institutions and Agencies, 1959 report on organiza-

tion for social welfare, under programs for old people:

"No one who has visited the senile wards of a State hospital can fail to form the opinion that many of these older patients are not deranged, but have simply become incapable of sustaining day-to-day existence in close quarters with normally active people, and of meeting the complex demands of the modern rapid-fire world in which most of us live. Their needs are very different from those of patients suffering from acute mental disturbances. Often their physical infirmities are as distressing as their mental peculiarities, and may be confused with them. Too often they are denied the comforts of old age, of which they need not be deprived when the proper environmental aids are made available to them.

"If large numbers of our seniles could be moved out of permanent residence in the State hospitals and provided with day care, transportation to and from home, and medical attention specially designed for their needs as they gradually deteriorate with age, we should find, as others have found, that they can live out their lives in dignity and in freedom. This would also free the State hospital beds, which they were destined to occupy for years on end, for the acutely ill."

We hope our request will be favorably considered as we feel certain that with cooperation on all levels public housing can again demonstrate their de-

sire to aid.

A minor point, but perhaps an important one can be that it be a requirement that a citizens' committee be at work in each county if assistance from a Fed-

eral level is to be granted.

One of the requirements of the urban renewal program is that such citizens' committee composed of various groups be operating before grants are made for building funds. If such a committee is required on a Federal basis to build or rebuild cities, I believe a same type group should be required to help build or rebuild lives. In this manner committees such as yours could get a combined picture of the needs from such a central committee which would also assure fullest utilization of all community facets available to those who need rehabilitation.

I know here in Hudson County no coordinated council of social agencies is in operation which would serve as a clearinghouse for subjects under study by

your group.

In closing, however, I would like to make known my feelings that the prestige of your subcommittee conducting hearings here in our county may act to stimulate the renascence in the working objective of coordinated welfare activities.

Your group is to be congratulated for the tremendous task of conducting these

hearings in deciding the merits of recommendations made.

I have witnessed on many occasions the effects of an implosion upon the family when they are struck or confronted with some of the problems you have under study today. Many who I have talked to have found some comfort in the last week when they read that these hearings are being conducted. One of those who I have spoken to is our friend "Neil G." who we in housing are attempting to aid further by permitting him to have a candy and newsstand in our new 712 apartment Currie's Woods development. The New Jersey Rehabilitation Commission is requesting such permission under its vocational rehabilitation program as this youngster has such a strong desire to be on his own, despite the handicap of being a quadruplegic.

For studying such problems and aiding and encouraging the handicapped you are to be complimented. You are striving to help those who want so badly to help themselves.

Mr. Daniels. Our next witness is Miss Agnes Thompson, principal,

A. Harry Moore School, Jersey City.

We have quite a number of witnesses scheduled to testify today. If we are going to get through here at a reasonable hour this afternoon, it will be necessary to limit the testimony of the witnesses.

If you have a prepared statement, you may submit it to our reporter. I may suggest that you summarize the contents of your statement and your prepared statement will be filed in the record following your

oral testimony.

However, you may proceed in any manner you see fit, but I must limit your testimony to 10 minutes.

Miss Thompson, you may proceed.

STATEMENT OF AGNES THOMPSON, PRINCIPAL, A. HARRY MOORE SCHOOL, JERSEY CITY, N.J.

Miss Thompson. I don't think I will take more than three.

I am here, first of all, not as a financier, not as a legislator, so I don't know what to tell you about what I think should be done, but I will tell you what our situation is, what we think our needs are.

I have jotted down on some cards some pertinent facts, but I do not

have a prepared statement.

You may go into a normal public school of so-called average children and certainly not find what we need. We need therapists.

The other day at Philadelphia I noted one person said, "I can use five"; another person said, "I can use five." I said, "We can use three."

The people in charge of therapy schools are talking about you do have the dearth of personnel in your schools. They think you people

do a good job on recruiting personnel.

I got very practical. I said I thought if you paid them a decent salary you would get the personnel. They are requiring physical therapists to have a college degree from the college of physical or occupational therapy, yet they start at \$4,000. This is rather ridiculous for highly trained personnel.

Mr. Elliott. May I ask this question, Miss Thompson: How long do you have to go to school in the therapy field after you have your

college degree?

Miss Thompson. It is approximately 2 years in the school. New Jersey requires that we have registered therapists for school physical therapists and occupational therapists.

Mr. Elliott. Do you think that if salaries were higher, you would

automatically get plenty of therapists?

Miss Thompson. I think you would be able to get them and keep them. I know we have lost one in our school because he went to another system where they have their therapists on the same salary schedule as the teachers.

I know we lost another because he can make more in private re-

ferrals from other doctors.

We had a candidate, she would not think of taking it because she is in one of the large New York hospitals where she gets private patients after they are discharged from the hospitals.

So our salaries in the institutions must be higher in order for us to keep a highly trained professional staff.

Mr. Daniels. What do you feel would be a fair and reasonable

salary in this area?

Miss Thompson. I advocate, because they have training, educational requirements commensurate with the salaries, that they be put on the teachers' salary schedule when they have comparable training.

There is a need too in our schools for medical attendants because

with the exceptional child a person must take the braces off.

We have many children who must be fed. During the schooldays the medical attendants feed the children, remove braces, take care of their toilet care, dress them and so on.

Of course, another thing which makes the course in special education

much higher is the fact that we must have smaller classes.

I recall on one occasion saying to a director of special education, "I think that teaching three average children is similar to teaching

one cerebral palsy."

He corrected me and said, "I think the ratio, Miss Thompson, is 4 to 1." In addition to the fact that our classes must be smaller, we have a slight extra compensation that we in Jersey City pay to the

teachers in our special education program.

Some who spoke the other day in Philadelphia about status, I think if that could be arranged, if they could get a little extra compensation for the extra training that is required because they are required to have special education training in addition to their teacher's certificate, I think that that would give the status.

I am proud enough to think that we in Jersey City do have status, those of us who are affiliated with our special education program.

Because the multiple handicaps are frequently associated with cerebral palsy you must frequently take a child and instruct him in-

dividually.

I recall in my teaching days having a child with cerebral palsy who had never spoken a word because she had never heard the word. We first had to train her in the use of a hearing aid and gradually her

vocabulary was built up.

There is a study in New Jersey by Dr. Hopkins, the former principal of the A. Harry Moore School; Dr. Byess, who is now the consultant for the Crippled Children's Commission, and Miss Carlton, former teacher in the A. Harry Moore School. They made a study of 1,000 cases in the New Jersey files and of the children in the A. Harry Moore School. I have a copy of that study here if you would like to have it. It will point up the need for special education in those places.

I have jotted down a few items that we need in educating and

rehabilitating these children.

For instance, a wheelchair costs approximately \$150.

Knowing that I was coming here this morning, as I walked out the front door yesterday afternoon of the school, I looked around there, and I said there is about \$4,000 in wheelchairs standing there ready for the children to come in this morning.

Ear training equipment is approximately 300.

Electric typewriters: Some of the cerebral palsy cannot write; some can use the standard typewriter; others do not have sufficient strength so they must use electric typewriters.

Parallel bars to teach them to walk, safety training steps: It is a very easy matter for a child to walk up and down the steps. Here we have to spend \$260 to get these steps to train these children on so that

they can learn that very necessary thing.

There are a number of tables to teach the children to feed themselves, to button themselves, and again I started by saying I was not a financier; I think that the Federal Government could and should assist any agency conducting such a program of education for the special children.

As I think of it, I think they might reimburse the agency who has that program by giving them a percentage of the excess cost of edu-

cating these children.

Now, I do not think we are asking really a favor there, because when we educate these children they become self-sustaining members of society. They are not age burdened, they do not have to be placed in institutions.

In most instances they are not collecting the social security that

is given for a dependent child of a retired social security worker.

Again I have jotted down some of the occupations in which we find our graduates. I think of one who took mechanical dentistry training while a member of our school. He today owns his own laboratory and employs some of the members of our school, as well as others, one of

whom I hear is earning \$165 a week.

The cerebral palsied, and we emphasize them because they are the greatest, I think, educational problem facing us, we had 83 graduates between 1936 and 1957. Of that number, 43 were working at the time this was done in 1957; 18 were still in high school and colleges; 4 were married women who did not go to work, 2 received rehabilitation training, 12 were homebound, and 1 was in a mental hospital.

I think that is a small percentage because I think the training they have received has made them successful and as a result they do not have the frustrations and the emotional problems that would ordi-

narily go with that disease.

Among our graduates we number commercial artists, insurance adjusters, IBM operators, accountants, designers, physicians, chemists, chemical engineering, teachers, pharmacists, and various skills, office and unskilled workers.

I don't know whether I have answered any of the things you want

to know. I think we could use a greater therapy program.

I think that the Federal Government might consider reimbursing us. I think I have pointed out that those people are paying income taxes.

The Veterans' Administration has figures on that several years ago of how the person who was rehabilitated, a veteran, in a short time repaid in income tax the money that had been spent on him.

We like to believe that we are doing something similar.

Mr. Daniels. Thank you, Miss Thompson.

Are there any questions?

Miss Thompson, in the course of your testimony you referred to a study made by Dr. Hopkins, former principal of the A. Harry Moore School.

Miss Thompson. Yes.

Mr. Daniels. Do you desire to file that with the committee?

Miss Thompson. Yes.

Mr. Daniels. Without objection, that may be done.

Miss Thompson. I also have here a booklet which is not up to date. It is a 1943 booklet, but it shows you many of the facilities of the A. Harry Moore School.

Would you like me to leave that?

Mr. Daniels. You may leave that for our study.

Thank you very much, Miss Thompson. Miss Thompson. Thank you, sir.

Mr. Daniels. Our next witness is Dr. Henry H. Kessler, Newark, N.J.

Dr. Kessler, are you the famous Dr. Kessler of the Kessler Institute?

STATEMENT OF DR. HENRY H. KESSLER, NEWARK, N.J.

Dr. Kessler. I am Dr. Kessler of the institute. I do not know how famous I am. I have the dubious distinction of having been in the field for 40 years.

Mr. Daniels. We are honored by your presence.

Dr. Kessler. You are welcome.

The older I get the less I know. However, I have followed the evolution of the care and education of crippled children and physically handicapped people for the past 40 years and it is a beautiful story to see how government and community agencies have worked together to solve some of the problems.

Originally, of course, the only services rendered physically handicapped men, women, and children were in the field of asylum and care, but today we see that constructive efforts in the field of attempting to make these individuals self-supporting members of the community

have borne fruit.

There are still many gaps. There are certain special fields in which I am particularly interested and perhaps I had best confine my re-

marks to those one or two small areas.

I am referring to the children born without limbs. So-called congenital amputations, and children who have certain congenital defects of the cord known as spinal hemiplegia. This is a condition where lower extremities are paralyzed and the children have no control over bowel and bladder.

They are similar to adult paraplegics, but they are a group of chil-

dren that have been overlooked for long periods of time.

Now, the problems involved are both problems for the child and problems for the parent. The mother will come to me with a child born without arms and legs as a doctor, "Why did this happen to me? What sin did I commit to make me the victim of this horrible catastrophe?"

I will try to reassure her and say this was no sin, this was a biological accident. It is just as much an accident as walking across the

street and getting struck by an automobile.

They say, "What can you do for my child?"

I throw up my hands and say, "I don't know. I have been in this work for many years, but I have never had this experience. There is nothing in the books to tell me what to do."

But I said, "I am learning every day, from other similar disabled

individuals, how to meet those problems."

Here, for example, is a man, an adult paraplegic, who has lost both

legs at the same time. You watch him.

She was able to see how this man could get into his own artificial legs without assistance; get up from the floor with his own crutches, and walk up and down a short flight of stairs.

Then she said to me, "What will I do about arms?"

We were able to demonstrate to her a man and a woman with an arm off at the shoulder in whom we had utilized the chest muscle, made a channel or canal through it and attached an artificial arm.

Finally she said to me, "Doctor, shall I have any more children?" "Well," I said, "medically the odds are against you. Theoretically if you were to have eight children one out of every eight will be born with a physical handicap." One of the mothers in the room said, "Doctor, I think I can answer that question better than you can."

"What do you mean?"

"I was faced with that problem 15 years ago when my daughter was born without a hand. I have had three children since; they are perfectly all right. I would say to that mother, you go ahead and have children."

She had a second child, a perfectly normal child.

These are the problems of anguish and despair that face the mothers unless they know there is some hope for their child. That hope can only be realized by the establishment of facilities where the severely disabled children can be taken care of and those facilities are available today throughout the country in the form of rehabilitation centers.

Rehabilitation centers provide not only medical services, but they are facilities for providing really special education, special education not only in the academic field, but particularly in the field of self-

help and personal independence.

The important thing is to make these individuals independent and not requiring any assistance from their parents. So we teach these children, adults, others, how to take care of themselves, teach them

the pursuits of life or activities of today, day to day living.

Similarly the child born with congenital deformity of the spinal cord requires a long system of training, special education, if you please, to take care of themselves to learn how to walk with crutches, to get on and off buses, how to meet the problems that everyone meets in the routine pursuits of life.

There are more than 77 accredited, well-developed rehabilitation centers throughout the country, but they are all struggling, they are all struggling with the problems of personnel, but primarily problems.

of finance to keep going.

Very few of them get any subsidies from either State or Federal

agencies.

The Federal Government might very well direct its attention toward providing assistance to these well-qualified and certified agencies who are carrying on a program under great difficulty, but a program that cannot be carried out in any other way.

It is true that the State government, the county government, provides some financial assistance, but the administrative problems involved in providing assistance sometimes militate against the ulti-

mate rehabilitation of the child or the adolescent.

The budgetary restrictions, administrative regulations, the problems with the cerebral disabled are so great that it frequently makes it difficult for an administrator or a civil servant to undertake these gargantuan problems when there are other problems of a less difficult nature that demand his attention.

Now my point, therefore, is to suggest and submit to you the importance of giving aid to these rehabilitation centers who have taken upon themselves this responsibility for taking care of the needs of these severely disabled—a congenital amputee, spinal hemiplegia, the

cerebral palsy.

Mr. Daniels. Thank you very much, Doctor. I had the privilege of visiting your institute. You have a very unusual setup. I have heard many fine complimentary stories about the institute you operate.

I want to thank you for coming here today to give us the benefit

of your views. Thank you very much. Dr. Kessler. Thank you very much.

Mr. Giaimo. Doctor, can you make a suggestion to us as to how we can get more interest on the part of many States so that they will begin

to subsidize some of these agencies that need help?

Dr. Kessler. For 40 years we have been carrying on a program of education-education of the man in the street, public citizens, employers—but our problem has been a problem of overcoming prejudice.

The man in the street regards a crippled child or a crippled adult as in league with the devil, with sin, malignantly or evil spirits.

This is a sad commentary on civilization, but apparently we have not progressed much since the day 2,000 years ago when the child born with a cleft palate or club foot was thrown over the cliffs by the Spartans.

Two years ago in south Africa I spoke to tribesmen that happened to have a crippled child born in their tribe. They tie the child to a goat, they tie the goat to a stake, and leave them both out in the

wilderness for animals to consume.

Here we have 2,000 years of education and development and cultural improvement, but we still use aphadistic and primitive attitudes

in prescribing the needs of these children.

It is for that reason we find employers unwilling to hire handicapped people. They will rationalize this prejudice. They say, "I would like to hire this man, but I am afraid he cannot do a good day's work; I am afraid that he is accident prone; I am afraid that the insurance company will raise my premium."

What they really mean to say is, "I hate to have a cripple around."

I have been in this work for 40 years trying to spread the gospel here and all over the world and then this happened to me. My son was in England learning how to make artificial limbs. He wrote home, "Dear Dad, dear Mother; I have found a girl I want to marry. She is an amputee."

My friend said, "Look here, Henry, aren't you carrying this a little bit too far? You are not going to approve, are you? Haven't you done enough for cripples of the world without bringing them into

your own home?" My wife and I were in a spot. We went to England and saw this

girl and we fell in love with her. I said to my son, "Jerry, if you don't marry her, I will."

They are married today and she has given me two beautiful

dividends in the form of grandchildren.

Primarily there is a deep monstrous prejudice responsible for this apathy and indifference. I hate to inject at this time a little poetic reference, but there was a Polish poet who said:

Fear not your enemies for they can only kill you. Trust not your friends for they will only betray you.

But worse than death, and worse than betrayal, is indifference.

And this is a disease that unfortunately our body politic is suffering from.

Mr. Daniels. Are there any questions?

Mr. Elliott. I would like to compliment Dr. Kessler on his testimony, and to compliment more deeply and sincerely for the fine work that he is doing at the Kessler Institute. I think his accomplishments there are wonderful. I think he has demonstrated in his testimony the spirit which animates his endeavor at Kessler and makes it live and have meaning in our generation.

Dr. Kessler. Thank you very much, but there are 77 other re-

habilitation centers in this country. They all need help.

Mr. Daniels. Thank you very kindly.

Our next witness is Walter R. Cohn, president of the Jewish Voca-

tional Service, Newark, N.J.

Mr. Cohn, I understand that associated with you in your presentation today is the Honorable Harold Ackerman, chairman of the legislative and legal committee.

Are both of you going to testify?

STATEMENT OF WALTER R. COHN, PRESIDENT, JEWISH VOCATIONAL SERVICE, NEWARK, N.J.

Mr. Cohn. No, I am just going to testify, but I brought Mr. Acker-

man in case there are any questions.

Mr. Elliott. Both of you have been allocated a period of 10 minutes. I must hold you to that rule because of the limitation of time. Mr. Cohn. It is difficult to follow a man like Dr. Kessler in testify-

ing on a subject such as this, but I will try.

I am president of the board of trustees of the Jewish Vocational Service of Essex County. I have with me Judge Harold Ackerman, of the workmen's compensation court of the State of New Jersey, a

member of the board of trustees.

This agency, the Jewish Vocational Service of Essex County, has been rendering employment, counseling, and rehabilitation services to the Essex County community for the past 20 years; since 1947 we have given special emphasis in services to the handicapped and those people with special problems.

During this latter period over 10,000 clients have been served by the agency, 8,000 in connection with employment, with over 3,000 placed

on jobs.

Of these numbers, 80 percent served have been handicapped individuals, those with special problems and of those placed, 90 percent were handicapped.

The agency operates in four general spheres of operation, job placement, vocational counseling, psychological services, and we run a rehabilitation workshop.

This workshop originally was formed for the purpose of serving handicapped people. The emphasis has changed in the last few years to serve those who can be rehabilitated.

We have changed our policy not through desire so much as through

necessity and want.

Our census at the present time runs between 28 and 30 people. This, again, is not because of need, but because of economic limitation. We have an agreement with the New Jersey Rehabilitation Commission which was signed in 1957 which makes our workshop a nonsectarian agency and which permits us to offer evaluation and rehabili-

tation services through the program.

We give special emphasis to people with emotionally handicapped problems. Recently in June of 1959 our agency was awarded a research grant of approximately \$20,000 over a 3-year period by the U.S. Government through the U.S. Office of Vocational Rehabilitation to study the effectiveness of the rehabilitation workshop and the rehabilitation program of psychiatric patients released from mental hospitals.

We are presently engaged in a study of the use of the workshop on the schizophrenic patient. We are doing this in a joint program

with the Essex County Hospital.

We are also in agreement, a written agreement, with the Veterans' Administration locally whereby we give service to the patients of the

Veterans' Administration after they leave the hospital.

Now I cite these brief facts in order to give you a background of our agency and to establish the fact that over the past many years we have a specialized experience in dealing with rehabilitation problems

with the severely handicapped.

We have examined the bill, H.R. 3465, closely and I appear here today to express our conviction that this bill should be passed and passed as soon as possible. This bill will fill a much needed gap in the existing Federal legislation and will help assure us that there is a wellrounded and comprehensive program of rehabilitation services to the handicapped people of our country.

I will make some brief observations with regard to the specific

provisions of the bill.

With respect to the evaluation services as provided for in the proposed bill, I would like to observe that over the past 7 years our workshop has been doing this type of work with potentially rehabilitatable people who are handicapped with a variety of disabilities.

We are limited, of course, because of the fact that we must use as subjects of our program people who are rehabilitatable. This limits us so severely that we cannot take care of thousands and thousands of people who would be potentially useful to the community if we were able to give services to them, not toward the design especially of rehabilitation to industry, but to rehabilitation to themselves, to the community.

We feel this proposed bill would permit us to do that.

In the present bill, extending this diagnostic service that we are presently giving to our subjects and to our clients would permit us to extend the program to severely handicapped people who are both institutionalized and are homebound and would increase the number of individuals who could be evaluated with the eventual hope and

knowledge that we could rehabilitate these people back to society to serve useful purposes.

The bill would also create a centralized agency for information

which we feel most essential under the present conditions.

A second major provision that we are heartily in favor of is the provision that would rectify the situation where service is now denied to people who are not able to be rehabilitated through vocational rehabilitation. Our own program has convinced us conclusively that many severely handicapped individuals could be rehabilitated although they could not be immediately rehabilitated to employment. They could gain employment in a sheltered setting either within an institution or within a sheltered workshop.

The funds that this bill would provide would go a long way toward helping us in completing our program to give such service to people who could not be immediately rehabilitated to the industry, but

could be rehabilitated to the community.

In our case experience we find that the disabled groups who would benefit from this extension of service would include the mentally ill, the mentally retarded, the cardiac, hemiplegics, aged, and socially maladjusted.

Another provision of the bill which we are heartily in favor of, of course, is the extension of the rehabilitation services through workshops and rehabilitation facilities. Our own workshop has during the past 7 years demonstrated the need for a long term and a terminal

workshop.

Our original experience with the workshop was that we would emphasize the long term, the terminal case, the one that could not be rehabilitated, the one that could gain some self-respect by employ-

ment, although they could not get it in industry.

We, as I say, have had to limit our sphere of activities in this particular phase of rehabilitation because of limitation of funds. The passage of this bill, we know, would enable us to go back to what we feel a most necessary and vital need in the community, the rehabilitation of people in a terminal workshop where they could not be immediately employed in industry and where the emphasis was not rehabilitation for industry as such.

Our specialized experience with the psychiatric patient convinces us that this bill would permit the extension of funds so that we could complete what we hope would be the results to be gotten from the study we are now making as a result of our grant from the U.S.

Government.

The rehabilitation program which now is geared for a short period of time in our workshop, 1 year or less, depending on the patient, could be extended so that the psychiatric patient, the emotionally handicapped and such persons as the cardiac, could be rehabilitated over a long-term program as well as the terminal case.

We would like to recommend also the establishment of sheltered workshops and institutionalized settings, such as hospitals and homes

for the aged and convalescent homes.

In the past few months we have had requests from the home for the aged of Essex County to have a workshop set up in their institution. We feel that the passage of H.R. 3465 would implement greatly the work we are now doing and we strongly advocate its passage. Mr. Elliott. Thank you.

Do you desire to file a statement?

Mr. Cohn. I have a statement to file which extends my remarks and gives case histories to back up the points I have made.

Mr. Elliott. Without objection, your written statement will fol-

low your testimony.

Mr. Cohn. Thank you.

(The statement referred to follows:)

JEWISH VOCATIONAL SERVICE, February 19, 1960.

CARL ELLIOTT.

Chairman, Subcommittee on Special Education, Committee on Education and Labor, Congress of the United States, House of Representatives, Washington, D.C.

DEAR MR. ELLIOTT: On behalf of the Jewish Vocational Service of Essex County, I am submitting for the record testimony in support of H.R. 3465, the

Rehabilitation Act of 1959.

The Jewish Vocational Service of Essex County has been rendering employment, counseling, and rehabilitation services to the Essex County community for the past 20 years. Since 1947 it has given special emphasis in its services to the handicapped and those with special problems. During this latter period over 10,000 clients have been served by the agency, 8,000 in connection with employment, with over 3,000 placed on jobs. Of these numbers, over 80 percent served have been handicapped individuals or those with special problems, and, of those placed, 90 percent were handicapped.

Since 1957 the agency has been working in close cooperation with the New Jersey Rehabilitation Commission and has offered evaluation and rehabilitation services through its opportunity workshop program (a diagnostic rehabilitative workshop) with special emphasis on services to the emotionally handi-

capped.

More recently, as of June 1, 1959, the agency was awarded a research grant of approximately \$90,000 over a 3-year period by the U.S. Office of Vocational Rehabilitation, to study the effectiveness of a rehabilitation workshop in the vocational rehabilitation of psychiatric patients recently released from a mental hospital. This is a joint cooperative program with the New Jersey Rehabilitation Commission and the Essex County Overbrook Hospital.

I cite these brief facts about the agency in order to establish its specialized experience over a long period of time in dealing with the vocational rehabilitation

problems of the severely handicapped.

After close examination and careful study of the proposed bill, H.R. 3465, we are convinced that, if adopted, it will go a long way toward filling a much-needed gap in existing Federal legislation and will help assure a well-rounded and comprehensive program of rehabilitation services to the Nation's handicapped citizens.

I should like to make some observations with respect to specific provisions of

the bill:

TITLE I. EVALUATION SERVICES

Over the past 7 years our rehabilitation workshop, the Opportunity Workshop, has been doing evaluation and diagnosis of the vocational rehabilitation potential of handicapped individuals with a variety of disabilities. In this connection we have noted that, as our experience in this phase of work has increased, we have been able to deal with more severely handicapped individuals who in the past might have been considered too disabled to be helped by our services. (See case I attached.)

The present bill, by extending diagnostic services to the severely handicapped in both institutionalized and homebound settings, would thereby greatly increase the numbers of these individuals who could be evaluated, made more self-

sufficient, and ultimately be rehabilitated.

If we interpret the provisions of the bill correctly, it will also serve to centralize the evaluation and referral process in our respective communities and eliminate some confusion and weakness which presently exists in this area.

TITLE II. INDEPENDENTLY LIVING REHABILITATION SERVICES

The second major provision of the bill would help rectify the situation where denial of service is now the case for many individuals who could secure substantial benefits from rehabilitation and who may eventually even prove themselves to be capable of vocational rehabilitation. Experience in our own program has proved conclusively to us that many severely handicapped individuals who may not be immediately capable of returning to remunerative employment can still be helped considerably to improve in their functioning capacity and may even ultimately be able to sustain employment in a sheltered setting, either within an institution or in a sheltered workshop in the community.

From our case experience, among the disabled groups that would benefit by this extension of service are the mentally ill, mentally retarded, cardiac, hemaplegic, orthopedic, aged, and socially maladjusted. Extension of independent living rehabilitation services to the institutionalized and homebound would result in improving the condition of a great many such individuals and ultimately re-

duce the cost of such services to their families and to the community.

same time provide them with dignified remunerative employment.

TITLE III. WORKSHOPS AND REHABILITATION FACILITIES

The third major provision of this bill would provide the answer to a long-felt unmet need for additional rehabilitation facilities for the severely handicapped. Our own Opportunity Workshop rehabilitation program over the past 7 years has clearly demonstrated the need for more long-term or "terminal" workshops for the severely disabled. A substantial percentage of those individuals served in our workshop and similar programs have been able to achieve marked gains in functioning level and overall improvement in work adjustment without being able to attain the level of work competence required by private industry. If more long-term workshop facilities could be provided to these individuals it would enable them to sustain the gains achieved in these programs and at the

Our specialized experience with the psychiatric patient, in both our workshop and research project programs, appears to point up this need for a long-term facility for many psychiatric patients who ultimately might be rehabilitated. Since most of our present rehabilitation programs are geared to a relatively short time span of up to 1 year, many of the gains made by patients in this program are nullified or dissipated by the necessity of curtailing services to them beyond the officially approved period of time currently supported by the state rehabilitation agency. Cases II and III (see attached) are brief illustrations of psychiatric cases served in our Opportunity Workshop-Jewish Vocational Service program. They demonstrate that, where extension of service is given beyond the customary time, ultimate rehabilitation may be achieved. Thus, for example, in case II, successful rehabilitation was achieved in less than 11/2 years' In case III, significant progress is still being made, with eventual hopes for rehabilitation still a possibility. It should be noted that, were the workshop facility not available in the community, neither case (based on past case histories) would have been able to remain out of the hospital for any significant period of time.

Case IV illustrates the need of marginally functioning ex-mental-hospital patients for sustained sheltered employment. This service is often the key factor in preventing hospital readmissions. The benefits derived by the individual

and the community are manifold.

We would also recommend the establishment of sheltered workshops in institutionalized settings, such as hospitals, homes for the aged, convalescent homes, etc. It has been demonstrated, for example, that where a home for the aged in the Midwest developed a sheltered workshop program on a half-day basis, it was able to dispense with the services of two nurses, because of the diminished requests for medical and nursing care on the part of residents. Of course, the benefits gained in added physical well-being, as well as of dignity and feeling of usefulness on the part of residents, is self-evident. In the case of hospitals tied in with rehabilitation programs in the community, a sheltered workshop for chronic cases would eliminate the need for costly evaluation services which could be performed in the institutional setting.

In summary, therefore, we strongly urge the passage of H.R. 3465. Implementation of its various provisions would ultimately result in economies to the com-

munity and immeasurable dividends of improved health, both physical and mental, on the part of many individuals, increased earnings resulting in self-sufficiency for many others, added human dignity and increased well-being for many families and the community at large.

I sincerely hope that you and your committee will do everything possible to

facilitate the passage of this vital piece of legislation.

Sincerely yours,

WALTER R. COHN, President.

Case Illustrations in Connection With Testimony Relative to Bill II.R. 3465

CASE NO. 1

(Illustrates the need for evaluation services for the severely handicapped)

Mr. R is a deaf-mute with Parkinson's disease. He has a deaf-mute wife and two children. When first seen by the Jewish Vocational Service he was receiving public assistance in his local community. He came to us for job placement.

In his first interview his inability to communicate and a severe tremor in his left hand raised questions as to his employability. In order to assess his current level of employability, he was accepted for an 8-week diagnostic period in our opportunity workshop diagnostic rehabilitation program, under sponsorship by the New Jersey Rehabilitation Commission. During this 8-week evaluation he evidenced ability to perform gross motor tasks, such as packing and shipping. In fact, it was observed that when he was engaged in such tasks his tremor diminished. It was also observed that in a work situation he was able to communicative adequately, partially through lipreading and partially through primitive sign language.

Toward the end of his evaluation period the personnel director of a local concern was invited to visit the shop in order to observe him at work. The employer was quite impressed with his job performance and hired him. This same employer also informed the shop supervisor that, had he seen this client in a normal referral situation in his office, he would have turned down his application without any consideration whatsoever, because of the negative picture he presented

in a formal interview.

CASE NO. 2

(Illustrates the need for extension of customary time limits of service for psychiatric patients)

Mr. M. is a 24-year-old single man who was referred to the Jewish Vocational Service while still a patient at Essex County Overbrook Hospital. His prior work history was spotty and characterized by unskilled jobs of short duration. His early childhood was spent in a series of institutions, foster homes, and homes of relatives. At first contact, his family preferred that he continue to remain in the hospital. However, the hospital felt that he was ready for discharge, and, in cooperation with the New Jersey Rehabilitation Commission, he was referred to JVS for evaluation of his work potential in the opportunity workshop program. Through a special cooperative arrangement with the hospital and the New Jersey Rehabilitation Commission, he was permitted to remain in the hospital during this evaluation period.

As night be expected from his previous history, his progress in the workshop was slow but steady. On the basis of the improvement shown during the initial evaluation period he was discharged from the hospital and, with the help of their social service department, arrangements were made for him to live in the community. Although greatly improved at the end of the year, the client was not quite ready for private employment, and the agency retained him beyond the customary 1-year period normally authorized by the New Jersey Rehabilita-

tion Commission.

Following an additional 2 months' service he was successfully placed in private employment as a packer, where he is still employed. At this point we can report that he has been gainfully employed for over 6 months on the same job. It should be emphasized that, by continuing service beyond the customary period of time, a successful rehabilitation was effected.

CASE NO. 3

(Illustrates the need for long-term workshop services for severely handicapped mental patients)

Mr. J., a single man in his early forties, was seen while on leave from the New Jersey State Hospital at Greystone Park. He was accepted by the Jewish Vocational Service for our 8-week diagnostic evaluation in the opportunity workshop, under the sponsorship of the New Jersey Rehabilitation Commission. At the end of this evaluation period, due to the nature and severity of his illness, it was considered unlikely that this client could be returned to competitive employment within the 1-year period usually authorized by the New Jersey Rehabilitation Commission. In view of this, the commission terminated its sponsorship. Nevertheless, it was felt that eventual rehabilitation was still a possibility, without setting specific time limits. On this basis, he was continued in the workshop program.

After I year he is still not ready for employment but has derived the following

benefits:

(1) This has been his longest sustained period outside a mental hospital in the past 10 years.

(2) He is a productive worker in the workshop.

(3) He has opportunity for social contacts otherwise unavailable to him.

(4) He has accepted regular psychiatric help.

At the present time his psychiatrist reports little likelihood of a relapse.

This case illustrates that, in working with the severely handicapped, many important gains can be accomplished and much improvement effected in many areas of functioning, even though the goal of immediate employment may require deferment.

CASE NO. 4

(Illustrates the need for terminal workshops)

Mr. L. entered the Essex County Overbrook Hospital at the age of 48, after several years of marginal employment and existence following the death of his parents. Always a seclusive, inadequate person, with many problems, Mr. L. had managed to maintain some employment, and thus avoided becoming a community financial or social problem as long as his parents were available to provide a home. Without them, he was unable to face these responsibilities.

After 14 months of hospitalization he was released into the community on the basis of acceptance by the Jewish Vocational Service for its opportunity workshop rehabilitation program. Exposure to a workshop program, plus attempts at trial placement, indicated that Mr. L. could not meet the demands of competitive private employment even on a minimal level and was unlikely ever to do so. However, he demonstrated the ability to function in and derive satisfaction from the workshop program. Termination of the opportunity workshop program for him would unquestionably have resulted in rehospitalization. On this basis, he was accepted as a terminal employee in the workshop. He still lives a marginal existence but the workshop has added a meaningful dimension to his life. It not only provides Mr. L. with a minimum level of financial support, but gives him an opportunity to be purposefully occupied during the day. Despite his many problems, he has sustained this program for the past 3½ years. Without it he would undoubtedly have been reinstitutionalized. Public assistance alone would not sustain him, since it makes no provision for meaningful activity for him.

There are many more individuals like Mr. L. who could remain out of mental hospitals if terminal workshop programs were more widely available. The

savings in human resources and public funds are self-evident.

Mr. Elliott. Our next witness is Mr. Percy Clark, of the New

Jersey State Hospital, Marlboro, N.J.

Mr. Clark, I do not know if you were present earlier when I stated that each witness will be limited to 10 minutes in his testimony because of the large number of witnesses who have expressed desire to appear and testify here today.

If you have a prepared statement, I might suggest that you file the prepared statement with the reporter and summarize your views. Your prepared statement will follow your oral testimony in the record. Mr. Clark. Thank you.

Mr. Elloitt. Or you may proceed in any other fashion if you desire.

STATEMENT OF PERCY L. CLARK, OTR, REPRESENTING NEW JERSEY OCCUPATIONAL THERAPY ASSOCIATION

Mr. Clark. I do have a prepared copy that I will leave with the secretary.

I am representing the New Jersey Occupational Therapy Associa-

tion.

The following are the urgent needs that we have experienced and recognized as occupational therapists preparing patients to be more independent, responsible members of society.

More sheltered workshops are needed and we feel also that a job placement service should be an integral part of this program to help

shorten the time spent in the workshop.

One of the most urgent needs is the sheltered workshops accepting psychiatric patients who still require some supporting during the initial adjustment period in the community and at the same time give him an opportunity to contribute to his own support.

We also must meet the needs of those who cannot fit into competitive industry, such as those with progressive conditions who are not

eligible under the present legislation.

And those with multiple handicaps who can attain such measures

of self-support.

Secondly, we need more adequate professional services for the homebounds who with maintenance therapy administered in the home could be productive in homebound employment of a limited nature.

Thirdly, we also need have halfway houses for the individual without a home or family who could be discharged from the hospital either with a residual physical handicap or on a convalescent status from a mental hospital into a protective independent living situation, such as the loneliness of the feeling of rejection by society, especially with the psychiatric patient.

Also, some disabilities who may require some self-care. This type of setup would not require a highly trained person and this would not necessitate taking the professionally trained personnel from vital

rehabilitation centers.

Again we feel that more generous provision for prosthetic devices and orthopedic equipment services are needed for convalescent patients

who are not presently eligible.

Also, especially in the psychiatric area. We also feel that more counseling services must include the families of the handicapped in cases where the disability of the breadwinner necessitates a former dependent assuming the role.

Also, counseling the family to accept the shift in the roles. And

vocational counseling or training for the new breadwinner.

We also feel that one of the greatest needs is more professionally trained personnel. In occupational therapy alone there are job opportunities for 14,000 registered occupational therapists in addition to the present 6,106 registered therapists.

Also, enrollment in the occupational therapy schools has decreased due to high tuitions which may mean that some of the schools may

not be able to continue the curriculums.

Financial assistance is needed for extending recruitment and publicity programs.

Financial assistance such as tuition and living should be made available to potential students as part of the recruitment program.

Scholarships for graduate work for registered occupational therapists would improve the quality of professional services.

And higher salaries are required to attract and keep greater num-

bers of personnel.

Mr. Elliott. At that point what do you feel is the role of the Federal Government in this area?

Mr. Clark. We feel that under grants especially the recruitments could be assisted in getting more people interested and more people in the feel.

Mr. Elliott. Grants to colleges and universities to encourage study along that line?

Mr. Clark. That is right.

Mr. Elliott. Are there any questions?

Dr. Barnard. Mr. Chairman, I have a letter from Mr. Harold G. Logan, director, New Jersey Consultation Service for Convulsive Disorders. He would like to express his appreciation for being invited to testify before this subcommittee on this important legislation and present a statement regarding the program here in the State of New Jersey and the efforts of his clinic to work with convulsive disorder patients.

I respectfully request that Mr. Logan's letter and statement, be

made an official part of the record.

Mr. Elliott. Without objection, the statement of Mr. Logan and the formal statement of Mr. Clark, will be made a part of the record at this point.

(The statements referred to follow:)

State of New Jersey,
New Jersey Neuropsychiatric Institute,
Princeton, N.J., February 17, 1960.

Hon. Carl Elliott,

Chairman, Subcommittee on Special Education, Committee on Education and Labor, House of Representatives, Congress of the United States, Washington, D.C.

Dear Congressman Elliott: As director of the New Jersey Consultation Service for Convulsive Disorders and secretary to the Advisory Conneil of the New Jersey Consultation Service for Convulsive Disorders, I have been asked to express our appreciation at being invited to testify before the Subcommittee on Special Education at the eastern Atlantic region hearings in Jersey City, N.J. on February 18, 1960. We are submitting to the Subcommittee on Special Education the enclosed statement and material regarding this program which represents the State of New Jersey's efforts to work with our convulsive disorder patients.

This program represents some of the efforts of our State government, medical profession, and lay groups to better the conditions of the convulsive disorder patients. This is accomplished by making available to their physicians the latest medical advances in the field of epilepsy and by utilizing the services of a non-medical group to help these patients with problems of education, employment, rehabilitation and adjustment to living in the homes and communities.

The enclosed material will more adequately describe the activities of the New Jersey Consultation Service for Convulsive Disorders and its advisory council. Sincerely yours,

Harold G. Logan,
Director, New Jersey Consultation Service for Convulsive Disorders.

THE NEW JERSEY CONSULTATION SERVICE FOR CONVULSIVE DISORDERS

In 1950 it was estimated that there were approximately 20,000 persons with epilepsy in New Jersey. Studies made in other States indicated that many epileptics were denied education, employment, and the right to lead normal productive lives as members of their communities because of the lack of public understanding and the social problems accompanying epilepsy. It was also accepted that in most places there were not available the resources for the treatment of the medical problems. In our own State of New Jersey, we had one institution for epileptics, the State village at Skillman, whose function at that time was almost entirely custodial. It was generally felt that the situation in New Jersey approximated that in other States where more detailed studies had been made.

New Jersey currently has a traveling consultation service which meets five times each month in hospitals serving all of the health districts in the State. Dr. James F. Hammill, a noted neurologist, who in his capacity as chief epileptologist for the State department of institutions and agencies, sees patients who have been referred to the New Jersey Consultation Service for Convulsive Disorders by their private physicians. These patients, prior to being seen by Dr. Hammill, have had complete neurological examinations from a local "contact physician" who had been specially trained to work with the epileptic patients. The patients are also given electroencephalographic tests, and if necessary, X-rays, blood tests, etc. A trained psychiatric social worker has thoroughly interpreted the program to the patients and their families and secured pertinent material regarding their home, job and educational situation. At the actual clinic session, which is attended by professional observers, the patient's total problems are reported by the contact physician and social worker. Dr. Hammill examines the patient and discusses with him, the findings and answers the patient's questions regarding their condition. The patient is informed of the recommendations for treatment of his case and advised to return to his private physician to whom is sent the findings and recommendations. If the patient needs assistance in the area of rehabilitation, social casework, education, etc., this is also indicated to the referring physician and assistance is given in helping make the proper arrangements for his patient.

Credit for this program for convulsive disorders in New Jersey goes to the New Jersey Medical Society. Aware of the situation here in New Jersey, the idea for the program was created by the members of the subcommittee on public health of the State medical society in 1950. We here in New Jersey were fortunate in that one of our physicians had lived in Ohio where a program for epileptics had been in operation for a number of years. The Ohio program had been underwritten by the Ohio Chapter of the National Society for Crippled Children and Adults. After some months of discussion and study, the New Jersey plan was approved by the Subcommittee on Public Health, the Welfare Committee and the board of trustees, all of the New Jersey Medical Society. The proposed State plan regarding epilepsy was submitted to the New Jersey Chapter of the National Society for Crippled Children and Adults with a request for the financial and personnel aid required to put the program into effect after

receiving full approval of the New Jersey Medical Society.

Through the inspired guidance of Mr. Donald M. Smith, executive director of the New Jersey Society for Crippled Children and Adults, the proposed plan was given housing, publicity, direction, and agency sponsorship. Through funds made available to the New Jersey Society for Crippled Children and Adults by a group which had been formed in 1950, the New Jersey Society for the Welfare of Epileptics, the services of Mrs. Emma Galloway Cole, a medical social worker, were obtained as epilepsy project coordinator. Mrs. Cole was able to put into operation the program recommended by the New Jersey Medical Society.

In the beginning the program was mainly educational in nature and consisted of institutes held throughout the State and the dissemination of material regarding the epileptic and his problems. Funds for carrying out the remainder of the proposed program, hiring the personnel for the traveling clinics, were not available either through public or private sources.

In 1952, Mrs. Cole received an award from the National Institute of Neurological Diseases and Blindness which made it possible for her to visit other States across the country to observe firsthand their way of handling the problem of the epileptic. During this tour she was able to study in detail the program of the State of Ohio. Upon her return to New Jersey, a revised plan was recommended, patterned after the Ohio program but geared specifically to meet the needs of New Jersey. During this period, discussions were held with many of the leading authorities in the field of epilepsy who offered their comments and experience in the development of the traveling clinic plan being considered for New Jersey. This phase of the program was highlighted in 1953 by the State department of institutions and agencies which agreed to underwrite the salaries of the personnel which would make the consultation service as it

exists today a reality. In this same time period another very important development was occurring in New Jersey which aided the development of the consultation service and saw it emerge as a jointly sponsored activity of the department of health and department of institutions and agencies. The State Village for Epileptics at Skillman was reorganized and became known as the New Jersey Neuropsychiatric Institute and had as its function to promote research and study of neurological and psychiatric disorders. The population of the epileptic village was reclassified and patients were sent to the proper institution as needed or plans were made to return them to their homes and communities. At the same time the division of chronic illness control was organized as a unit of the State health department. Under its charter, the newly created division of chronic illness control felt that epilepsy was one of the diseases with which they should work. At this point, discussions were carried on by the department of institutions and agencies, department of health and the New Jersey Society for Crippled Children and Adults to coordinate their activities in this field. The medical society had recommended the setting up of an advisory council (see exhibit 4 and 5) which would serve as policymaking body for the consultation service. Through the cooperative efforts of the three agencies, the New Jersey Consultation Service for Convulsive Disorders was set up in 1953.

The department of institutions underwrote salaries of the medical consultant, the contact physicians, the psychiatric social worker, and clerk stenographer. The health department purchased and loaned to the hospitals selected as clinic sites, EEG machines and provided grants for the training of EEG technicians. The health department also provided printed materials, the planning for the April 1954, Governors Conference on Epilepsy and other vitally related services. The New Jersey Society for Crippled Children and Adults provided the salary of an educational-vocational counselor and office space for the program. After another period of discussion and training sessions, the New Jersey Consultation Service for Convulsive Disorders held the first practice clinic on November 5, 1953. Because of certain internal problems, no further clinics were held until March 1954, at which time the clinic program was begun with four clinics operating each month in each of the four State health The need for an additional clinic for the metropolitan health area was soon made necessary but it was not until January 1959, that the fifth clinic was set up. The four clinics and a description of the present program is described in exhibit No. 3.

Since the inception of the clinic program, the consultation service has made a most important contribution to the handling of the problems of the epileptics. The following chart will illustrate the statistical breakdown of the program.

Statistical table, May 1954 to June 1959

Number of doctors referring 1, 0 Number of patients referred 1, 2 Number of clinics held 2	69 21
Total patients examined (original and reexaminations) 1, 5 Number of visitors to clinic 4, 0	02
Family members1,5	_
Professional observers 2, 4	05

With the reorganization of the State village at Skillman, the consultation service was given two important tasks directly concerned with the New Jersey Neuro-Psychiatric Institute: all epileptics now seeking admission to the New Jersey Neuro-Psychiatric Institute are screened by the consultation service. Prior to taking on this responsibility, the annual admission rate to the Skillman village ran around 250 admissions per year with over 800 patients being maintained at the village as chronic institutional cases. Since the consultation

service has been in operation, the greatest number of admissions to the institute in any one year has been 12 admissions. These patients were admitted for intensive evaluation and treatment with the average time of residence being 3 months. After this period of inpatient treatment, these patients were returned to their homes and communities to continue living normal productive lives. These patients have ranged in age from 10 to 60 years of age. The other responsibility given the consultation service was to give followup services to those epileptic patients who had been returned to their homes and communities at the time of the village reorganization, thus insuring them one of the services, making it possible for them to continue as productive members of society.

Early in the clinic program, it was recognized that in order for the consultation service to render the most effective service to the epileptics, that a close tiein with existing community services would have to be made. This has been noticeably demonstrated throughout the operation of the program. An agreement providing for mutual referrals to the local offices of the New Jersey Rehabilitation Commission, State employment service, State mental hygiene and local mental hygiene clinics was initiated. This made it possible for the patient to receive the benefit of total available services as envisioned in the early planning for the program. In the area of special education, the consultation service has had a very practical and workable relationship with the director of special education in the State department of education. Through this relationship, the problems of the epileptic schoolchild have received firsthand attention and we now can proudly state that the epileptic schoolchild in New Jersey, with the resources of all of our State and private organizations, are now able to take their places in our educational system. Another very important adjunctive service rendered the patients was made possible by an agreement with the State department of health through its nursing program. Patients now receive nursing followup care in these cases where indicated with the approval of their family physician.

This program has been widely accepted by the physician in New Jersey treating the epileptic patient. A review of the preceding statistical table will show this as reflected in the numbers of referrals made by the physicians, and more importantly, by the fact that their patients have benefited through the services made available to them and their ability to resume their places in the lives of

their families and activities of their communities.

The early plan for the epilepsy program called for the organization of an advisory council to the consultation service. This council with representation from both public and lay groups, would serve as general policy making body for the epilepsy project. (See exhibits Nos. 4 and 5.) Through the efforts of this group, New Jersey in 1959 revised its statutes now making it legal for epileptics to marry. The advisory council has worked in other areas to help effect better legislation regarding the epileptics in the area of labor, rehabilitation, and education. The advisory council has also worked with the State division of motor vehicles to effect a better policy of issuing drivers licenses to the controlled epileptic.

The advisory council has played a most important part in the activities of this program. The wealth of experience that the members of the council have brought to play on the problems of the epileptic have clearly demonstrated the vulnerability of all diseases and illnesses when all of the resources in an area are combined to solve the problems presented by illnesses and disability. We feel that we have made a good start here in New Jersey and are looking to the future when we can feel that the epileptic patient no longer will have to contend

with the stigma so long attached to epilepsy.

Ехнівіт №. 1

THE MEDICAL SOCIETY OF NEW JERSEY—RECOMMENDED STATE PLAN REGARDING EPILEPSY

NEED OF AN EPILEPSY EDUCATIONAL AND SERVICE PROGRAM IN NEW JERSEY

It has been estimated nationally that there is 1 person afflicted with epilepsy in every 200 of the general population. If this is true, then there would be something over 20,000 epileptics in the State of New Jersey.

Studies elsewhere have shown that many epileptic persons are kept out of school or have been unable to get employment because of the lack of public

understanding of the disease and an organized approach to the social problems incident to it. There is also in most places a lack of organized methods to assure proper treatment of the epileptic as an individual.

The only institution for epileptics in New Jersey is the State village at Skill-

man and its function, at present, is almost entirely custodial.

Authorities say that 75 to 80 percent of all epileptics can lead a normal or near-normal life if treatment is available and applied to their cases and if the public understands their problem. Epileptic seizures can be completely controlled in more than half of all epileptic patients by adequate treatment with accepted medication.

Recent advances in diagnosis and treatment have altered the concepts that (1) epilepsy is usually associated with mental retardation, (2) no satisfactory

treatment is available, and (3) epileptics are chronic invalids.

The primary objective of an epilepsy program should be to make the public aware that the epileptic person should be treated as an individual and should not be rejected because of his disorder.

SUPERVISION AND DIRECTION OF THE PROGRAM

Upon approval of the program outlined below by the State medical society, these proposals will be submitted to the New Jersey Chapter of the National Society for Crippled Children and Adults with a request for the financial and

personnel aid required to put the program into effect.

In order to coordinate the interest and resources of all the agencies, public and private, which should be concerned with a statewide epileptic program, it is proposed first to establish and advisory council on the epileptic program to comprise representatives of the Medical Society of New Jersey, the New Jersey Chapter of the National Society for Crippled Children and Adults, the State department of health, and the State department of institutions and agencies, the State department of education, the State department of labor and industry, and the State rehabilitation commission.

Apart from and in addition to this council, there would be a medical advisory committee, the members of which would be designated by the Medical Society of New Jersey. All medical policies and any changes in medical policy shall be adopted by the council only after approval by the medical advisory

committee.

The council would select a coordinator for the entire program, whose salary and approved expenses would be paid by the New Jersey Chapter of the National Society for Crippled Children and Adults, if the program is accepted by that organization. (It may be found preferable, in this connection, to designate the executive director of the New Jersey Chapter of the National Society for Crippled Children and Adults as the coordinator for the program with the actual work to be delegated by him to a subordinate, specialized member of his staff.)

OUTLINE OF PROGRAM

1. The coordinator, with the aid and guidance of the council and medical advisory committee, will seek to enlist the cooperation of the medical profession, school authorities, health officers, and employment personnel in developing plans to aid the epileptic and to inform and educate the public and professional groups in the part they can play in helping epileptics to lead normal lives in school, at work or in the community.

2. The coordinator will maintain lists of treatment facilities and of physicians interested in treating epileptic patients. He will compile lists of private schools, camps, and other facilities where epileptics will be accepted. He will maintain an information exchange on employment, education, and legal questions concerning the epileptic.

erning the epiteptic

3. The coordinator will be available for consultation with epileptic patients, their friends and relatives, for advice on meeting individual or personal problems.

4. The coordinator will cooperate with the authorities in the department of institutions and agencies and with the medical advisory committee in helping to publicize and promote the use of such central treatment, clinical, and educational services as may be available under the department at Skillman Village.

5. Eventually, it is anticipated that the medical advisory committee will give consideration to the desirability of organizing demonstration clinics operating out of the treatment center at Skillman Village for instruction and consultation

purposes to assist physicians, nurses, teachers, etc., in handling problems of their

epileptic patients.

It is understood that treatment would not be given at these traveling clinics. Patients would be accepted by the clinic only on reference by private physicians and recomemndations would be sent directly to those physicians. Detailed arrangements as to engagement of a consultant, fees to be paid, and the relationship with private neurologists would be worked out in advance by the medical advisory committee.

It would be anticipated that a traveling clinic would enter a county only with prior knowledge and approval of the county medical society. A primary purpose of such traveling clinics would be to provide special services to physicians treat-

ing epileptic patients.

6. Special studies would be undertaken by the coordinator, the council and the medical advisory committee in relation to the educational needs of the epileptic child, the need for vocational rehabilitation and placement of the epileptic adult, and possible improvements in legal statutes governing epilepsy.

RECOMMENDATIONS

The advisory committee on mental hygiene has approved the epileptic plan as above presented and recommends that the public health committee approve it

and recomemnd its approval by the welfare committee.

NOTE.—This outline follows closely the program that has been developed and has been in operation for approximately 3 years in Ohio. Through correspondence with the executive secretary of the Ohio State Medical Association, we are assured that this program not only has been successful but highly satisfactory to the physicians in that State. In Ohio, the financial and personnel requirements of the program have been underwritten by the Ohio Chapter of the National Society for Crippled Children and Adults and the direction of the plan is in the hands of councils and committees comparable to those above proposed for operation of the plan in New Jersey.

Ехнівіт No. 2

THE NEW JERSEY SOCIETY FOR CRIPPLED CHILDREN AND ADULTS PLAN FOR NEW JERSEY CONSULTATION SERVICE FOR CONVULSIVE DISORDERS

THE CLINIC PLAN

The plan outlined below for community convulsive disorder clinics in New Jersey is the result of a study of such clinics in operation in 11 States across the continent. This plan has been approved by Dr. Robert Garber, superintendent of the New Jersey Neuro-Psychiatric Institute at Skillman, by the medical advisory committee of the epilepsy project representing the medical society of New Jersey and by the advisory council to the epilepsy project of the New Jersey Society for Crippled Children and Adults. It is based primarily on the Ohio plan for traveling consultation clinics, but modifies that plan by proposing permanent community clinics with a traveling rehabilitation team. The primary purpose of the community clinic and the rehabilitation team servicing it is—

To give expert consultation to physicians in the community in the treatment of patients with epilepsy, who may be unable, because of the patient's

economic status, to refer patients to a private source.

2. To demonstrate to other interested physicians, the most advanced methods of diagnosis and medical procedure for persons with epilepsy and to give interested nurses, teachers, vocational counselors, social workers, and other professional personnel interested in epilepsy the most advanced methods of care relative to their respective fields of endeavor.

3. To bring to the patient with epilepsy the ancillary benefits of a team whose function is to discover, initiate, and promote community services

leading to total rehabilitation.

THE CONSULTANT

Representing Dr. H. Houston Merritt, director of the service of neurology at Neurological Institute, Presbyterian Hospital, and professor of neurology at Columbia University, New York City, will be his staff member, Melvin D.

Yahr, M.D. Dr. Yahr will serve as consultant to the consultation-demonstration clinics, as leader of the rehabilitation team which will service the clinics, as director of the medical research anticipated as a function of the clinic and will add a continuous teaching element to the plan. This element will be effective especially in relation to the contact physicians working with Dr. Yahr but will also reach out to referring physicians and others who use the consultation and demonstration functions of the clinics. His activities as consultant will not involve direct treatment.

INCORPORATION OF CERTAIN PHYSICIANS AS KEY PERSONNEL

A local physician, preferably experienced in epilepsy, ready to learn and sincerely interested in the epileptic individual as a whole person will be chosen from each of four sections of the State known as health districts. In each district an accessible town with an available hospital or center, will be chosen, in consultation with the local physician, as a base or center.

SUGGESTED ORGANIZATION

This physician will be requested to act as key medical person for the traveling rehabilitation team in his area, e.g., Morristown for north Jersey, etc. He would be asked to be contact person in all of the relationships of the traveling rehabilitation team in this area, and if possible organize a seizure clinic in the hospital which he attends for indigents and medically indigent (such a clinic is not already operating).

COOPERATION OF LOCAL ORGANIZATIONS

Because there would be geographically relatively easy access to the chosen centers from all parts of each area, it is believed that the transportation problem will not be great. However, where such a local problem does appear the cooperation of the local county committee on epilepsy, which presumably has been previously formed, or the local chapter of the Society for the Welfare of Epileptics, where available, will be sought. Thus the responsibility in such local situations will continually be thrown back to the home base.

Experience in other States has proven the very great importance of keeping such responsibility at the grassroots. It will be the function of the contact physician to keep the local referring physician informed as to the best methods of treatment and to act as a readily available source of consultation, so that the local physician may be continually aided in the most recent and skilled methods of seigure control.

SELECTION AND PREPARATION OF CONTACT PHYSICIAN

The contact physician representing each of the four service districts will be chosen on the recommendation of his county component medical society on the basis of the following qualifications:

 An interest in convulsive seizure problems and a leaning toward neurology as an ultimate specialty. Interest in using new methods and medications for control of seizures under the guidance of the clinic consultant.

2. Availability of sufficient time to devote 1 full-day and several shorter periods each month to clinic activities.

3. Capacity to cooperate in a teamwork activity.

4. Age preferably not over 40.

Some special orientation will be needed in order that each contact physician will be fully prepared to work in harmony with the consultant. A series of half-day sessions for special lectures and clinic participation at neurological institute is given to the physicians chosen. Thereafter, these physicians will use the consultant with judgment, as needed. The training of these physicians will be such that they can provide some followup consultation to physicians who have referred patients to the consultation-demonstration clinic, and use consultation with New York with discretion in emergencies. It will be essential for them to be able to work efficiently with the newer drugs, also using the consultant as needed.

Benefits to the contact physicians will include therefore:

1. Special training course of 6 to 8 half-day lectures and practicum sessions at Neurological Institute, New York. Other special training opportunities.

2. Continual consultation and orientation in most recent methods of diagnosis and treatment of convulsive seizures.

3. Encouragement to develop a convulsive disorder clinic at an appropriate hospital in the area.

Probable retainer of approximately \$2,000 a year.

OPERATION OF TRAVELING REHABILITATION TEAM

A traveling rehabilitation team headed by the consultant epileptologist and coordinated by the coordinator of the epilepsy project, to serve the community clinics, is to be set up. A visit will be made each month to each district by the group, consisting of the consultant, coordinator, social worker and vocational counselor. To this team in each district will be added the contact physician of that area. Experience and practice in other States indicate that the electroencephalographer might profitably be included on this team and that an E.E.G. study should be done, if indicated. A psychologist and a nurse representing the locality from which the patient comes would also be valuable team participants. It is believed that the number studied in each clinic session may be rapidly increased without loss of efficiency through the continual close relationship which the contact physician will have with the team and the referring physician.

THE ELECTROENCEPHALOGRAPH MACHINE

Through the cooperation of the division of chronic disease control of the State department of health a plan is being worked out for greatly enlarged electroencephalographical services in each of the four districts. The division will install E.E.G. machines in hospitals where the need justifies such a loan of equipment. This will primarily be for the use of the consultation-demonstration clinic in this area but will also serve others. Grants-in-aid for technicians' services will also be supplied under this cooperative plan.

SUMMARY

The value of the new features of this plan lie in several areas:

VALUE OF NEW PLAN

1. The teaching element of the plan: The training and utilization of contact physicians which (a) brings consultation close to the referring physician, (b) keeps responsibility in the community (c) may prepare the contact physician to become consultant in his area at a later date.

2. The enlarged capacity of the clinic: The contact physician increases the amount of help available to the referring physician many times, and assures

prompt and readily available access to this consultation.

3. Assurance to local neurologists that the visiting neurologist as consultant, does not seek to replace them but does make readily accessible consultation in continual touch with developments in the most modern methods, for the use of

the family physician as well as for the specialist.

4. Continual development of work in epileptology: With the contact physician working closely with the consultant, the sharpening of special skills and the experience in teamwork approach to rehabilitation processes should make it possible for these men to replace the New York consultant in a few years time as was done in Ohio after the death of Dr. Jerry Price. Each one would then become a teacher of other future epileptologists. It is recommended that when that time comes, some regular refresher process be required of the physicians who take over as consultants to assure that, until New Jersey has its own school of medicine, the very latest treatment be continually available.

COST

The cost of this plan is being shared by the department of institutions and agencies (who will provide most of the staff salaries, through the New Jersey Neuro-Psychiatric Institute) the division of chronic disease control of the department of health (by supplying E.E.G. machines and facilities for them and a large share of the physical equipment, printed matter, etc.) and the New Jersey Society for Crippled Children and Adults which will coordinate the three agencies and supply part of the staff and office equipment.

Exact figures are not available at this time, but it is believed that by the cooperative plan now being set up a maximum of benefit with a minimum of loss through duplication and overlapping may be developed, all to the ultimate benefit of the person suffering from epilepsy and its attendant effects.

Ехнівіт №. 3

NEW JERSEY CONSULTATION SERVICE FOR CONVULSIVE DISORDERS

Medical Consultant, James F. Hammill, M.D.; director, Harold G. Logan, M.S.W.

This service is for consultation and demonstration only. Physicians may refer patients economically unable to be referred to a private consultant, by filling out and sending referral forms to the director. Referral forms may be secured from the local county medical society, from the District Health Office, or from the above address. If the attached information does not answer all questions, the director or the contact physician in your area may be addressed or phoned.

CENTERS AND CONTACT PHYSICIANS

Southern area. (Atlantic, Camden, Cape May, Cumberland, Gloucester, and Salem Counties):

Salem County Memorial Hospital, Salem.

William L. Sprout, M.D., Salem.

Metropolitan area. (Bergen, Essex, Hudson, and Passaic Counties):

Paterson General Hospital, Paterson. Melvin B. Robbins, M.D., Fair Lawn.

The Presbyterian Hospital, Newark. Francis Wood, M.D., Newark.

Central area. (Burlington, Mercer, Middlesex, Monmouth, and Ocean Counties); St. Francis Hospital, Trenton.

Arthur Randelman, M.D., Trenton.

Northern area. (Hunterdon, Morris, Somerset, Sussex, Union, and Warren Counties):

Morristown Memorial Hospital, Morristown.

Catherine Spears, M.D., Chatham.

SCHEDULE

On occasion, the clinics are moved from place to place. Persons desiring to attend clinic sessions should call the above telephone number to determine actual date and place of clinic.

First Monday of month: Southern area.

Second Monday of month: Metropolitan area.

Third Monday of month: Central area. Fourth Monday of month: Northern area.

NEW JERSEY CONSULTATION SERVICE FOR CONVULSIVE DISORDERS

What the consultation service is

The consultation service is designed to make available the advantages of newest medical and rehabilitation techniques to physicians and their patients throughout the State by means of a clinic held each week in one of the four areas of the State as scheduled on page 1. Each consultation service clinic is a demonstration in these techniques and is open for observation by physicians

and other professional persons working with people with seizures.

The consultation service program is based on the conviction that with the advantages of modern drugs and medical techniques, most people with epilepsy and other convulsive disorders no longer require institutional care. The consultation service clinics are designed to make available to patients, in their own communities, the most modern care and to help them to find acceptance and productive roles as part of those communities.

The consultation service acts as a screening unit to the New Jersey Neuro-Psychiatric Institute in those instances where requests are made for admission

on the basis of epilepsy.

The rehabilitation team

At the consultation service clinics, patients referred by the private or hospital clinic physician are examined by James F. Haunmill, M.D., who is also a consultant epileptologist to the New Jersey Neuro-Psychiatric Institute. Each patients social, educational and vocational problems are also studied by a social worker and others who work as a team with Dr. Hammill.

Recommendations for medication or other medical care—as well as for help in nonmedical areas—are sent by Dr. Hammill to the referring physician, who continues to treat his patient. The nonmedical rehabilitation team members are available to help find solutions to patients' difficulties in family, community, school and employment relationships.

The "contact physicians"

Assisting Dr. Hammill as "contact physicians" in the four areas of the State are the five physicians listed on page 1. The contact physicians, all of whom have had special orientation courses by Dr. Hammill, prepare patients for the service clinics and provide a local avenue of followup information for referring physicians after patients have been seen at the consultation service clinics.

The coordinated program

1. State department of institutions and agencies through its New Jersey Neuro-Psychiatric Institute.

When the former Skillman Village for Epileptics was reorganized in 1952 into the New Jersey Neuro-Psychiatric Institute, it undertook an active program of preparing and discharging to their homes, those patients capable of functioning in the community. It undertook also the task of fostering development of community resources to provide necessary care for these patients, and for the much greater number of seizure patients in New Jersey communities who have never been institutionalized and who with adequate community care, will not need institutionalization. The institute participates in the consultation service, providing the services of Dr. Hammill and the contact physicians, the social worker, stenographic help, the director and other services.

New Jersey Neuro-Psychiatric Institute, Box 1000, Princeton, N.J. Robert E.

Bennett, M.D., medical director.

2. State department of health, through its division of chronic illness control. The division of chronic illness control, as part of its program of discovery, prevention and research in long-term allments, provides each of the five hospitals listed on page 1 with an electroencephalographic machine and a trained EEG technician to assure consultation service patients access to this important diagnostic facility. The EEG machines, each located in an area having little or no similar facilities, also are available for use of other patients according to the policies of each hospital. The division also provides the consultation service with printed material and other services.

Division of Chronic Illness Control, 211 East State Street, Trenton, N.J.

Marian R. Stanford, M.D., director.

Other agencies and organizations contribute to the effectiveness of the service in many cooperative ways.

Availability of the service

The New Jersey patients in need of specialist consultation for seizure problems but financially unable to be referred to a private consultant are eligible for consultation service when referred by their clinic or private physician by use of a referral form. No treatment is given by the consultation service, whose function is only for consultation and demonstration. Preparing of case history and scheduling for the clinic may require some time following receipt of the referral form at service headquarters.

Cost

There is no cost to referring physician or to patient for the consultation service. When special diagnostic services, other than EEG are required, they are sought in the community from which the patient comes. For cases having need for services unobtainable in their own communities, the Society for the Welfare of Epileptics has made funds available to the consultation service, for use under special circumstances.

Procedure for New Jersey consultation service for convulsive disorders

- 1. Referral form sent by private or clinic physician to headquarters of consultation service, New Jersey Neuro-Psychiatric Institute, Box 1000, Princeton, N.J.
- 2. Case prepared for clinic appearance. Patient seen by contact physician and social worker to perfect referral information.
- 3. Notice of time and place of clinic appointment sent to patient, referring physician and to others indicated.
 - 4. Patient seen by Dr. Hammill and team members at clinic.
 - 5. Report and recommendations sent to referring physician.
- 6. In liaison with referring physician, team members undertake indicated referral to nonmedical services, and followup is arranged.
- 7. Contact physician available for followup consultation with referring physician.
 - 8. Patient scheduled for reappearance at clinic as indicated.

EXHIBIT No. 4

BYLAWS OF ADVISORY COUNCIL TO THE NEW JERSEY CONSULTATION SERVICE FOR Convulsive Disorders

ARTICLE I. NAME

The name of this organization shall be the Advisory Council to the New Jersey Consultation Service for Convulsive Disorders.

ARTICLE II. LOCATION

Officers of this council shall be the headquarters of the New Jersey Consultation Service for Convulsive Disorders.

ARTICLE III. PURPOSES

Purposes of this council shall be:

A. To bring together representatives of agencies and organizations, government and voluntary, concerned with New Jersey residents who suffer convulsive seizures (epilepsy) to the end that the interests and resources of these organizations and agencies may be coordinated and made more effective in serving those suffering convulsive seizures (epilepsy).

B. To serve as the general policymaking body for implementation of the epilepsy project outlined in the State plan regarding epilepsy which was formulated by the Medical Society of New Jersey and approved by its board of trustees, April 16, 1950, and which is an addenda to these bylaws.

ARTICLE IV. MEMBERSHIP

Section 1.—Membership in this council shall consist of one formally designated representative, who may have an alternate, from each of the following agencies and organizations:

Medical Society of New Jersey.

State Department of Health.

State Department of Education.

State Department of Institutions and Agencies.

State Department of Labor and Industry.

New Jersey Society for the Welfare of Epileptics.

New Jersey Neuro-Psychiatric Association. New Jersey Mental Health Association. New Jersey Industrial Medical Association.

New Jersey Chamber of Commerce.

New Jersey A. F. of L.

New Jersey CIO.

and representatives of such agencies and/or organizations and individuals as the council may from time to time invite to membership.

Section 2.—Membership in the council shall continue so long as the member is the formally designated representative or alternate of one of the organizations or agencies named in section 1 of this article, or of an agency or organization which has been invited by vote of the council to designate a member. If a member fails to attend or be represented by an alternate at three consecutive council meetings, the council may request designation of another member from the organization or agency he represents.

ARTICLE V. OFFICERS

Section 1. Number and term of office.—The officers of this council shall be a chairman and vice chairman who shall be elected from the membership to serve until the next annual meeting of the council, or until their successors have been elected. No officer shall succeed himself in office for more than two successive terms. The director of the New Jersey Consultation Service for Con-

vulsive Disorders shall serve as secretary to the council.

Section 2. Nomination and election.—The chairman shall appoint, not later than 30 days before each annual meeting, a nominating committee of three members one of whom shall be designated as chairman. Such nominating committee shall submit at the annual meeting the names of nominees for election as chairman and vice chairman of the council. Nominations also may be made from the floor at the annual meeting. An election shall be held at each annual meeting, nominees receiving the highest number of votes shall be duly elected, taking office immediately.

Section 3. Vacancies.—Vacancies among the officers arising from any cause whatsoever shall be filled by vote of the council at its next meeting. Officers so

elected to vacancies shall serve until the next annual meeting.

ARTICLE VI. DUTIES OF OFFICERS

Section 1. Chairman.—The chairman of the council shall preside at all meetings of the council, appoint and be ex officio member of all committees authorized by the council, and perform such other duties as usually pertain to such office.

Section 2. Vice chairman.—In the absence of the chairman the vice chairman shall preside at meetings of the council, and perform such other duties as the

council may designate.

ARTICLE VII. DIRECTOR

The director of the New Jersey Consultation Service for Convulsive Disorders as provided in the State plan regarding epilepsy, shall under direction of the medical director of New Jersey Neuro-Psychiatric Institute, and this council,

serve as secretary and administrative officer for the council.

The director of the New Jersey Consultation Service for Convulsive Disorders as provided in the State plan regarding epilepsy, shall be a member of the staff of New Jersey Neuro-Psychiatric Institute. The director, under supervision of the medical director of New Jersey Neuro-Psychiatric Institute shall administer the affairs of the project. The director shall attend all meetings of the council and council committees, serving as secretary and participating in the deliberations. The director may seek guidance and help pertinent to the work of the project from any member of the council at any time.

ARTICLE VIII. MEETINGS

The council shall meet at least three times annually at times which shall be established by the council at the annual meeting which shall be held in October. Special meetings shall be held upon the call of the chairman or by petition of a majority of the council members. At least 10 days' notice in writing shall be sent by the secretary to all council members for all meetings. Persons or groups of persons other than those authorized to attend by these bylaws, may attend council meetings at the invitation of the council.

ARTICLE IX. QUORUM

At any meeting of the council a majority of the members shall constitute a quorum.

ARTICLE X. AMENDMENTS

These bylaws may be amended or revised by the council at any regular or special meeting of the council, provided that the proposed amendment shall have been presented at a preceding meeting or notice of the proposed amendment shall have been sent to all members with notice of the meeting.

Note.—The bylaws were revised by the advisory council on January 16, 1958.

EXHIBIT No. 5

ADVISORY COUNCIL OF THE NEW JERSEY CONSULTATION SERVICE FOR CONVULSIVE. DISORDERS

Officers:

Mr. John W. Hayden, Esq., chairman, 407 Walker Road, West Orange, N.J. Robert E. Bennett, M.D., vice chairman, medical director, New Jersey Neuro-Psychiatric Institute, Box 1000, Princeton, N.J.

Mr. Harold G. Logan, secretary, director, New Jersey Consultation Service for Convulsive Disorders, New Jersey Neuro-Psychiatric Institute, Box 1000, Princeton, N.J.

Members:

John W. Tramburg, commissioner, Trenton, N.J.

Eugene T. Urbaniak, chief, bureau of legal affairs, Trenton, N.J.

V. Terrell Davis, M.D., director, division of mental health, Trenton, N.J. State department of health:

Marian R. Stanford, M.D., director, division of chronic illness control. 209 East State Street, Trenton, N.J.

Margaret H. Edwards, M.D., division of chronic illness control, 209 East State Street, Trenton, N.J.

Curtis E. Culp, M.D., division of constructive health, 209 East State Street, Trenton, N.J.

State department of education: Boyd E. Nelson, Ph. D., director of special education, 175 West State Street, Trenton, N.J.

Medical Society of New Jersey: Harrison F. English, M.D., 160 West State-Street, Trenton, N.J.

State department of labor and industry:

Beatrice Holderman, director, New Jersey State Rehabilitation Commission, 38 South Clinton Avenue, Trenton, N.J.

Joseph A. Jordan, superintendent, New Jersey State Employment Service, Trenton Trust Building, 28 West State Street, Trenton, N.J.

Lawrence O. Houstom, Jr., executive assistant to the commissioner, 20 West Front Street, Trenton, N.J.

New Jersey Hospital Association: Robert G. Boyd, director, Morristown Memorial Hospital, 100 Madison Avenue, Morristown, N.J.

New Jersey State Chamber of Commerce: Albert H. Acker, secretary, 54

Park Place, Newark, N.J. Industrial Medical Association of New Jersey: Thomas F. Nevins, M.D.,

Esso Standard Oil Co., Bayway Refinery, Box 222, Linden, N.J. New Jersey Association for Mental Health: Edward P. Duffy, M.D., 60 South Fullerton Avenue, Montclair, N.J.

New Jersey Neuro-Psychiatric Association: Eugene Revitch, M.D., New Jersey Diagnostic Center, Menlo Park, N.J.

Consultant:

New Jersey Consultation Service for Convulsive Disorders: James F. Hammill, M.D., 312 Briarcliff Road, West Englewood, N.J.

TEXT OF STATEMENT PRESENTED BY MR. PERCY L. CLARK, OTR, REPRESENTING THE NEW JERSEY OCCUPATIONAL THERAPY ASSOCIATION

Mr. Chairman and members of the committee, I am representing the New Jersey Occupational Therapy Association to speak in favor of the proposed independent living bill, H.R. 3465, as it relates to rehabilitation both in the fields of the physically handicapped and psychiatry.

The following are the urgent needs as we have experienced and recognized them as occupational therapists preparing patients to become more independent, responsible members of society.

(A) More sheltered workshops are needed: A job-placement service should be an integral part of the program to help shorten the time spent in the work-

 One of the most urgent needs is that sheltered workshops accept the psychiatric patients who still require some supportive situation during the initial adjustment period in the community, and at the same time give him an opportunity to contribute to his own support.

2. We also must meet the need of those who cannot fit into competitive industry, such as those with progressive conditions who are not eligible under the present legislation, also those with multiple handicaps but who can attain some measure of self-support.

(B) More adequate professional services for the homebound who, with maintenance therapy administered in the home, could be productive in homebound

employment of a limited nature.

(C) Halfway house type of facilities are needed for individuals without home or family, who could be discharged from a hospital, either with a residual physical handicap or on a convalescent status from a mental hospital, into a protective independent living situation.

Examples: The loneliness of feeling rejected by society, such as the psychiatric patient and the alcoholic; self-care problems of the physically handicapped re-

quiring some assistance.

The required resident personnel would not need to be highly trained, thus not making it necessary to draw professionally trained personnel from more vital rehabilitation facilities.

(D) More generous provision for prosthetic devices, orthopedic equipment should be made for the needy individual to promote a greater degree of inde-

pendent living.

(E) More adequate vocational counseling, evaluation, planning, and training services are needed for convalescing patients who are not presently eligible, especially in the psychiatric area which at present is inadequate.

(F) Counseling services must be extended to include families of the handicapped in cases where disability of the breadwinner necessitates a former de-

pendent's assuming this role.

Counseling to help the family accept this shift in roles.

2. Vocational counseling and/or training for the new breadwinner may be needed.

(G) Greater numbers of professionally trained personnel are needed. This is the most serious, basic deficiency in meeting the needs of the rehabilitation

program.

In occupational therapy alone there are job opportunities for 14,000 therapists in addition to the present 6,106 registered therapists. Also, enrollment in occupational therapy schools have decreased, due to high tuitions, which may mean that some of the schools will not be able to continue the curriculums.

1. Financial assistance is needed for extensive recruitment and publicity

programs.

2. Financial assistance (tuition and living) should be made available for potential students as part of the recruitment program. 3. Scholarships for graduate work for registered occupational therapists would

improve the quality of professional services. 4. Higher salaries are required to attract and keep greater numbers of

personnel.

Mr. Elliott. Our next witness is Mrs. Herbert Carson, president, National Organization for Mentally III Children, Philadelphia, Pa. In the absence of Mrs. Carson, I shall next call Roger Davis,

executive director of Goodwill Industries.

Is Mr. Robert F. Irwin, Jr., present?

Rev. Francis LeBlanco?

Dr. Ruth G. Arnold?

STATEMENT OF DR. RUTH G. ARNOLD, PROFESSOR OF SPEECH AND ENGLISH, JERSEY CITY STATE COLLEGE, NEW JERSEY

Dr. Arnold. Mr. Chairman, may I stand, please.

Mr. Elliott. For the record, Dr. Arnold, would you care to state

on whose behalf you are appearing today?

Dr. Arnold. Yes. I have a prepared statement which I would like to leave with you and highlight it with some remarks at this point. I am presently assistant professor of speech and English at New Jersey State College, president of the State speech association, and have been a supervisor of speech for metropolitan public school system.

I think that in the presence of Dr. Kessler before we were all quite impressed with the very definite need that faces all of us in the field of training people for dealing with the handicapped and it is wonderful to be in the room in which that spirit still prevails.

Is it not strange that in a 20th century kind of civilization where we have choices about the kinds of cigarettes we buy, the automobiles that we buy, the perfume that we buy, et cetera, in a very material way and we have many, many choices, we do look for what a dollar

can buy.

In the field of the education for the handicapped we do not really get our dollar's worth because we do not have any choices to make. In hiring candidates for the training of the handicapped, as I have had the opportunity of doing, it has been most difficult for me to hire or to find the person best qualified for the job that was available.

I think it has been established throughout yesterday's hearing and today that we do need additional personnel. Where do we get them from? Do we get them from the colleges and universities of the country? It would seem that that is probably the logical place. As Dr. School of Montclair has indicated, and others from other State teachers' colleges, we do not have the facilities or the finances to establish training programs.

Now, let me highlight from a rather personal point of view three findings which are included in my report. First of all, I had a part in conducting a statewide survey on the speech education needs of the State of New York in 1957. Some major findings there were that approximately 10,658 students were receiving some kind of speech

therapy, some kind of speech correction.

These 10,658 students were being assisted by approximately 67 correctionists. With a little bit of mathematics and understanding that the national recommendation is 1 correctionist for at least 75 boys and girls, this would seem that in 1957 in an eastern seaboard State in the United States, one correctionist was working with approximately 159 students or, let us say, in round figures, twice the

number that he actually should be working with.

Another finding of the survey was that of the 21 counties in New York note more than half had some kind of speech program. Now I sould like to emphasize "some kind" because people still—and may I once again refer to Dr. Kessler—are still medieval in their thinking. They do not understand what we mean by educational speech correction. A speech to many laymen, to administrators, to teachers, means elocution, declaiming, public speech. It means, "Well, maybe we should have a speech program only if we have the money."

"Speech is a fad and a thrill. After all, you don't have too many handicapped people to worry about. Why get excited about this?" So there is a great deal of difficulty in conducting the survey throughout the State to get people to understand exactly what we were trying to discover, how many speech-handicapped people there were and what kind of training they were getting by how many people

what kind of training they were getting by how many people.
So of the 21 counties in New York only approximately 11 had some kind of program. If you do not wish to ask me other questions about

the survey I would like to move along.

In this metropolitan area of Jersey City let us try to get a geographical view of the surrounding community of approximately West New York, North Bergen, Weehawken, North Hoboken, Union City, Bayonne, that out of these surrounding communities there is only one community in this metropolitan area, just across the river from New York City, that has any kind of ongoing speech program. In other words, this means a truly identifiable speech program for those who are handicapped, for those who are gifted, and for the normal child.

Now this seems to me to be a very important finding for all of us

to keep in our thinking at the moment.

Mr. Daniels. Where is that located?

Dr. Arnold. This community is Union City. The supervisor of speech for that community is in the audience this morning. This figure does not mean, or this picture does not mean that there are not children in the other communities who do not have problems; this is not so. Of course, they have problems. Where do these students go? Where do these frustrated parents go? Either to private people who are not particularly qualified or who have not the certification that a SHA testifies that a speech pathologist should have. So usually they do go to the National Hospital for Speech Disorders which is in New York City.

Thirdly, in my work at Jersey City State College I am only one person who is operating in a so-called speech clinic where all of the people who come to me, all of the telephone calls that come to my desk daily, I unfortunately must say, "I am sorry I cannot help you, we do not have the personnel, we do not have the facilities." Possibly with House Resolution 494 the time will come when my telephone an

swers will not have to be so abrupt.

In addition, at Jersey City we have very little inservice training for classroom teachers to assist in a stopgap kind of measure to help train those youngsters we may find in the regular classroom who have

speech and hearing disorders.

Much can be done in an inservice way in this fashion to assist the classroom teacher but only sporadic attempts are being done at the moment. Again, at Jersey City, and this, of course, is very upsetting to me, it seems that we are accepting candidates for training in our teachers colleges who themselves have speech problems, who in no conscionable understanding should be placed in, let us say, an elementary school classroom if they themselves have speech problems.

Because we do not have the personnel we cannot do much with these candidates for teacher training. Finally, just to add a note to what has been said yesterday in regard to the special education program at Jersey City State in conjunction with the A. Harry Moore School, this is a splendid program, there is no doubt about it, but it cer-

tainly has not yet got off the ground.

There are no finances available for this, there are only two courses in the curriculum that are available now for young people interested in the field of special education to take at Jersey City. So the picture does seem rather black, does it not, when one verbalizes these things and in addition when one hears parents come to the clinic and say: "Well, don't bother about my boy, the doctor says he will grow out of this problem; he does not have a speech problem," again medieval thinking; this is not necessarily so.

My next question is, "Well, while we are waiting for him to grow out of the problem, how many other problems are going to arise?" Or the parent who comes in and says, "Well, my child has a cleft palate but that is the way the Lord made her and I am not going to do anything about it." So a great deal has to be done.

I heartily endorse your recommendation, members of the committee, and I should like to thank you very much for inviting me here. May I say that the first bit of homework assignment for some of the first recipients of your grants in aid to the various State pathologists be that they read the proceedings of this committee's hearings.

Mr. Elliott. Thank you, Dr. Arnold for coming here today. Without objection, the written statement of Dr. Arnold will be filed for the

record immediately following her oral testimony.

(The statement referred to follows:)

STATEMENT BY DR. RUTH G. ARNOLD, PROFESSOR, SPEECH AND ENGLISH, JERSEY CITY STATE COLLEGE, JERSEY CITY, N.J.

I should like to compliment the committee on its regional approach in assaying the needs for special education and the training of speech pathologists and audiologists in the United States.

Having been a supervisor of speech for a metropolitan public school system, and at present serving as assistant professor of speech and English at Jersey City State College, Jersey City, N.J., and president of the Speech Association of New Jersey, I should like to present some of my thoughts for your considera-

First, it needs to be said that in the past many competent and dedicated men and women have worked in the field of speech rehabilitation—progress has been made, research has been accomplished, school systems are incorporating services for the speech and hearing handicapped—but the need still remains for more expertly trained speech pathologists-

To serve in more schools throughout the State;

To aid the growing numbers of boys and girls who have serious speech

and hearing problems.

It is my contention, strongly felt on the basis of years of experience in school systems, in hospitals, and in private practice that, when more people know how to handle problems in both the fields of special education and the speech handicapped, the situation is likely to be helped because more parents, teachers, specialists in allied fields, and laymen will throw off their bonds of medieval thinking about the handicapped.

More damage is done to the child handicapped in any special way by wellintentioned meddling and by ignorance of the problem than by sheer neglect of

the child with a crippling condition.

Daily I meet parents in the speech clinic at the college who say-

"My doctor says Johnny will grow out of his speech, hearing, or other

"If the Lord gave Mary a cleft palate, she's got to bear it—we won't do anything about it."

'My child can't be mentally retarded—he just has something wrong with his

"My boy just talks too fast: nothing's wrong with him that a good whack won't cure" (when in this case, the child is a severe stutterer).

"Oh, he don't talk because he was frightened by an animal; his tongue is stuck."

One would think these attitudes were those expressed by individuals not living in a communication oriented 20th century community. However, antiquated superstitions persist. Education and trained specialists are needed to get at the basic problems and to dispel the homespun diagnoses.

Let us survey the offerings in speech education in this local metropolitan area: Let us consider Jersey City of a focal point in the surrounding communities of: North Bergen, West New York, Weehawken, Union City, Hoboken,

Guttenberg, and Secaucus.

Only one community, Union City, has an organized, ongoing, complete program of speech education offering speech correction, speech improvement, and speech arts. This does not signify that there aren't children with speech and hearing problems in the other communities. There are. It simply means that few funds are available for such special services and that too few members of boards of education and educators themselves have accepted the challenge in their midst.

Eventually in these communities parents of children having persistent problems have to be referred to or they go voluntarily to the National Hospital for Speech

Disorders in New York City.

In fact, because I am working alone at Jersey City State College, I too have

to make referrals to the National Hospital.

Respectfully, I should like to present one of the findings of the statewide survey of speech education which I conducted in 1957. It was printed in the Speech Teacher, a publication of the Speech Association of America. In 1957 it was found that approximately 10.658 children in the public schools of New Jersey were receiving some kind of speech therapy from 67 correctionists.

In other words on the average each correctionist was working with 159 children—a phenomenal figure in the light of its frustrating implications. The professionally recommended caseload for each correctionist is no more than 75 students. So in 1957 in the schools of an eastern seaboard State of the United States more than twice the suggested number of boys and girls needing speech and hearing therapy were handled by one correctionist.

My plea again is for more skillfully trained correctionists to serve in more schools throughout the State to aid the growing numbers of boys and girls who

have speech or other special problems.

Further to sketch the existent problem—with which I am constantly faced at

Jersey City State College, it can be stated that:

1. There is comparatively little service available for the speech handicapped individuals living in this city.

Only sporadic attempts are made at the State college to train classroom teachers to deal with children handicapped in speech in the regular classroom.

3. There is little service available for those Jersey City State College students, training to become teachers, who have speech problems themselves to get the help they need. Shall we compound the felony, as it were, by permitting a teacher handicapped in speech to serve as the speech model for a class, especially on the elementary school level?

Though our six State colleges are to varying degrees preparing speech correctionists and special education teachers, the number of qualified personnel being trained are not sufficient for the needs at present. Though we've come a long way since the practices of incarcerating the mentally deficient in the attic, or cutting off portions of the tongue to alleviate stuttering, nevertheless, the handicapped in many places still suffer from lack of therapy and from the ridicule of family, friends, and society.

It is time that we worked with all those who are handicapped on a more complete basis. That is, speech therapy, physical rehabilitation, public or private schooling, emotional rehabilitation, occupational guidance, all disciplines should

proceed in unison in terms of the needs of the individual.

When the specialist in each of these disciplines is working alone, he, in large measure, defeats his own purposes. Since the human body is such an intricate interrelated organism, handicaps in any one or more of its parts affect most assuredly other of its parts. In many cases, for example, a child's speech defect is symptomatic of other ills: emotional, mental, phychological, or physical. Merely correcting or alleviating the speech defect is a temporary measure. The cause of the speech problem needs to be discovered and eliminated (if possible) first.

Such a total approach in working with the speech handicapped, can best be achieved by recruiting the best qualified candidates from undergraduate college and university levels and by training them in terms of professional graduate courses. A plea is entered at this point for upgrading the basic standards of speech pathologists; that membership in ASHA be mandatory; that before one is permitted to specialize in speech pathology that he successfully complete at least a year of regular classroom teaching.

It is therefore urged that House Joint Resolution 494 be passed to provide for more expertly trained speech pathologists and audiologists—

To serve in more schools throughout this State and the country:

To aid the 8 million Americans handicapped in speech and hearing.

SPEECH EDUCATION IN NEW JERSEY: A STATEWIDE SURVEY

(By Arthur A. Eisenstadt and Ruth G. Arnold 1)

A survey of the speech offerings in the public schools of New Jersey has long been needed to discover the present scope of speech education in the State and the trends of its growth. Such a survey would identify those areas already having successful speech programs and serve to encourage administrators, members of boards of education, teachers, and leaders in other communities (both within and outside the State) to plan for the development of speech programs in their respective school systems. For these reasons we undertook the survey we describe below.

To each of the 21 county superintendents of schools we sent an explanatory letter and a questionnaire. We asked each superintendent to supply as much information as he could concerning the existence and extent of the speech program in his county. In the questionnaire we suggested that if in each of the cities or townships there were some key persons who could give us more detailed information that the superintendent supply us with the name and address of

the teacher or administrator who could best answer the questionnaire.

Each of the 21 recipients returned the questionnaire he had received, either having answered it or indicating the person who might be better able to supply

the data we had requested.

The county superintendents suggested a total of 45 names to us. These individuals were mostly residents of the larger metropolitan areas of the State, in Essex, Hudson, Passaic, Union, and Bergen Counties. We sent a more detailed questionnaire to these 45 teachers and administrators, requesting information in five different and distinct areas. From these 45 questionnaires we learned the names of 19 key people throughout the State who had direct experience with the speech programs in their schools. To these 19 we sent a letter concerning the purpose and nature of the survey and the detailed questionnaire.

From 16 of these 19 people we received replies to our requests for data. base our findings on these 16 answers to the detailed questionnaire. In all, we queried 88 individuals throughout the State, not once, but several times, during

the survey in order to verify the data we collected.

All of the 21 counties of New Jersey, from Atlantic to Warren, were included in the survey. To date, in 11 of the 21 counties there is no established program in speech. However, superintendents in several of these counties expressed the hope that in the near future there might be some consideration of the speech needs of students in their localities.

According to the reports we received, the greatest concentration of work in speech and the largest number of teachers of speech are in the metropolitan Essex County has 20 full-time teachers; Hudson County has 16 full-time teachers and 1 part-time teacher; Passaic County has 13 full-time teachers; Union County has 10 full-time teachers and 1 part-time teacher; Bergen County has 8 full-time teachers of speech.

Approximately 10.658 children are receiving speech therapy, under 67 2 correctionists. The correctionists see pupils once a week, on the average; from only one school did we receive a report of a therapist's meeting with pupils twice a

week.

¹Readers of the Speech Teacher are familiar with the name of the senior author of this report because of earlier publications in the Speech Teacher. His "As Others See Us" appeared in the issue for Marcu 1952: "Speech Education Survey of New Jersey Junior Colleges," in November 1953: and "The Speech in the New Jersey School Program," in November 1953: Dr. Eisenstodt is of Speech in the New Jersey School Program," in November 1953: Dr. Eisenstodt Dr. Eisenstodt College at Jersey 1954: All the Department of Special Education, Newark Board of Education, and Twersity College, Rutgers University. He also has a private speech practice in Montclair.

The junior author has not previously written for the Speech Teacher. Currently an assistant professor of speech at the State Teachers College at Jersey City, at the time of making the survey Mrs. Arnold was supervisor of speech for the Union City [New Jersey] public schools. She received her B.A. degree from the New Jersey State Teachers College at Montclair and her A.M. and Ed. D. degrees from Teachers College, Columbia University, in 1940, 1945, and 1954, respectively.

*This number does not include those correctionists working with private agencies who also serve the schools in their areas. In at least six areas of the State there are tentative plans for the employment of additional correctionists in the near future.

The number of children participating in speech improvement *programs ranges from approximately 1 percent of the school population to 20 percent; in some instances it is as high as 100 percent. Those schools that do include speech improvement in their speech programs do so according to a variety of plans. In 11 systems the speech improvement program is in the high school; 8 school systems present speech improvement in the elementary school; in 7 systems it is part of the English program throughout the schools; in 8, speech improvement is a separate course; in 6 it is elective, and in 3, required. However, because of semantic confusion among some of the respondents concerning "speech," "English work," "communication," "oral English," and similar terms, we could not ascertain the total number of English and other classroom teachers engaged in teaching various speech skills. The teachers of speech improvement per se total 25.

There was no clear indication of the number of children participating in classes in speech arts. In general, where speech is available in a school, the traditional emphasis is on dramatic arts. In general, activities in the speech arts are available to the gifted few; no respondent reported a school system in which speech arts are accessible to all students. According to this survey, 86 teachers of

speech arts are employed in the State.

So far as we can determine, there are approximately 561 students with hearing handicaps. We do not present this figure as an exact finding, however; it is merely a byproduct of the survey as those who may have been in a position

to present valid information relayed it to us.

The oldest known program in the State that this survey revealed is Jersey City's, established in 1918. In the 1930's there was a noticeable surge of new programs. In the 1950's there was another period of increase in the number of speech programs. The greatest amount of activity at present seems to be in the field of speech correction. Speech arts, in most instances as elective courses, receive the next greatest amount of emphasis, with least emphasis on speech improvement. There were reports from only two schools of significant growth in each of the three areas of speech correction, speech improvement, and speech arts.

The replies from the 16 areas throughout the State indicate that in 11 school systems there is a provision for screening all pupils to dicover speech problems. In four systems there is no overall screening. (One respondent did not reply to this question. In seven school systems the correctionist in charge conducts the screening. Four systems utilize referrals. In one school tape recordings are made of all the pupils' voices. In most of the systems the tape recorder and the pure-tone audiometer are regarded as indispensable tools for diagnosis

and therapy.

As one of us has reported elsewhere, the team concept is growing in the New Jersey school systems. Specialists in various areas pertinent to the growing child and his problems are appearing in the schools in greater numbers and with increasing frequency. For instance, there are not only school nurses, but also school physicians in all the 16 systems represented in this survey. All but one of the systems employ a school psychologist, and in 12 there is a school dentist. It is perhaps indicative of the direction of the growth of special services that school psychologists outnumber school dentists. Five systems have added social workers to their staff. This addition of special personnel suggests the administrative view that truancy and behavior problems may be due to the pupils' homes and social backgrounds—a view which teachers of speech have long utilized in their therapeutic programs. Other additions to the special services (and "special" is fast becoming inaccurate and obsolete in this context) are those of otologists. At present four school communities utilize otologists to facilitate the diagnosis and proper placement of pupils with hearing losses and allied speech disorders. This varied array of specialists suggests that speech education in New Jersey is based on the "whole child" concept.

³ By "speech improvement" we mean basic instruction in the fundamentals of speech: voice, diction, simple public speaking, listening, conversation, telephoning, and interviewing.

Arthur A. Eisenstadt, "Selected New Jersey Sources of Interest to the Speech Correctionist" (Newark: Division of Special Education, 1956).

The respondents report 12 different textbooks 5 in use in the 16 school systems. These books represent two clearly discernible areas of emphasis, one on speech improvement, the other on speech arts. The two emphases seem to be approximately equal. In Newark schools there are two separate speech textbooks, one for speech correction, the other for speech skills in social situations. This wide range of textbooks is further evidence of the divergence in the philosophical approach to speech education, in the proportional stress on various facets of speech training, and, ultimately, in the very goals and purposes of the speech programs in the schools of New Jersey. It was to this last factor that we next directed our attention.

According to the respondents, in 11 school systems the primary goal of the speech program is speech correction for handicapped pupils, with speech improvement for all pupils as a major goal. In four systems training in the speech arts is the present goal, with the implication that there will eventually be an increase in the amount of training in the speech arts. Two respondents reported that developing the pupils' poise and confidence is the goal of the speech programs in their schools. Another pair stated the aim of their programs was to provide the students with an understanding of speech planning and organization. The following statements are revealing:

"To help the child to express his own thoughts, needs, and desires * * * with

distinction [sic] and clarity.

"The correct production and natural presentation of sounds, words, and ideas.

"Speech correction and speech improvement for all who need it.

"Better communication skills and greater personal enrichment for all the

pupils we can reach."

It is quite understandable and inevitable that quite different methods should develop in different communities. Both the varying needs of the school populations of widely sepaarted areas and the differing backgrounds and ideologies of the teachers insure a disparity of approaches. In many respects it is fitting and proper that there should be variation and adaptation to local conditions. Further, such wide divergence among these communities, particularly those which are ethnically, pedagogically, and socioeconomically substantially different. bespeaks both independence and flexibility. Nevertheless, so much difference, especially when it extends to the virtual exclusion or omission of certain goals and areas of speech education leads one to wonder if a more inclusive and widely consistent pattern of speech education (perhaps with the common core curriculum philosophy as its foundation) might not lead to a more nearly uniform and effective teaching program.

On the basis of the data the questionnaire elicited, certain directional patterns of growth seem to be identifiable, and it is possible to make several apparently tenable observations. First, instruction in speech (in the specialized teacher sense of the term) is assuming substantial proportions in New Jersey. are apparently four major divisions of this instruction: speech correction, speech Improvement, communication skills (public speaking, group discussion, and debate), and speech arts (e.g., oral interpretation, dramatics, and choral speaking). Within these divisions, speech education in New Jersey, which began on an organized systemwide basis as long ago as 1918, is expanding rapidly. In the last decade the number of communities engaging speech specialists has almost

⁶ Alphabetically by author(s) they are as follows: Louise Abney and Dorothy Miniace, "This Way to Better Speech" (Yonkers, New York: World Book Co., 1940). Alice Evelyn Craig, "The Speech Arts: A Textbook of Oral English" (second rev. ed.; New York: the Macmillan Co., 1941). E. F. Elson and Alberta Peck, "The Art of Speaking" (Boston: Ginn & Co., 1952). Francis J. Grifith, Catherine Nelson, and Edward Stasheff, "Your Speech" (New York: Harcourt, Brace & Co., 1955). J. Hilpelmott Co., 1955). J. B. Lipplnoctt Co., 1955). Grace A. McCullough, "Work and Practice Book for Speech Improvement" (Boston: Expression Co., 1940).

J. B. Dippincott Co., 1955).

Grace A. McCullough, "Work and Practice Book for Speech Improvement" (Boston: Expression Co., 1940).

Lettita Raubicheck, "Speech Improvement" (New York: Prentice-Hall, Inc., 1952).

Lew Sarett, William Trufant Foster, and James H. McBurney, "Speech: A High School Course" (Boston: Houghton Miffin Co., 1943).

Lucille D. Schoolfield, "Better Speech and Better Reading: A Practice Book" (Boston: Expression Co., 1937). Louise Binder Scott and J. J. Thompson, "Speech Ways" (St. Louis: Webster Publish-

Ing Co., 1955).

"Talking Time" (St. Louis: Webster Publishing Co., 1951).

Clara B. Stoddard, "Sounds for Little Folks" (Boston: Expression Co., 1940).

doubled, and there are many indications that more communities throughout the State are planning to develop either new or more extensive speech programs.

Further, there is a change in the emphasis on various phases of speech education. Traditionally, the speech arts, particularly dramatics and declamation, have received the greatest amount of attention. While class plays and the oral reading of poetry continue to play a justly important part in activities for creative expression, the trend seems to be toward a constantly growing emphasis on speech correction. Although respondents reported little increase in instruction in speech improvement, some of them expressed the opinion that there is a definite need for such an increase. Where radio speaking, debate, discussion, dramatics, or participation in assembly programs are available to pupils, they are typically part of the English program, or are extracurricular activities.

The concept of speech education is evolving. Opinions concerning the extent to which entire classes, rather than selected individuals, shall receive speech instruction are changing, involving the issue of classroom versus clinic training. The use of a literary or general diction approach in contrast to dealing with a single sound or specific speech defect per se is undergoing scrutiny and reevaluation. Attitudes toward specialty training and teacher background are also changing. Apparently there is an increasing number of specialists whose education includes a broad coverage of the total speech spectrum: Arts, science, crafts, and related subjects. This circumstance suggests that it will become possible to employ the services of specialists whose training in and perspective of other areas are sufficiently broad for them to aid in the integrative goals of general education.

In summary, then, the speech program in New Jersey is vigorous, and is making rapid strides forward. Its overall speech picture compares quite favorably with those of other States, and is definitely improving. We have by no means reached the point which we can and should attain, and, woefully, many communities are as yet entirely without a speech program. But we can justifiably

point to our professional growth with pride and gratification.

EXCURSUS

"Rule.—Before attempting to read a lesson, the learner should make himself fully acquainted with the subject, as treated of in that lesson, and endeavor to

make his own the feelings and sentiments of the writer.

"For this purpose, every lesson should be well studied beforehand, and no scholar should be permitted to attempt to read any thing, which he cannot easily understand. When he has thus identified himself with the author, he has the substance of all rules in his own breast. It is by going to nature that we find rules. The child or the savage orator, never mistakes in inflection, or emphasis, or modulation. The best speakers and readers are those who follow the impulse of nature as felt in their own hearts, or most closely imitate it as observed in others. As the first and most important step, then, let the reader or speaker enter deeply into the feelings and sentiments, which he is about to express in the language of another. This direction is placed at the threshold of this subject, because the prevailing fault in reading is listlessness and dullness, and the principal cause of this fault, is want of interest in the subject which is or ought to be before, the mind."—William II. McGuffey, "McGuffey's Newly Revised Eclectic Fourth Reader: Containing Elegant Extracts in Prose and Poetry, With Rules for Reading, and Exercises in Articulation, Defining, etc." (Cincinnati: Winthrop B. Smith & Co., 1853), pages 7-8.

Mr. Daniels. When was this study completed that you spoke about?

Dr. Arnold. 1957 and 1958.

Mr. Daniels. This was given to the State Legislature of New Jersey, and you have appeared before them?

Dr. Arnold. The department of education, not the legislature.

Mr. Daniels. Not the legislature?

Dr. Arnold. No.

Mr. Daniels. Has any bill been introduced in the legislature to bring more aid?

Dr. Arnold, No.

Mr. Daniel. Thank you very much, Dr. Arnold.

Dr. Arnold. You are welcome.

Mr. Daniels. Our next witness will be Dr. Maurice C. Kott, acting director, division of mental retardation, Department of Institutions and Agencies of Trenton, N.J.

Dr. Korr. I have a written statement which I will file with your clerk. I think if I ad lib from it, or read from it, I can bring it

within a few minutes.

Mr. Daniels. You have 10 minutes.

Dr. Kott. I will make it, sir.

STATEMENT OF DR. MAURICE G. KOTT, ACTING DIRECTOR, DIVISION OF MENTAL RETARDATION, NEW JERSEY DEPARTMENT OF INSTITUTIONS AND AGENCIES

Dr. Korr. I am grateful for this opportunity to appear before the committee.

The areas of your concern are vital to all citizens and action by the Congress of the United States of direct import to the programs for retarded and other handicapped persons in the State of New Jersey.

In this statement I wish to make reference to two problems, both the concern of this subcommittee. The first problem involves unmet needs in programs of special education; the second problem involves rehabilitation services to handicapped individuals with the possibility that as a result there can be dispensed with the need for expensive institutional care.

This committee undoubtedly has heard much testimony on urgent needs in special education. Representatives of the New Jersey State Department of Education have offered you facts on the extent to which

comparatively new programs in the State are effective.

As in all areas of governmental operations, the enactment of a statute providing types of special education does not guarantee a supply of personnel to implement the purposes or to execute the intent of the statute.

Experience in New Jersey since 1954 has disclosed a shortage of qualified personnel to teach handicapped children; even more critical is a shortage of supervisory, administrative, and research personnel to establish goals and methods of attaining objectives and to insure steady progress toward such established goals or objectives.

These New Jersey experiences of lack of personnel are not unique.

They are replicated throughout the country.

That needs for teachers and supervisory personnel have persisted for many years may be somewhat surprising in view of the many attempts to attract qualified personnel to the field.

The Federal Government has enacted statutes to aid the education of blind and other kinds of the handicapped. Federal funds have been available for scholarships and for research in appropriate areas.

This committee is presently considering a resolution to help make scholarships available for training of specialists to assist children with speech and hearing impediments.

There has also been alteration in social values relating to this kind

of work.

The influence of organizations like the National Association for Retarded Children and the National Organization for Mentally Ill Children has been great. Work with persons that are the immediate concern of such associations is considered significant, appropriate, and sometimes even noble.

Yet shiny novel programs, Federal aid, and new social values have failed to attract sufficient personnel to meet the educational needs of

the handicapped.

Of significance in the matter of shortage of qualified personnel in the area of special education is the persistent shortage of teachers in all kinds of educational programs. School systems have difficulty in recruiting qualified personnel and are forced to employ comparatively large numbers of teachers with less than standard certification.

This problem has persisted despite some expansion of college size, increased recruitment activities, and extension and inservice programs

to upgrade teachers with substandard certificates.

Even marked salary increase and greater fringe benefits have been of little avail in attracting great numbers of persons to this field.

It should be noted that this situation is not unique to education. Manpower trends in the mental-health professions show tendencies

to short supply in the face of increasing demand.

A congressional inquiry on mental illness in 1953 saw a need for twice as many psychiatrists as were then available. It is estimated that there is a national gain of but 450 psychiatrists a year and that it will be 20 years before there will be double the 1953 number in the country.

Of course, as our population grows in the next 20 years, the need will grow, too. We will remain short of this class of professional.

Further, medical schools have been faced with a low-tide manpower pool. In recent years such schools have accepted a higher and higher proportion of applicants.

In 1948-49 the ratio of applicants to admissions was 3.6 to 1.

By 1953-54 it dropped to 1.97 to 1, and by 1954-55 to 1.87 to 1. In psychology, the output of universities has remained somewhat more static than the demand.

Moreover, in the presence of a drop in number of bachelor degrees in psychology in recent years, the number of graduate-school enroll-

ments for training in psychology will also drop.

As far as social work is concerned, there are signs of a growing shortage in this field. There is some evidence that some schools are operating below capacity and that a high proportion of members of the profession leave the field, for instance, to become homemakers.

Extension or inservice programs do little to meet demand since most persons taking such courses are already in the field of social work.

This pessimistic yet realistic recital of the general shortage of workers in the areas of education and mental health suggests that no limited or simple approach will provide a solution to this problem in special education. Some massive effort must be undertaken to assure educational opportunities and training to all who are intellectually qualified.

A large percentage of students capable of work in these areas drop out before completing high school. Of those who complete high school, many do not undertake collegiate training and some who begin college do not finish.

There is evidence available that of the upper 20 percent—in terms

of intelligence—only one-third finish college.

The current financial attractions of industry and commerce dilute

the pool of college aspirants.

The rumors of difficulty in admission in the face of a closing door to college may dissuade some potential students. And the general American attitude about the collegiate-trained egghead who is impractical in dealing with realistic and financial matters, may have a large influence on all who might be capable of collegiate training.

What seems to be called for is an extended effort to make the professions as financially attractive as other forms of adult work, so that all who may be intellectually capable desire to go on to college. This making attractive may have to include not only scholarships but forms of subsidization during those years that the college student is precluded from earning the equivalent of that earned by the high school student who does not go to college.

Of course, some national action is required to make certain that colleges and universities do have space for an expanded student body. Federal support is necessary to expand college size and to expand faculty so that the quality of instruction or training remain high.

The second problem to which I desire to address myself is engendered by the aspirations for the independent living bill—H.R. 3465. This bill makes certain assumptions which are open to question.

Two seem worthy of comment. The assumption that it is generally desirable to "dispense with expensive institutional care" and the assumption that the skills of a rehabilitation counselor, as we now know of the training and achievements of such persons, are sufficient to accomplish the objective sought by this bill.

Dispensation with institutional care—without regard to the matter

of expense—is an aspiration to be considered with caution.

While in the past there was overemphasis of the value of rehabilitation services, at present the institution has been placed in balance with other rehabilitative forces.

In many States its use is reserved for those cases which cannot be handled in the community. Institutions for the retarded, for instance, have noted a change in type and age of persons committed.

The mildly retarded, educable adolescent, or young adult, has become less evident in their populations. Received in institutions, presently, are those who are antisocial, who are dependent or neglected children, without homes, or who are so severely handicapped that they cannot be given care in their own homes, or cannot be given the care they require without severely disorganizing family life.

The institution provides for these a balance of a growth promoting and custodial arrangements not readily conceived as possible in an

independent living situation.

For any handicapped person, a good institution provides an opportunity for development in a protective environment and for opportunities of social and vocational failure without the adverse effects which frequently attend failure in the community.

To dispose of values of institutional care because of expense may be a reenforcement of financial rather than human values, a general

trend that may do the handicapped much disadvantage.

To be sure, institution residence may develop other kinds of disadvantages for the handicapped. The way to deal with this, however, is to correct whatever faults there may be in institutions and not dispense with the advantages inherent in institutional programs.

Even should one wish to beg the question of the comparative advantages to be derived in independent living, over institution care, supervision and services in this proposed program is in the traditional competence of the social worker rather than the rehabilita-

tion counselor.

Indeed, institutional social workers do provide, where they are

available, such services in pre- and post-institutional programs.

Further, it is noted that in H.R. 3465, there is provided for "cooperation" between the State rehabilitation agency and the State and local agencies administering various public assistance, insurance, and public health services. If expansion of the social-work services of these agencies is desired, why not provide for Federal assistance directly to these agencies for expanded case work programs rather than depend upon the development of a new tradition and new service and upon cooperation with other State and local agencies.

One last point: if the argument about low-tide manpower pools is cogent, from where are the personnel for this new service to come? If they are to be rehabilitation counselors, they may be taken from the thin ranks of potential teachers or other needed personnel.

If they are to be social workers, what is to happen to the present, desirable welfare programs suffering from a short supply of trained

workers.

Even in regard to the independent living bill, some direct extensive effort at extending educational opportunities by scholarships and subsidization is necessary.

Again I would like to express my appreciation for the opportunity to appear here and to announce that I shall be happy to try to answer

what questions you may have, sir.

Mr. Daniels. Are there any questions, Mr. Chairman?

Mr. Elliott. No.

Mr. Daniels. Thank you, Dr. Kott, for your testimony this morn-It will be of great help to this committee.

Dr. Kott. Thank you, sir.

Mr. Daniels. Dr. Anthony B. Suraci.

You are the head of the department of education for teaching handicapped, Seton Hall University?

Dr. Suraci. That is correct.

Mr. Daniels. Mr. Suraci, I shall limit you, as I have all the other

witnesses, to 10 minutes.

If you have a written statement, I might suggest to you that you summarize your views and your written statement will follow your oral testimony in the record, or you may read directly from the statement.

However, the time limitation will be imposed because of the large number of witnesses who desire to testify.

48157--60--pt. 4---

STATEMENT OF DR. ANTHONY B. SURACI, HEAD, DEPARTMENT OF EDUCATION FOR TEACHING THE HANDICAPPED, SETON HALL UNIVERSITY, SOUTH ORANGE, N.J.

Dr. Suraci. I do not have a written statement, Mr. Daniels. I

just have a few notes available for presentation.

I would like to express my appreciation to Mr. Elliott and the other Members of the House of Representatives for providing me with the opportunity to present my views as I see them in regard to the needs of special education.

We feel that if the needs of special education are to be met adequately, that Federal moneys should be made available to both State, local organizations, communities, private institutions, and so on.

In order to save some of the following needs:

The first one of primary importance as we see it is the need of extending aid to the smaller colleges and universities in order to pro-

mote their programs of special education.

To do this it is necessary to improve library facilities, more instructional equipments, and materials; to extend the programs, that is, the actual courses offered; to extend educational and medical research, to initiate and/or to expand fellowship programs and scholarship programs, and, finally, to extend clinical programs.

Seton Hall has offered a program in special education since 1954. Since that time a number of graduate students have been matriculated and are now teaching in special education in the State of New Jersey.

We have approximately 150 students at this time who are either working for State certification to teach the handicapped, or are matriculating for a master's degree in education with specialization to teach the handicapped.

Seton Hall is unique in that it is the only university in New Jersey

which has, as part of its faculty, a medical school.

In addition a working relationship has been established this year with a number of public and private agencies throughout the State, centers such as the Kessler Institute, the New Jersey Commission for the Blind, the Mount Carmel Guild, the public schools in Newark, West Orange, East Orange, and so on.

It was felt that by developing this relationship we would better be able to utilize all of the resources available. With these facilities it would then become possible to promote realistic research in the field

of education.

I am thinking in terms of the best programs, equipments, methods,

and so on, with which to assist the handicapped.

The next point that I would like to make is in regard to the recruitment of personnel in special education. We feel that if a sound scholarship program were offered we would be able to attract a larger number of highly capable people into the field of special education. In terms of the program at Seton Hall, if a number of scholarships of about \$400 could be granted to people who are working for State certification and about \$800 to students who are planning to matriculate for the master's degree in special education that the caliber of student who would be interested would be extremely high.

Mr. Daniels. Mr. Suraci, at this point may I ask you a question? From your experience, have you a sufficient number of recruits who

are interested in taking a course in special education?

Dr. Suraci. As indicated by the increase in the size of the student population, yes. Where in 1954 it started off with approximately 10 students, now we have 150 students.

Mr. Daniels. What are the chances of their being employed

immediately upon graduation?

Dr. Suraci. To date all of our graduates have been employed in New Jersey. Further, I do have a number of vacancies in our employment placement bureau which we have been unable to fill at this time because of the demand for teachers in special education.

Mr. Daniels. Have any of these students refused to accept employment because of the fact that the compensation is inadequate?

Dr. Suraci. Well, I would rather say that they have given preference to communities which have a relatively good program of special education and this in turn is supported by the community's ability to pay.

Mr. Daniels. Perhaps I should have rephrased it. Do you know of any cases of your student graduates who have abandoned their career, so to speak, in the field of special education, because of their inadequacy of the salaries that have been offered?

Dr. Suraci. Yes, I do; not only at the teaching level, but at the

supervisory level.

The gentleman that I have in mind has currently left the field of special education to go into insurance because he could not afford to stay in it.

Mr. Daniels. You feel, therefore, that the salaries should be higher

than the average teacher's salary?

Dr. Suraci. Yes, I do; I think there are many others who share this viewpoint as indicated by an article in the 49th Yearbook of the National Education Association.

I have a few other needs which we feel are pressing. I will not

do other than to indicate them as a need.

First, the need for a continuous census in order to identify as soon as possible those children who are handicapped so that the best types of educational provisions can be made. The need for more facilities, physical plants, and equipment for educational and training purposes.

Of great importance is the need for further community relations programs, for public information to develop a greater public awareness and public support of programs in special education. There is a need for extensive parent and/or family counseling programs because of the effects which handicapped children place on the family. There is a need for additional diagnostic centers. There is a need for further institutional facilities for those who are more severely involved.

In regard to the institutional program we are thinking in terms of halfway houses, which is the type of residential school between the community and the institution where students may return to in the evening, be employed and participate in community living.

In other words, it is a halfway step between institution and the

community.

In conclusion I would like to say with the wealth of this Nation it would seem that money could be made available to promote the causes of special education, not only from the humanitarian point

of view, but from a practical point of view.

We know that without education and training these children frequently become liabilities to the families and to the taxpayers, but with proper education and training they may become useful contributing members of society.

Thank you.

Mr. Daniel. Thank you.

Are there any question, Mr. Chairman?

Mr. Quie. How big is Seton Hall University. Dr. Suraci. We have approximately 9,000 students.

Mr. Quie. You say you train teachers of the handicapped. Which

handicapped are you training teachers for?

Dr. Suraci. We train teachers for the area of the mentally retarded, the deaf and hard of hearing, the speech handicapped, the physically handicapped, and emotionally disturbed. Our program in the area of mental retardation is the largest phase of it.

Mr. Quie. I understood, from your testimony, that we would need more colleges providing training for teachers of the handicapped than

we presently have.

Dr. Suraci. I am sorry if I gave that impression. I meant that we have a number of smaller colleges and universities in the United States who are offering a program, but for reasons—well, at least in our point of view-financial reasons, they are unable to expand on the points which we have mentioned.

Mr. Quie. So the ones who are presently providing the training

would like to expand?

Dr. Suraci. Yes.

Mr. Quie. Are you going to have difficulty, if we do provide funds,

to expand the program to find teachers to train the teachers?

Dr. Suraci. This is a point which must be considered. I think that with financial assistance we will be able to attract a strong faculty.

Mr. Quie. That will take a little time, will it not?

Dr. Suraci. Yes, it will.

Mr. Daniels. What period of time has this program of special education been in existence at Seton Hall?

Dr. Suraci. Since 1954.

Mr. Daniels. Am I correct in understanding your testimony that you have 150 trainees?

Dr. Suraci. That is correct.

Mr. Daniels. What are the prospects of enlarging that in the future?

Dr. Suraci. Quite good, if the increase in enrollment in the last year is an indication. It is quite good.

Last year we had between 80 and 90 students who were doing work

in special education.

Mr. Daniels. Is it your thought that with the aid of grants or fellowships by the Government, the Federal Government, that other students would be encouraged into this field?

Dr. Suraci. Very definitely.

Mr. Daniels. Thank you very much, Mr. Suraci, for your testi-

monv.

Dr. Barnard. Mr. Chairman, I would like to request that the telegram just received from Mr. C. L. Eby, director of the bureau of vocational rehabilitation, be made a part of the record at this point.

Mr. Daniels. Without objection, it may be entered in the record.

(The telegram referred to follows:)

HARRISBURG, PA., February 19, 1960.

Hon. CARL ELLIOTT,

(Attention, congressional hearings, Jersey City, N.J.:)

I sincerely regret that my air transportation has been canceled and trains delayed. I will be unable to appear at the hearing scheduled for 2:20 p.m., Friday, February 19. I wish to compliment you and your staff for the manner in which the workshops were conducted and in providing an opportunity to appear before your subcommittee. Pennsylvania urgently requests that you report favorably on H.R. 3465. The passage of this legislation will create jointure of force between the medical profession, all rehabilitation facilities, workshops, and State rehabilitation divisions that will enable handcapped residents of Pennsylvania to be useful citizens.

Dr. Dice officially represented the Governor. She should have testified that the general assembly passed and the Governor approved the providing of service to the severely handicapped to achieve the ability of independent living, providing Congress amends the National Rehabilitation Act and appropriates the

Federal matching funds.

C. L. EBY,

Director, Bureau of Vocational Rehabilitation.

Mr. Daniels. Mrs. Herbert Carson, president, National Organization for Mentally Ill Children, Philadelphia, Pa.

Mrs. Carson, undoubtedly you have heard me limiting the other witnesses to 10 minutes in testimony.

Mrs. Carson. Yes, sir.

Mr. Daniels. The same limitation will be imposed on you.

STATEMENT OF MRS. HERBERT CARSON, PRESIDENT, NATIONAL ORGANIZATION FOR MENTALLY ILL CHILDREN, PHILADELPHIA, PA.

(The formal statement of Mrs. Carson follows:)

STATEMENT OF MRS. HERBERT CARSON

The National Organization for Mentally III Children, the organization I represent, finds in bill H.R. 3465 much that is encouraging. One most commendable provision is the concept that includes "mentally ill" under the term

"handicapped."

We in Fennsylvania have long sought to have the emotionally disturbed and mentally ill included in the all-embracing term "handicapped." A case in point is the campaign we waged to have the Pennsylvania educational law revised so that emotionally disturbed children would be included under the law which provides special education for all other handicapped children. In spite of our vigorous efforts, the law still excludes these children from such aid.

Here are a few statistics to point up the urgent need for special education. At the present time approximately 60 percent of Pennsylvania's handicapped children are receiving educational support. Unfortunately, as indicated, "handicapped" does not include emotionally disturbed children. The number of such disturbed children is tragically high. It has been estimated that 10 to 15 percent of the present classroom population requires help with emotional difficulties. If such help in the school system is unavailable, what now are minor problems can grow into major ones.

Outside of the school system such agencies as mental health and child guidance centers attempt to grapple with the problems. Unfortunately, such supplementary services are few. But even if they were more plentiful, they would still provide but a small part of the continual and intensive help that the seriously disturbed youngster requires. Such psychiatric and psychotherapeutic treatment on an individual basis, should be ancillary to a full and rich school program. Emotionally disturbed children, then, should be included under the umbrella term "handicapped children."

The long-range implication of the above becomes even more discouraging in light of the population increase expected by 1970. It is clear that the magnitude of the problem of planning mental health services for children far exceeds both

present resources and the attention that has been given it.

What of the child whose condition requires a controlled environment away from home? What is the alternative for the family which can neither afford nor find placement? The State hospital is a last desperate resource: With a guilty feeling that he is abandoning his child, the parent is forced to make this decision. This feeling is based on current public attitudes toward mental hospitals as well as the parent's awareness of existing conditions. What future can we expect for the seriously disturbed child in a crowded setting with little better than custodial care? The time has come to stop thinking of our mental hospitals as dumping grounds for incurable cases, and to begin orienting them toward returning the child to the family and community. If this is our objective, as it must be, then we must seriously consider and face the necessity of keeping the residential center physically within the community and of providing an educational and therapeutic program which will be constructive and beneficial.

If inpatient services are to be oriented toward returning the child to the community, we must face the overwhelming need for facilities to help the child make the transition back to the home and to stay there. Obviously, adequate day care centers could remove a considerable number of children from the hospitals and residential centers. Children who could benefit from remaining with their families are often prevented from staying with them because of a lack of a specialized group setting in the community. To meet this need, Valley Day School was set up in Bucks County as a demonstration day center geared to therapeutic education. The children admitted include schizophrenic and autistic children who had previously been excluded from public and private schools. The aim of the program is to reach the child and then to teach him. Even his fears and fautasies can be used as a bridge to reality and to academic learning. Results to date have been encouraging. Such centers, however, are pitifully few and the burden of keeping them alive with private funds threatens their very existence.

Many of the children now exempt from the public school system can utilize

a specially designed school setting within the public school.

In Pennsylvania we have even less advantages than some of our neighboring States which have enacted legislation providing for special education even though in some cases such legislation may be no more than declaration of public policy. We have been blocked in our efforts to establish facilities for special education, as we pointed out at the beginning of this testimony, by the basic failure to interpret the term "handicap" to include mental illness and emotional disturbance along with mental retardation and physical limitation.

It is obvious that in this field of special education, as in regular education, the States need the encouragement of appropriate and meaningful Federal action. Therefore, we respectfully submit that these are the responsibilities of the

Federal Government:

(1) To encourage legislation on State levels to include select mentally

ill children now deprived of a free education.

(2) To develop and disseminate leadership thinking through a national committee of experts on questions of the appropriate design for class settings, the selection and maintenance of teacher personnel and the use of ancillary clinical services to reinforce the primary educational function.

(3) To define what is meant by special education and to develop educational provision and methods especially adapted to the potentials, limits,

needs, and pace of mentally ill children.

(4) To develop and organize special training curriculum beginning with the undergraduate level and continuing through master's and doctoral programs that include special academic training and supervised fieldwork in approved diagnostic, educational, and therapeutic settings for mentally ill children.

To facilitate the above special education program, we further recommend:

(1) That a national body or organization (public or voluntary) be delegated with the responsibility of developing standards, training, special educa-

tion theory and practice in work with mentally ill children.

(2) That this national body, or organization, appoint a national committee or committees of experts from special education, psychiatry, psychology and social work to collect information on current thinking, experience and problems of those responsible for training programs and of those educators and clinical personnel directly working in special settings for mentally ill children, and to develop leadership and direction in all previously enumerated critical areas of special education for national distribution.

Let us now assume that the emotionally disturbed child with whom we have been concerned has completed his course of special education under the tutelage of specially trained teachers and is ready to choose a vocation. What now? Even the emotionally handicapped child can learn to follow a routine and studies should be made to determine those occupations he can enter which will use his abilities and allow him to function in an environment which does not offer too many pressures. This kind of occupational training and research for adolescents should be conducted at both inpatient and outpatient levels.

You have invited us to suggest how you can help us in the field of vocational rehabilitation. Here then are our recommendations for your consideration in

this area:

Federal and State Governments should work cooperatively toward-

(1) raising of standards in care, treatment and education of mentally ill children in State hospitals—with special attention to the needs of mentally ill adolescents for vocational guidance and training.

(2) provision of halfway houses for children ready for discharge from

inpatient facilities.

(3) provision for additional supporting services to child and family to protect previous therapeutic investments and maximize the child's ability to assume a limited though productive role in society. These must include sheltered workshops, protected employment, social and psychological services for child and family to support and enable the child or young adult to take and maintain his place in community living.

(Further details concerning the need for special vocational rehabilitation for these teenagers are included in this report, which I will not take the time to

read but am attaching for your further study.)

If we are to develop a new attitude of hope for these children, it cannot be done by propaganda alone. The community will change its attitude only when we demonstrate that something can be done for these children, and this can be shown only in the actual doing. We must act before another generation of troubled children become the mentally ill adults of the future.

Mr. Daniels. Thank you, Mrs. Carson.

Are there any questions?

Mr. Quie. I have one question. Since you are the president of the National Organization for Mentally Ill, you say in Pennsylvania the mentally ill are not included in the definition of the handicapped child.

How many States are there not included in the definition of the

handicapped child, similar to Pennsylvania?

Mrs. Carson. Many States. I know that New Jersey and New York just received a bill of special education for these children.

You see, we do have an existing school code for special education which includes physically and mentally handicapped, but the interpretation has been that mentally handicapped is only in regard to mentally retarded and does not include emotionally or mentally ill children.

This has been our problem in Pennsylvania.

Mr. Daniels. You do not know exactly how many States there are? Mrs. Carson. I don't think there are many States that do have these children included. I think it was 1949 and then in 1954 the bill was revised and amended which then included the mentally handicapped child.

So I am not too aware of the existence of bills in other States.

As I pointed out they are nothing more than public policy at this point. They are not mandatory bills. In New Jersey I know and I am not sure whether the one in New York is mandatory, or not.

Mr. Quie. You do not have a mandatory bill in Pennsylvania for

the education of any handicapped child?

Mrs. Carson. Yes, we do for physically and mentally—my point in the report being this, they did not interpret mentally handicapped which you have done so well in this report, and the thing that makes us feel quite good, that you have spelled out mentally ill rather than as a matter of fact, the thing that we are intending to do now is to get a reinterpretation from the attorney general because we, of course, are assuming that the mentally handicapped should obviously include mentally ill children as well.

There was an amendment 1339 which just failed which definitely spelled out mentally ill children. It was defeated very recently.

We are very unhappy about that situation at this point.

Mr. Daniels. Thank you, Mrs. Carson.

Mrs. Carson. Thank you.

Mr. Daniels. Our next witness is Mr. Roger Davis, executive director, the Goodwill Industries of Philadelphia.

STATEMENT OF ROGER DAVIS, EXECUTIVE DIRECTOR, GOODWILL INDUSTRIES, PHILADELPHIA, PA.

Mr. Davis. Thank you.

Mr. Daniels. Mr. Davis, you will be limited, as usual, as all the other witnesses have who appeared, to 10 minutes in the rendering of your testimony here.

If you have a written statement, you may file that with the re-

porter.

Mr. Davis. I do have a written statement, Mr. Chairman. I would like to merely make one or two observations and let the statement

Mr. Daniels. All right, sir, your written statement will follow

your oral testimony in the record, without objection.

You may proceed.

Mr. Davis. We are, of course, in Goodwill, very much interested in the parts of the legislation that deals with the expansion of shel-

tered workshops through Government grants.

But one observation which I would like to draw is that during the past 10 or 15 years many thousands of handicapped people have annually passed into the labor market without having to come through

sheltered workshops or special facilities.

What we feel is that in the age of automation which is now well underway, many of the people that have passed into industry, handicapped people, may well be coming back out of industry as a result of automation and perhaps be thrown on to sheltered workshops or need the facilities for retraining.

Consequently, this adds in my thinking, new significance to legislation that would aid in expanding sheltered workshop facilities.

While this is only an assumption on my part—actually the automation has not gone too far, we do not in the next 5 to 10 years in factories and offices—many of the handicapped people employed there are marginal—they will be the first to be released.

Consequently, a new challenge, perhaps a greater challenge than

we anticipate now will be thrown to the sheltered workshops.

I would like to thank the committee for its study in this field of legislation. I feel that whatever comes out of it will be most helpful in helping us to see the total job that has to be done.

Thank you.

Mr. Daniels. Mr. Robert F. Irwin, board member of the National Society for the Prevention of Blindness.

(The statement of Mr. Davis follows:)

STATEMENT OF ROGER DAVIS, EXECUTIVE DIRECTOR, GOODWILL INDUSTRIES OF PHILA-DELPHIA AND VICINITY, INC.

May I first take the opportunity to express, on behalf of the board of directors of Goodwill Industries of Philadelphia and Vicinity, Inc., and myself, our sincere appreciation to the subcommittee for the study it is making in the area of special education and rehabilitation.

As Benjamin Franklin once said, "It is easy to see, hard to foresee." Certainly the work of this committee and the report that it will bring forth cannot but help all of us in the field of rehabilitation to foresee the magnitude of the

challenge that lies ahead of us.

In seeing the problem of providing adequate workshop facilities for the handicapped in Philadelphia and vicinity, we would appreciate the subcommittee's

consideration of the following:

1. For the Philadelphia Goodwill Industries to meet the minimum needs of the type of handicapped people it serves, in its sheltered workshop facilities, we should establish at least four wholly integrated workshops in the Philadelphia metropolitan area. We currently have two workshops serving an annual total of 550 handicapped men and women. There are an additional 600 handicapped people on our waiting list.

2. To meet the needs of handicapped people in the area outside of the Philadel-phia metropolitan area, Goodwill Industries should establish two additional workshops in Reading, Pa., and Allentown, Pa. In these two areas, Goodwill Industries.

tries could be serving 250 to 300 annually.

3. As a member of Goodwill Industries of America, Philadelphia Goodwill along with 120 other Goodwill Industries throughout the United States comprises the world's largest voluntary nonprofit sheltered workshop association. In the past 10 years, Goodwill Industries has more than doubled the number of handicapped people that it serves annually. As such, it is my firm conviction that the voluntary agency approach in cooperation with State and Federal agencies has proven its ability to undertake the challenge of meeting the needs of handicapped people in the sheltered workshop area.

In its approach to serving handicapped people, Goodwill Industries does not attempt to center its program on the needs of just one or two areas of disability—rather ours is one that covers the broad scope of disability with no restriction

as to maximum age limit.

4. To provide the necessary facilities for adequate workshops, I feel the following must be accomplished by local, State, and Federal groups:

(a) Funds for new building construction.

(b) Funds for renovation and expansion of present facilities.

(c) Funds for modern training equipment.

(d) Funds for adequate professional staffing of present and contemplated additional facilities.

Mr. Daniels. The next witness will be the Reverend Francis LeBlanco, director, Apostolate for Mentally Retarded.

STATEMENT OF REV. FRANCIS LeBLANCO, DIRECTOR, APOSTOLATE FOR MENTALLY RETARDED

Father LeBlanco. I would like to thank this committee for the invitation to testify to the needs of special education in this area.

I feel that I have some small competency to discuss these needs with you, for during the past 5 years I have been working with retarded

children and their parents.

In my position as director of special education, both with the Mount Carmel Guild and the Archdiocese of Newark, I have personally arranged service in areas of religious instruction, social and recreational activities, as well as workshop, and psychological evaluation, for over 500 children of various ages and degrees of retardation.

From this experience certain needs mainfest themselves:

1. Nursery and preschool facilities: In this State as in many others, there is an incredible lack of adequately staffed and trained institutions for low grade retardates or for unwanted and neglected educables on the nursery and preschool level.

If some Federal funds were allocated to the States budgets, and scholarship grants made more accessible, some headway might be

made in overcoming this tragic lag in our resources.

If some Federal funds were allocated to the parent associations for retarded children and to other private nonprofit organizations to help establish accredited facilities, a great contribution to the welfare of these children would result, as well as the alleviation of great emotional and social problems for the siblings and parents.

2. Evaluation and diagnostic clinics: Since early diagnosis is paramount to proper planning for the retardate, more funds allocated to the clinics serving specifically the needs of the retarded, and for counseling of parents, would assure future success in adjustment

for both.

3. The retarded blind: At present there are few, if any, institutions to cope with this multiple handicap, with the result that many, if not all, are receiving no educational experience. Some consideration must be given these unfortunates and their needs.

4. The other retardates: Here we have a population of retardates, who are 16 years of age and over who for some reason or other have not seen fit to continue in existing school systems, or who have been

excluded for lack of academic ability.

The parents of these retardates are concerned for their eventual futures. Some of these are fortunate enough to fit into existing training programs sponsored jointly by the State, rehabilitation commission, and private agencies, but these facilities are all too few because of the financial restrictions placed upon such programs.

Some consideration in terms of financial security should be given

these agencies.

As it stands, many groups are frightened away from these training programs and workshops because of the chronic fear of insolvency.

At this point I would like to make a public statement of appreciation to the Office of Vocational Rehabilitation, especially to Mr. Salvatore DeMichael, to the New Jersey Rehabilitation Commission, which under the capable and dynamic leadership of its former director, Lawrence Houston, and its present directoress, Mrs. Carl Holderman, who have been responsible for most, if not all, of the training and sheltered

workshop programs in New Jersey.

A special word of thanks to Mr. William Seligman and Miss Gertrude Neary, who have spent many efforts to guarantee a service of excellence to the retardate.

Most, if not all, of the progress in this area is due to the New Jersey Rehabilitation Commission, and it is with sincere joy in my heart that I endorse the enactment of H.R. 3465, which will allow even more de-

velopment under such leadership.

One word of caution concerning this legislation: It will be as effective as resources of the commission which directs it, and some definite financial consideration should be given to the recruiting of counselors and other key workers on the State level.

At present our rehabilitation staffs are overworked, with amplification of services to the less feasible, they will be smothered, and the aim

of the total program will be frustrated.

I would also at this point ask consideration of the need to lower the age of eligibility for rehabilitation services to 14, this would enable a cooperative joint action between the rehabilitation and the school

system, to the eventual benefit of the handicapped client.

The rehabilitation commission with its wealth of employment training experience would thus be available to the school systems, and they, in turn, would cooperate in early discovery of candidates for rehabilitation services and in planning of curriculums to meet the needs of future vocational training for them.

Once again I wish to thank the committee for its invitation, as I feel that by participating in its work I am sharing in the fulfillment of a great dream, one in which all of God's children will benefit.

May Almighty God bless you and your work.

Mr. Daniels. We appreciate your coming here, Father LeBlanco.

and giving us your views.

Our next witness is Mrs. Armond Johnson, chairman, Legislative Committee, New Jersey Association for Mental Health, Montclair, N.J.

In the absence of response, I shall call Miss Lucy G. Morse, president, Maryland Occupational Therapy Association, Baltimore, Md.

STATEMENT OF PERCY CLARK, NEW JERSEY STATE HOSPITAL, MARLBORO, N.J.

Mr. CLARK. Mrs. Morse has not been able to be here. She has authorized me to present her findings, if this is in order.

Mr. Daniels. Without objection, the statement of Mrs. Morse will

be filed in the record.

Mr. Clark. I won't take the time to go through her report, because she has it prepared only to point up maybe two or three things she has emphasized.

She again emphasized the need for personnel and something she calls grants-in-aid to take care of this and to take care of recruitment and

publicity.

Mr. DANIELS. Sir, if you will file the statement with the reporter, the committee will give it its careful study and consideration.

Mr. Clark. Thank you.

(The report referred to follows:)

STATEMENT OF LUCY G. MORSE, OTR, PRESIDENT, MARYLAND OCCUPATIONAL THERAPY ASSOCIATION

Mr. Chairman and members of the committee, I am appearing here today as a representative of the Maryland Occupational Therapy Association to speak in favor of the proposed bill, House Joint Resolution 494, to provide for training of teachers of the deaf and for training speech pathologists and audiologists. I would like to speak also of the needs of the occupational therapy profession in my State.

PERSONNEL

There is a great need to increase the number of trained occupational therapy personnel to help make available vital services to those children and adults in our country who are in need of physical and mental rehabilitation. Today there are only 6,106 registered occupational therapists to meet this need. Compare this to the 14,000 military and civilian job opportunities currently available to occupational therapists. By 1962 the projected need is estimated at more than 15,000.

This is reflected in Maryland, for example, by the serious situation in the department of mental hygiene, where more than 15 positions have been unfilled by registered therapists for 4 years. Two of the larger hospitals in the Baltimore area, with a total bed capacity of more than 1,000, have been without trained leadership in occupational therapy due to the lack of trained personnel. There are currently five other hospitals in Maryland where there are no occupational therapists employed. The Maryland Occupational Therapy Association now has members from 21 institutions and agencies in all parts of the State. It is estimated that the organizations these therapists represent will need 30 to 50 additional therapists by 1962.

GRANTS-IN-AID

In order to facilitate the training of additional occupational therapists, it is urged that a program of grants-in-aid be developed to assist public and nonprofit institutions to assist such schools in the provision of this training. This grant-inaid program should include provision for recruitment and publicity. The State of Maryland has no academic training program for occupational therapists. One institution carries a clinical training program in affiliation with several schools in other States-Pennsylvania, Virginia, New York, etc. Students in Maryland who wish to consider this profession are often discouraged because of the expense of going out of the State for their education. Scholarship grants are needed covering all undergraduate training. To quote a member of the department of mental hygiene, "scholarships seem to be readily available for some professions but are limited or not available for occupational therapists."

RECRUITMENT

The Maryland Occupational Therapy Association has attempted to inform other professional associations of the primary importance of recruiting additional therapists. Lack of funds to do an adequate job has been a major difficulty. No institution has been in a position to pay for recruitment of students for a profession, especially if that training takes place outside the State. These institutions are fortunate if they can recruit qualified graduates for available positions. A grant for recruitment of occupational therapists in Maryland administered through an appropriate Federal agency or educational institution is definitely needed.

The Maryland Occupational Therapy Association would like to go on record as supporting House Joint Resolution 494. Occupational therapists do not work independently of others. Desired standards of care require good working relationships between the various professional groups included in the physical and mental rehabilitation of the handicapped. The professional personnel provided for in this bill are in very short supply. The passage of this bill will materially assist in filling a serious gap in services. While this represents a step in the right direction, rehabilitation requires a team approach. This dictates the need for adequate representation by all professions.

COOPERATION OF SERVICE AGENCIES

The provisions proposed in the independent living bill, II.R. 3465, also affect the occupational therapy profession. Occupational therapists work primarily in cooperation with health services, though in assisting clients to achieve rehabilitation goals they work closely with the division of vocational rehabilitation. Therapists in community work also cooperate with public welfare agencies. It is important that cooperation between agencies performing these services be strengthened.

EVALUATION

There is a need for all health and rehabilitation agencies to include a formal method of evaluation as a part of their total program. To be effective evaluation services must be available on a continued basis. The division of vocational rehabilitation in Maryland has established two adult evaluation clinics. The Heart Association of Maryland has a work evaluation unit. All are studying practical methods of evaluating disability, and for cardiac clients, of determining employability. Frequently, clients who are found to be not quite ready for competitive employment are referred to occupational therapy for work tolerance training in the home or to sheltered employment. In Maryland this kind of referral is only available in Baltimore City and two counties due to the lack of personnel, facilities, and funds.

DEMONSTRATION

Additional Federal funds will play a valuable role in creating new opportunities for demonstration projects that are vitally needed in the general field of independent living. An even greater need is for a pilot study of a whole population area to determine the total unmet needs of the handicapped. To our knowledge no such evaluation has been completed.

SHELTERED WORKSHOP

In Maryland, 30,000 disabled persons require rehabilitation services to achieve a satisfactory employment adjustment. In 1959 the division of vocational rehabilitation had contact with 8,257, or 27 percent of these citizens. Occupational therapists serve largely during acute and early convalescent stages of rehabilitation. The problems of the aging and the chronically ill require longer service. Many occupational therapy patients are not eligible for rehabilitation services under the present law. The cooperation of the division of vocational rehabilitation and the local sheltered workshops has been of great value in providing a continuing service. Unfortunately, these facilities and services do not satisfy total patient needs. The independent living bill will help to meet some of this need.

The average occupational therapy department is not equipped to simulate normal working situations for their patients. Sheltered workshops in Maryland have been unable to absorb those who need relatively short work tolerance or testing training due to lack of facilities and money. The Goodwill Industry of Baltimore needs to at least double their present work area. The lack of money to finance the training of a relatively nonproductive client in this stage of his rehabilitation is a typical reason given for not including a large enough program of this kind in Maryland sheltered workshops. There is need for a pilot study to determine community needs for sheltered workshop facilities. Physicians in charge of rehabilitation programs in Baltimore city hospitals, Montebello State Hospital, Johns Hopkins Hospital, and the Heart Association of Maryland all state there is a need for sheltered workshop employment of persons who need short-time testing or work tolerance experience.

persons who need short-time testing or work tolerance experience. The Maryland Division of Vocational Rehabilitation has 35 professional staff members and needs 100 just to adequately administer their current program. The independent living bill will add to this difficulty by adding new services such as homemaking. We believe this to be a needed service. However, if adequate provision is not made for trained professional personnel these additions in services will obviously represent no increase in total service. Another example of this is given on page 16 of the bill, lines 11 and 12. There is difficulty in securing occupational therapists for positions that are currently open. The problem of lack of trained personnel to provide rehabilitation services is a far greater problem than lack of facilities.

The Maryland Occupational Therapy Association endorses H.R. 3465 as a step forward toward meeting total patient needs for rehabilitation services.

Mr. Daniels. Mrs. Eone Harger, chairman, New Jersey Commis-

sion on the Aging, Division of Aging, Trenton, N.J.

Mrs. Harger, all of the witnesses have been limited to a period of 10 minutes in their testimony. I note that you have a statement. Perhaps you might want to summarize your views, in which event your prepared statement will follow your oral testimony, or you may read from your statement, whichever you desire to do.

You may proceed.

STATEMENT OF MRS. EONE HARGER, CHAIRMAN, NEW JERSEY COMMISSION ON THE AGING, DIVISION OF AGING, TRENTON, N.J.

Mrs. HARGER. Thank you.

I am going to speak very briefly. I won't take the 10 minutes because I am endorsing what some of the other State agencies have

testified to before you.

I am very happy to have an opportunity to come here and give this endorsement. I come from what is called the division of aging and we do not do any direct service. We are a coordinating and a research and community organizing agency.

What I would like to do is support the principles which you have

put into H.R. 3465 and H.R. 119.

We studied them in our division and have based an evaluation of them on our accumulated knowledge of the needs and resources of the aging in New Jersey, plus our knowledge of the experience of the rehabilitation commission and the department of health and other agencies which deal with problems of older people.

We probably are already aware that here in New Jersey we have

a great many aged people, that is, people over 65.

In 1950 it was nearly 400,000; in 1960, we know it is well over

500,000—a half million.

We generally accept that this aged group is subject to more illness than the other groups in the population and we do know they don't have the economic means to pay for the rehabilitation.

We feel that many of them could be rehabilitated to self-living,

taking care of themselves if there were facilities available.

This has been demonstrated in a project in Essex County. If this could be extended to other parts of the State, we think in terms of human values and in terms of actual dollar value to the people of the State, it would be tremendously useful.

It is our conviction that the provisions which are contained in these bills which you are having hearings on today are a progressive step

in the conservation of human resources.

Whenever members of society, whatever their age, are restored to maximum potential as functioning citizens, society will benefit.

We would like to see these principles put into operation.

Thank you.

Mr. Daniels. Thank you, Mrs. Harger. Your written statement will follow your oral testimony.

Mrs. Harger. Thank you.

(The formal statement of Mrs. Harger follows:)

TESTIMONY PRESENTED BY MRS. EONE HARGER, DIRECTOR OF THE NEW JERSEY STATE DIVISION OF AGING

I wish to thank the committee for inviting me to attend these hearings and

submit testimony, which will be very brief.

The division of aging is a coordinating, research, and community organiza-

tion agency; it does not provide direct services to older people.

We firmly support the principles of H.R. 3465 and H.R. 119, which we have studied thoroughly: Our evaluation is based on our accumulated knowledge of the needs and resources of the aging in New Jersey plus our knowledge of the experience of the rehabilitation commission, department of health, and other State agencies within this area of concern.

In 1950, there were 393,989 people over 65 in this State—in 1960 it is estimated that there will be 508,660. It is generally accepted that this age group is subject to debilitating illness. It is also generally accepted that the average person over 65 does not have the economic reserves to pay for adequate restorative

It is our conviction that the provisions contained in the bills in question represent a progressive step in the conservation of human resources. When the members of a society, whatever their age, are restored to their maximum potential as functioning citizens, society inevitably benefits.

Mr. Daniels. Is Mrs. Jane Davis Ellen here?

I notice you have been sitting here all morning. You have heard my admonition to the other witnesses, so I will not repeat it.

STATEMENT OF MRS. JANE DAVIS ELLEN, EXECUTIVE DIRECTOR, MARYLAND SOCIETY FOR THE PREVENTION OF BLINDNESS, BALTIMORE, MD.

Mrs. Ellen. I don't have very much to say. I will try to make it brief.

My presence here is as a representative of, primarily, the Maryland Society for the Prevention of Blindness, our parents' committee for the children with partial sight, and the informal thinking of the teachers of partially sighted children in the public school system of the State of Maryland.

I would like to say that our concerns are primarily confined to those of children with visual handicaps who are not presently eligible for the educational material and services provided for those who fall

within the definition of legal blindness.

In considering unmet needs of visually handicapped children, it was the consensus of our group thinking that the greatest basic single need was a redefinition of the terminology which is now employed to describe the visually handicapped particularly if there was to be any intelligent consideration or discussion of unmet educational rehabilitation needs.

Such definition would distinguish the truly blind, those without

useful light perception from the partially sighted.

The partially sighted would then need to be classified on the basis of the type and the degree of sight loss as well as the functional capacity and functional disabilities of the individual. In this way the needs of visually handicapped individuals could be met each according to his particular requirement.

Our recommendation, therefore, would be that there be some appropriate means provided at the national level to arrive at a functional definition of visual disability. This is not intended or implied to mean that any present services be curtailed or discontinued. It is intended to expand the existing provisions to include primarily at this point children who are visually handicapped, but not legally blind.

It was the feeling of the group that in considering special education and rehabilitation of these children that there are needed more valid means of measuring intelligence and achievement. This would, therefore, seem to suggest that research is needed in the field of the development of appropriate testing material in which the visual dis-

ability would not mask the test result.

In line with our other basic recommendation of a redefinition of the visually handicapped, we would hope that there would be further development, production, and distribution of a variety of educational material, records, tape recordings, large type books, and other equipment.

That these materials be provided again on the basis of the in-

dividual need, not on the definition of legal blindness.

Our recommendation would include, of course, increased Federal funds for the production of such material. It was felt in the relationship of special education for vocational rehabilitation that the answer to this problem will probably have to be met in light of local existing services and facilities, but that vocational rehabilitation should be legally permitted to make its services available to special education of the visually handicapped as may be needed in the solution of individual case problems.

At the present time there is a consulting guidance relationship, but in individual instances there needs to be available a more direct kind

of service.

The other great unmet need we felt for the visually handicapped was an orientation or counseling service for parents of preschool-age, visually handicapped children. I think we would even place this ahead of actual preschool education of these children simply because it is in the formation of attitudes toward the physical disability that to a large extent determines the ability of the child to take advantage

of the opportunities then provided.

I would like to say that we have not formulated a statement in relation to the special education of the multiple handicapped child, those with visual disabilities as well as others, and feel that in the light of other things that have been said here this morning there is great need for provision of educational services for children with a combination such as frequently happens with cerebral palsy, vision, mental retardation, and so on.

Thank you.

Mr. Daniels. Thank you. Are there any questions?

Mrs. Ellen. Thank you for the opportunity.

Mr. Daniels. I would like to call at this time Mrs. John Cummings, of Jersey City.

STATEMENT OF MRS. JOHN CUMMINGS, JERSEY CITY, N.J.

Mrs. Cummings. My name is Gertrude Cummings.

Mr. Daniels. Mrs. Cummings, I would like to say before you start your testimony that we must limit each witness who appears to not more than 10 minutes in this testimony.

Mrs. Cummings. All right. I am not prepared and I am not a public speaker, so you will have to put up with any kind of mistakes I

nake

I speak on behalf of my son who is 16 years old. At present he is doing nothing. He is sitting at home. I have gone through every

kind of means to try to get some help for him.

Right now he is capable of doing third and fourth grade work. There is nothing physically wrong with him. He is a good, healthy child. He right now should be learning a trade. He cannot fit into any of the regular schools here in Jersey City because he can only do third and fourth grade work but does not belong in the regular grammar school because he is too old.

He has attended parochial and public schools here in Jersey City. He just kept getting left back because they do not have time to put

up with a chilld like that.

I have had to take him out and—at very great expense to me which ran into thousands of dollars—my son had to attend a private school, just part time in New York. This man let my son come there at a great discount because I could not afford it. Even so, it has drained us of all our funds.

In the meantime my son traveled there. I had to go with him at first. Later, he traveled by himself. Right now I know that he is not going to be a scholar, but my son should be getting some sort of

training.

I think there are many other children like him. This you can see right from the beginning when a child is in the first, second, or third grade. These things are noticeable. They told me about it, but they could not do anything about it. Nobody could instruct me where to go or what I could do.

I think a child like that should be started in a trade right at the beginning. Years ago they used to have apprentices. In this way they learned something. He is capable of doing some work. I have also inquired about a trade school and I know a very good one, but

he would have to be at the high school level.

Right now that is my problem. Something should really be done with these children. Not just a lot of talk because I get that all over. Something definite. I think this Government really should do something for these children. He is an individual like anybody else and he is entitled to some training.

Mr. Daniels. For the purpose of the record, will you give us your

home address?

Mrs. Cummings. My address is 257-A Fifth Avenue.

Mr. Daniels. Have you always resided in Jersey City, Mrs. Cummings?

Mrs. Cummings. Yes.

Mr. Daniels. Your son was a student of the Jersey school system?

Mrs. Cummings. Yes.

Mr. Daniels. What, in your opinion, is the nature of the handicap

that your son is suffering from?

Mrs. Cummings. They considered it an emotional disturbance, a slight emotional disturbance. He is one of these children who can't seem to take to schoolwork. He is absolutely no behavior problem. He has nothing physically wrong with him.

Mr. Daniels. When did this condition first make its appearance? Mrs. Cummings. He was left back in the first grade, and then it continued. That was the first time I had seen it. I thought he would need some more time, but later on I could see he needed some special

training.

They wanted to put him in a special class and from what I understand a special class in Jersey City is a mixed group and he would sit there. I don't want that. I want to bring out the best I possibly can. I want to teach him a trade. I don't have anybody that is a plumber or carpenter that could take this child and help him get

Mr. Daniels. You see, this committee is making a study in the field of special education and rehabilitation. We know that there are many, many shortcomings in the school system, not only in Jersey City, the State of New Jersey, but also in the other 49 States of this

country.

We thought that, because of those shortcomings and the problems that arise, something should be done about it. That is the objective of this committee: We would like to know what those shortcomings are, what the role of a Federal Government is in these various areas. and what we can do to assist the States and the local communities in developing a program for the assistance of boys and girls and the children similar to your child.

Just exactly what will be done, we are not in a position to say, because this is the fourth regional hearing that this committee has conducted and we have other hearings to conduct in other parts of the country. Upon the conclusion of this study we will make recom-

mendations to Congress.

Mrs. Cummings. Yes, I hope you really will.

Another thing, you may not be able to help my son because he is quite old, but there are many boys like him. If you would care to investigate you can see they are pushed from one grade to another because they are too old to stay in their classes.

Mr. Daniels. Mrs. Cummings, we have been listening to testimony for the past day and a half. We have done so in the State of New York for 2 days, in New Haven, Conn., and in Cullman, Ala. Next

month we are going out West to study the problems.

I want to tell you that, more or less, these problems exist in each and every area. They may differ in degree, but the problems do exist almost everywhere.

We are looking forward to proposing legislation to Congress and hope that our colleagues in the Congress will accept our views.

Mrs. Cummings. Yes, Dr. Earl Taylor, from New York, who has run the school, has had great experience in treating children like that, also. That is where my son has had his training.

Mr. Daniels. I am very pleased and happy that you came here. I want to congratulate you for coming forward and speaking so frankly about your problem. You are to be commended in coming here to express your views.

Mr. Quie. What kind of training did your boy receive in the New

York school?

Mrs. Cummings. First of all, they have some sort of machine—I don't remember the name, it is a technical name-where he had to first exercise the muscles in his eyes. After that he had special training, he had a private teacher.

Whatever he needed they went along with him at first. Because of all of this he had become very frustrated and upset and emotionally disturbed because of this pushing around from one school to another.

We wanted to bring out the best in him. They tried to work with him right with his problem from the beginning. They gave him the

regular academics only.

Mr. Quie. There is no vocational training?

Mrs. Cummings. No, that is why he had to leave. I know he grasped as much as he was going to. Also, because of his age, I thought it was time for him to start on a trade.

Mr. Giaimo. When did your son first receive diagnostic investiga-

tion?

Mrs. Cmmings. I think it must have been around eight or so. That was done at the Stevens Institute. I took him there at my own expense. The most that they had told him was that it was a great anxiety and emotional disturbance.

Mr. Giaimo. That was done only because you suspected there was

something wrong?

Mrs. Cummings. That is right.

Mr. Giaimo. There was nothing done before that in the school

Mrs. Cummings. Absolutely nothing outside of maybe the regular IQ test that they give them. All they did was give me words of sympathy. Not one teacher in either the public and parochial schools could even advise me to go anyplace.

I had heard of this school through a man I had started to study with to be a beautician. This man had sent his daughter there because she also had some sort of reading problem or something. He told me

about the school. I took my son there.

Mr. Giaimo. Thank you.

Mr. Daniels. Thank you, Mrs. Cummings.

Mrs. Cummigs. Thank you again.

Mr. Daniels. Now I turn the chair back to our chairman, Mr. Elliott.

Mr. Elliott. Thank you very much.

Now the next thing that I desire to do is to present the statement of U.S. Senator Harrison A. Williams, of the State of New Jersey, which written statement in connection with this matter has just arrived.

Without objection, this statement will be made a part of the record

at this point.

(The statement referred to follows:)

STATEMENT OF HON. HARRISON A. WILLIAMS, A SENATOR FROM THE STATE OF NEW JERSEY

Thank you very much for offering me the opportunity to present my views to your committee on the unmet needs in special education and rehabilitation and the role which the Federal Government can take in assisting local committees to find a solution to some of the most urgent problems in these fields. The committee is to be commended for taking the time and effort to make this much-needed study. The committee's program of holding regional public hearings in order to better assess the adequacy of existing services and the particular needs of special education and rehabilitation throughout the country is particularly worth while, since the need for more information and better understanding of the problems in this area is very great.

It is my desire to address myself this morning particularly to H.R. 3465, a measure introduced by the Honorable Carl Elliott, chairman of this subcommittee. As I am sure the members of the committee know, S. 772 has been introduced by my esteemed colleague, Senator Lister Hill of Alabama, and is presently before the Senate Committee on Labor and Public Welfare, of which I am a member. This bill is similar to H.R. 3465 and is intended to achieve the same

purposes.

At the time our National Legislature amended the Social Security Act to provide for cash benefits for the totally disabled over 50 years of age, it was also provided that the rehabilitation services of the various States would review applications for such benefits before they were granted. Since this program has been put into practice, a great deal of information with respect to the disabled has been developed. Persons working in this field have discovered that there are a tremendous number of disabled persons who are not presently eligible for the benefits available in our various Vocational Rehabilitation Services because of the proviso in the law governing the Vocational Rehabilitation Service which requires that the applicant for rehabilitation be employable after a program of rehabilitation. Many of these people are patients in nursing homes, in our public and private hospitals or are receiving attendant care at home. In short, these people are unable to care for themselves and are presently public or private charges. They occupy bed space in our sorely overcrowded hospitals, although in view of the other needs of the community which the hospitals must serve, there is no proper basis for their hospital stay. Whether the nursing homes bepublicly or privately supported or these unfortunate people be patients in their own homes or the homes of relatives, the cost of their care is being borne in many instances by the community at large. In those instances where private funds are supporting the care of these unfortunate individuals, it is almost a truism that sooner or later they will become public charges. These individuals have lost the independence that they might have, have lost the opportunity to lead the active lives that they might lead, have become a greater burden on their families or society than is necessary and constitute a social cost to society as to all the idle. There is no end in sight to the need for their care because there is no organized program for their rehabilitation. This legislation would make a good start in this worthwhile effort.

The provisions of this legislation would provide grants for independent living, rehabilitation services for persons requiring institutional care or attendance in their household, to enable these persons to achieve a measure of independent living sufficient that they will no longer require such institutional care or attendance, and be of great help in meeting the problem which I have previously described. I believe that it would not be incorrect to say that a successful program of this nature will actually reduce the public's present welfare cost by more than the amount of money expended in this effort. It should also materially reduce the cost to the public of providing for additional hospital beds for the care of these individuals. Certainly it will make more hospital beds available for other types of more urgent medical and surgical use.

The legislation would also provide funds for evaluating the nature and extent of the disabilities and rehabilitation potentials of handicapped individuals. Too often there is a breakdown in the rehabilitation of the individual because of a lack of a comprehensive diagnosis of the disabilities of the individual and a particular program for rehabilitation predicated upon adequate knowledge of the disabilities. With the funds and program available under this legislation,

if enacted into law, much can be done to cure this difficulty.

Here in New Jersey we are aware of the urgent need to establish more workshops and rehabilitation factilities as aids in the rehabilitation of the handicapped and to furnish employment opportunities for the handicapped who are confined to their homes. We desperately need more facilities to provide prevocational therapy, vocational training, and other types of occupational therapy and training. We are also in need of expanding this sort of service within the framework of an integrated program under the aegis of competent professional supervision. I am, therefore, particularly anxious to support title III of H.R. 3465 which provides funds to meet this need. In our State much has been done by our State government and by interested volunteer workers, but we have only scratched the surface when one considers all that might be done in this field.

Even as this committee meets, our Nation is locked in a struggle for survival as a free nation and as the leader of free nations throughout the world. Among our handicapped citizens are many, many people who would, if they could but get the proper training and opportunity, make a substantial contribution to the economic strength of our country. This legislation would not only make this positive contribution possible, but it would also help to eliminate the economic drain of relief and other welfare programs which help to support many of our handicapped but do not enable them to become useful members of our society.

In view of the great need for the entire program contained in this legislation and in view of the positive benefits which all of our citizens will obtain if the program embodied in this legislation is put into effect, it is a privilege to testify

before your committee in its support.

Mr. Elliott. Now, is Mr. Albert I. Oliver here? What is your field, Mr. Oliver.

STATEMENT OF ALBERT I. OLIVER, ASSOCIATE PROFESSOR, UNIVERSITY OF PENNSYLVANIA, PHILADELPHIA, PA.

Mr. Oliver. My main work is known as curriculum development in teacher education.

Mr. Elliott. You may proceed.
Mr. Oliver. I have here a statement which I will present for the record. I don't know whether you care to have me read it, or rather have me make a few summary remarks.

Mr. Elliott. You may proceed for 10 minutes, Doctor. You do it

whichever way you think is best.

If you decide to summarize it, then the full statement will be made a part of the record following your oral remarks.

Mr. Oliver. All right.

I am here representing the group known as the gifted. In special education there are two terms which we sometimes associate. One is that of the handicapped and I suppose you could make a case for the point that being a person with brains might be a handicap under some conditions.

We know that many youngsters in schools sometimes have difficulty with their own group because they don't want to be known as brains.

We also recognize that people with physical handicaps and other kinds of handicaps may have high mental ability and as such are classified in that category.

Actually, in the bulk of the people with whom we are concerned I think the word exceptional is the word that we are concerned with.

This is a relatively small group perhaps, but we feel that particularly in terms of the great needs for both manpower and mindpower here in the United States that this group is one that is greatly neglected in our school.

For example, fewer than half of the upper 25 percent of our high school students ever enter college and finish getting college degrees.

We know in many cases that people have high ability, but do not operate at that level and are known as unachievers.

There are, depending on how you define this, from a million and a

half to 2 million gifted children in the United States.

Mr. Elliott. How do you define the gifted, Doctor?

Mr. Oliver. I would, first of all, tie this word in with mental superiority because sometimes the word gifted means a person who can play a piano or something like that. This is a kind of gift-

Mr. Elliott. Is that what you call a real gift?
Mr. OLIVER. I think, however, if you found a person who was a topperformer in the musical field, he also would have high mental ability to go along with it. So there is a rather high positive correlation of these attributes.

But educationally speaking, we are concerned with those people who

are probably in the upper, roughly, 5 percent of our population.

Mr. Elliott. How do you correlate that term of the gifted, the upper 5 percent, with what we commonly refer to as general use?

Mr. OLIVER. When you get into the general use category you probably have less than 1 percent. A general use would be 1 out of 10,000-160 IQ if you want to use that index. Whereas, the group I am talking about would be roughly 125 IQ or better, although we would want to indicate that in identifying these people, which is one of our basic problems, that the IQ is not in itself sufficient.

There are other factors that need to be considered.

Mr. Elliott. In determining the gifted?

Mr. OLIVER. That is right.

Mr. Elliott. What are some of those other factors, Doctor?

Mr. OLIVER. The IQ of course, is simply determined by a particular test which is to some extent culturally determined. We have, for example, many youngsters—and they might be called handicapped in a cultural way—who have great ability, but because of the paucity of their environment, have not been able to produce effectively in our schools which are very much geared to verbal earning.

We also have, as I indicated, many youngsters who because of boredom—and I think this is one of our problems of the usual school program—or because of the fear of being labeled a brain, do not

operate at their optimum level.

In one particular area, I am concerned about creative or originality. Mr. Elliott. I want you to expand on that a little bit, Doctor.

Mr. OLIVER. This is the kind of person who can go beyond the obvious, first of all. He is the kind of person who will see new relationships between facts, between ideas.

We have had for the past several summers at the University of Utah a series of workshops on creativity. They have identified about

28 characteristics of creativity as it is used on the job.

One of their comments, and this is why I was bringing this point in, is that, first of all, in the usual school test you have to go down about item 20 before you find a characteristic that is in their list of 28 in the area of creativity.

Secondly, they feel that the usual school program does not particu-

larly foster creativity in addition to failing to identify it.

That is why I say I would look for these qualities of operation.

Mr. Elliott. Do not these qualities of creativity sort of assert themselves in spite of the school? I see a gentleman shaking his head

back there, but I disagree with him. I think they do.

Mr. OLIVER. We have many cases where they do. I gave two or three reasons why a youngster in his own personal relationship to the school will not produce. One of our serious problems is that of the so-called underachiever, who perhaps should operate at the upper 10 percent, but is operating maybe down actually the upper third.

Mr. Elliott. Is that not because of the fact that he has not found the motivation of his life yet? Do not those fellows frequently find that motivation at maybe 20 years, or 30 years, even, and then those of us who are less fortunate have to get out of their way, so to speak?

Mr. OLIVER. This would be true in individual cases. In general, when you study the people you find that in the ones who are highly productive in ideas and other areas this comes fairly early in life.

You mentioned general use, which, of course, is a little bit of a category, but most of the people who are most productive do that and as a result of stimulation from the school or from individuals, but if they get bored with the school or if a youngster has to plod through, let us say, in science, some simple experiments in chemistry when at home he has his own chemistry set, he is way ahead of that, or in English class he read the book 5 years ago, it does not take very long for him to get discouraged.

We have evidence, in fact, yesterday we received this, 50,000 potential college graduates quit high school each year. This is not neces-

sarily the gifted category in and of itself, but the potential.

Mr. Elliott. How are we going to awaken that motivation in these youngsters, and that goes for the bright and those less bright, too? That, it seems to me, is one of the real problems of this age

and perhaps every other age.

Now, there is a tendency in modern writing in this field to completely overlook the value of self-discipline. Yet those of us who have had experience in trying to put together an army of civilians, who have had practically no discipline, find that discipline is absolutely necessary and that once this army is disciplined it goes out and gives a fine account of itself in accomplishing its objective.

I do not know how we work in the concept of discipline into this

development of creativity and motivation.

I do not know that is done, but it seems to me that this is the real problem and that the lack of discipline may have something to do with this terrible boredom that you and I are familiar with, where our children do not achieve as much as we would like them to achieve.

Mr. OLIVER. I should like to make two comments on that: First of all, I think that we recognize the problem, but one of the reasons I am appearing here and one of the proposals I am making here, which I do not need to go over, is that there is very little coordinated study or research on this problem.

We need this kind of thing. We have very little research on the gifted as such. There have been things that have been tried, but

not studied carefully.

The second thing is that when you are talking about discipline and organization, this creates a dilemma for a school person because a highly intellectual person tends to be a nonconformist.

When we try to mold him into the usual pattern of teaching and thinking and our curriculum, then he is either frustrated or becomes bored, or goes along to avoid any conflict, but does not develop this

plus value that you and I are concerned about.

One of the problems that we have in our teacher education is to get both teachers and administrators aware of the fact that you have to handle these people differently, that you must be able to know where conformity of the usual type in education will stop and the nonconformity of the frontier thinking, the frontier action, will take off.

This, again, is an area in which we need both research and we need leadership and we need a considerable amount of inservice training,

which is another one of my points.

Mr. Elliott. I do not want you to misunderstand me because I agree with the accomplishments of our civilization. Most of us are well housed and most of us obviously eat well, dress well, and have a few of the things that bring "good living," as we define it.

I am all for that, yet it seems to me that the great field of the motivation for the development of creative talents—certainly in an age

gone by-grew out of necessity.

Maybe we do not have as much necessity in our daily living to bring about the invention, to paraphrase one of our old proverbs. Maybe the lack of necessity of this age is keeping some of our geniuses smothered.

I do not know. I have enjoyed ideas that you bring us. I realize as time goes on that we have to meet, head on, and wrestle with this problem that you are pioneering in right now. We are merely scratching the surface now. We must recognize it, must legislate and do other things necessary to take the enormous advantage of the genius and the gifts or our people.

I agree with that 100 percent. I recognize the gentleman from

Connecticut.

Mr. Giamo. Mr. Oliver, as a member of this subcommittee, I have always been interested in the problems of these gifted people. But I wish you would explain this to me: I can see the need in many areas for Federal assistance and Federal intervention in the field of handicapped, but I am not quite convinced I can see why the gifted should be a Federal problem.

Will you give me your thoughts on that.

It seems to me that if there is a breakdown, that it is a breakdown on the local administration of education; that they are gearing education down to some medium and not taking care of these top level students.

I have always claimed, in fact, in my own State that they were doing this and that they had better change their method of thinking and start worrying about proper and adequate training for the top level training for the bright or brilliant students.

What interest should the Federal Government have in this problem?

Is this not a local administration of education problem?

Mr. Oliver. To some extent it would be so. First of all, there is a factor of cost in it. There have not been very many places—

Mr. Giamo. Let me interrupt you right there. If it is not a question of cost, should it not be part of the other problem that the full

committee has as to cost of regular general education; in other words, Federal aid to education, the Murray-Metcalf bill? Should it not be part of general education, because the handicapped are going to be competing, in a sense, for a certain number of dollars?

I wish you would fit the gifted into that group for me, if you can. Mr. OLIVER. It seems to me that this is in terms of a manpower need, and as such, this particular group is considerably neglected in

many ways.

Now, it is true that much can be done at the local level, but a couple of points that I was making was that one of the things that to guide the people at the local level we need some research on a national scale. We need an extension of the U.S. Office of Education to exercise leadership; we need an extension of the NEDA, particularly in titles III and V, to cover this at the elementary level as well as the secondary school level, and in areas other than mathematics, science, and foreign language.

Those would be points in which I think the National Government

particularly is interested.

It is not stated in here, either, but it might merit consideration that these United States should set up something which we might call a national academy of mind power in which our best minds would be brought together in research centers throughout the United States.

This would, of course, be at the graduate level; whereas I have been talking primarily about the student in the elementary, secondary,

and perhaps early college program.

Mr. Giaimo. Now, if we get into that field, are we not going to run into the situation where we are going to be charged with taking over local education? If we start a nationwide project to determine what should and should not be done with the gifted, are we not running into the age-old bugaboo that the Federal Government is getting into the field of education? Of course, this is taboo.

Mr. OLIVER. There is possibly this reaction on the part of some people, but I have worked with school committees and with whole school systems all over this part of the United States; in fact, right

out here in Summit, N.J., last year.

I find that they are crying out for help and they are not able to get

it from the existing agencies.

Their own districts do not have the trained personnel; there is not enough information; there is very little material; there is a lot of a rather superficial nature.

We just are not getting it under the existing pattern. It would seem to me that some coordinated agency both in research and in the

dissemination of information would be highly necessary.

Mr. Glaimo. Are you familiar with Public Law 531, the cooperative research program, that provides aid for research in this area?

Mr. Oliver. No.

Mr. Giamo. I wish you could convince me of why the gifted should be part of this handicapped field because I know that at any time legislation of this type comes up on the floor of Congress, this is going to be one of the great arguments. They will say, "We can understand why you need speech pathologists and speech therapists and we can understand why you need sheltered workshops or half-way houses, and so forth, for the physically and mentally disabled; but we feel

that the gifted problem is strictly one of local education where they are falling down on the job, and we do not see why Federal money should be appropriated for it."

I can see this argument very clearly. Frankly, I cannot see myself

in a position to answer it.

Mr. Oliver. In my opening remarks I tried to anticipate, at least, the use of the terminology that I don't consider these people in the bulk in the area of what you would call handicapped, at least in the usual sense, although I would point out again that there are people who are handicapped in other ways who have fine minds, and that

would bring them into both categories.

But if you think of a special education as concerned with the exceptional child and if you think of education as concerned with individual differences—to me this is why I, as a curriculum person, am interested in the problem. We have, for a long time, said that our educational program should be concerned with providing for individual differences and challenging each person at his level, whether he is mentally retarded or whether he is mentally able.

It is just a continuum. If you apply the principle at one end of

the scale, I think the principle should be applied equally to the other

end of the scale.

Mr. Giaimo. There is no question what you are saying is so, but the question is which education should apply these principles, local, State, or Federal?

This is where I am in doubt.

Mr. Oliver. I would simply say that if you can build a case for the mentally retarded and Federal aid, I think the principle behind it is just as applicable to the mentally able.

Mr. Giaimo. Thank you. That is all, Mr. Chairman.

Mr. Elliott. Thank you very much, Mr. Oliver. Mr. Oliver. Thank you very much for listening to our problem.

(The formal statement of Mr. Oliver follows:)

STATEMENT BY ALBERT I. OLIVER, ASSOCIATE PROFESSOR OF EDUCATION, SCHOOL OF EDUCATION, UNIVERSITY OF PENNSYLVANIA, PHILADELPHIA, PA.

THE GIFTED AND HIS EDUCATIONAL NEEDS

I. Introduction

A basic concept of democracy is the worth of the individual. Translated into educational terms, this means the devising of educational plans and opportunities so that we may provide for individual differences of all types and kinds-from the mentally retarded to the mentally able. Increasingly educators and educational groups have been turning their attention to one segment of our student population known as the gifted, generally conceived as those of superior mental ability. I am pleased to have this opportunity to present to you briefly some thinking as a representative of at least three important organizations: That is, I appear before you as president of the Association of Gifted Children, a division of the council of exceptional children, NEA; as past president of the Pennsylvania Association for the Study and the Education of Mentally Gifted; as immediate past president of the Department of Supervision and Curriculum of the Pennsylvania State Education Association.

II. The need

We are concerned about providing a more suitable education for these people known as the gifted. Essentially this involves the proper identification of the gifted, the preparation of teachers to work effectively with these capable young minds, the development of suitable learning materials, coordinated research into many as yet unresolved problems, the making available of information and help on a national scale.

Although one might make a case that having brains is a handicap, our chief concern is that we consider the gifted to be exceptional children for whom the regular program, regular material, and usual patterns of instruction are not

satisfactory.

Manpower studies indicate that the United States wastes much of its talent. For example, fewer than half of the upper 25 percent of all high school graduates ever earn college degrees. A very serious problem in many schools, is that people with high potential ability are not living up to their expectations; these are often known as underachievers. There are too many causes to enumerate here as to why we are not discovering and developing America's mind power, but basically the difficulty could be laid to the failure of our schools to provide

sufficiently challenging programs.

There are between 1,500,000 and 2 million gifted children in the United States. While there are some places where programs seem to be operating effectively, nevertheless, the National Man Power Council and the National Education Association estimate that at least 400,000 bright children each year are being denied a chance to develop their potential. The interests of this Nation are tied up with political and social leadership, with the need for effective communication, with people who can develop and promote a philosophic frontier which will guide our destinies. All this is in addition to the well recognized need for leaders in the field of science, mathematics, and foreign languages as indicated in the National Defense Education Act. This latter is a fine beginning step but it is not nearly enough. As Max Lerner has defined the problem, "Our crisis is the crisis of the inadequate use of the potentials of talent and leadership among our young people."

In short, we believe that our gifted are among the most neglected in the United States, and thus we propose the following recommendations for your con-

sidered study in providing adequate legislation at the national level.

III. Proposals

(a) Teacher education.—It is a truism that "the teacher makes a difference." However, rare indeed is the teacher who has had the opportunity to study the particular problems and procedures connected with education of the gifted. Just as the NDEA is providing background for elementary schoolteachers in the field of science; so must we make provisions for teachers in their inservice study to investigate ways and means of meeting the challenge of challenges of the gifted. Just as the National Science Foundation provides scholarships for teachers in the fields of mathematics and science, so must we provide scholarships for teachers to study educational needs of the gifted, in these as well as in many other areas of knowledge. Added to both of these points is the obvious need to recruit and educate teachers in these problems before their actual teaching days. This calls for a carefully developed plan of recruitment and grants-in-aid for the college preparation of such prospective teachers.

(b) Research.—An underlying need relates to the matter of getting extensive and coordinated research in many aspects. What kinds of people profit most from what kinds of administrative arrangements? How can we best identify the gifted? How can we motivate each so that he will live up to his potential? What are the attributes of originality, creativity, and critical thinking, and how can these be developed? What are the various kinds of leadership that our Nation needs and how can we provide suitable programs for these goals? How can we evaluate our efforts both through short-range and in long-range studies? Answers to these and similar questions call for a national, systematic research

endeavor.

(c) Matching funds.—A few States have already begun to encourage experimental programs as well as the improvement of existing plans by providing additional funds on a limited basis. It has been demonstrated that the suitable education for the gifted costs more than for the average pupil—but considerably less than it does to educate those in the handicapped category. Such efforts are not extensive enough in type, spread, or amount. Thus we recommend the development of a plan for matching funds at the national level to encourage activities within the various States, in behalf of the gifted.

(d) The U.S. Office of Education needs to be studied in terms of its function, its expansion of services and personnel so that it may more effectively give encouragement to State and local groups, that it may serve as a clearinghouse to disseminate information, that it may exercise a strong leadership role in the field

of the gifted.

(e) Extension of the NDEA.—The commendable work begun through the National Defense Education Act might serve to meet some of the needs of the gifted by extension in various ways. We recommend especially the extension of title V to include the elementary school. We believe that title III should be expanded to give consideration to various other kinds of leadership calling thus for help in the various fields of knowledge beyond mathematics, science, and foreign language—especially the humanities, the social studies, and the arts.

We realize that there is some controversy as to the extent at which education is a Federal responsibility. We do know that several studies have indicated a large majority of people of the United States are in favor of Federal aid to education. If it is of concern to us that moneys and other forms of aid be made available for the rehabilitation of the handicapped, certainly it is equally as important that the same principle be applied to those children and youth of our Nation who are gifted and who, given half a chance, should be providing various types of leadership for our Nation in the future. Such an outcome is dependent upon more money and more leadership than can be provided at the State and the local level.

We respectfully request that the Subcommittee on Special Education of the Committee on Education and Labor of the House of Representatives give serious consideration to the needs of the gifted and to the five suggestions which we have

made as to ways in which this critical national need can be met.

Thank you for providing us the opportunity to bring this problem to your attention.

Mr. Elliott. Our next witness is Dr. Marian R. Stanford, Department of Health, Trenton, N.J.

Paul R. Reed?

John Charlton?

Robert C. Thompson? Dr. Leon Charney?

Are you Mr. Thompson? Come around, Mr. Thompson.

Mr. Thompson is the director of vocational rehabilitation of the Department of Education, Baltimore, Md.

STATEMENT OF ROBERT C. THOMPSON, DIRECTOR, VOCATIONAL REHABILITATION, DEPARTMENT OF EDUCATION, BALTIMORE, MD.

Mr. Elliott. You may proceed, Mr. Thompson, for 10 minutes.

Mr. Thompson. Thank you, sir.

I did not bring a prepared statement. I would just like to make a few comments on behalf of vocational-rehabilitation directors.

We feel that this bill, H.R. 3465, is one of the most forward pieces of legislation, forward looking pieces of legislation that has been pre-

sented to the Congress in a long time.

It should fill a very great need in the program for the handicapped because under our present plan, as you know, many thousands of persons are so severely disabled at the time of contact that it is not foreseen as to what their occupational outcome may be, so by law we are not permitted to take them on as clients.

This bill, however, would make it possible for us to take on a great many thousands of persons since we would not have to predict voca-

tional success in the beginning.

Now, one of the things that has been disturbing us somewhat in the last 2 or 3 years is the finding of a large number of persons through the old-age and survivors insurance, disability-determination program, who do not seem to be eligible for vocational rehabilitation.

I believe only a small percentage of the folks who are referred to us for determination of disability have any vocational potential at all.

Mr. Elliott. In that field, it seems to me that we need to tighten up our law in terms of making it more workable under the determinations, and particularly those made up recently.

The requirements for social-security benefits for total and permanently disabled were so great, so massive, that I did not find anybody

who had ever qualified.

If you tried to rehabilitate all the people that were turned down for social security, you would have a problem on your hands.

Mr. Thompson. He certainly would.

There seems to be a little conflict there in the matter of definition. Now, we have, our rehabilitary agency has the determination responsibility, also.

Mr. Elliott. That just occurred recently; did it not?

Mr. Thompson. We started out in Maryland with the program. I think all but seven States have a disability vocational rehabilitation.

Mr. Elliott. In Alabama I believe that just occurred in the last

6 months or so.

Mr. Thompson. That is right.

Mr. Elliott. I believe that is right, but I will say that you have a difficult job measuring your examination, your determinations, as you call them, with the social security law, do you not?

Mr. Thompson. Yes, sir; because of the approach I think in determining what is a permanent disability. In the minds of the social

security positions it is complete inability to work.

Now, it is rather difficult in some cases to find persons that you can say are completely disabled, whereas on the other hand, in rehabilitation from the standpoint of the experience we have had, a severe disability is not always necessary to prevent the man from being employed.

A minor disability sometimes makes him unemployable. That is

where we have a little conflict.

It is being ironed out gradually because medical consultants in both areas are getting together and I think they have made a great deal of progress lately, but we are still concerned about the large number of people that we can't serve in rehabilitation.

Remember, when the law was passed, it was felt that the majority of them could receive services, but of the 5,000 that we see each year, to make disability determinations on, we get very few of them

into the regular rehabilitation mill.

Mr. Elliorr. How many do you figure that you rehabilitate, that could be rehabilitated for employment? Others have testified during these hearings that they felt they were only rehabilitating 1 out of 6.

Do you think that you are achieving a higher percentage than that

in your State?

Mr. Thompson. No, sir; not in ultimate rehabilitation. We serve probably that many, but I don't think we carry them through to successful placement.

Of course, you must remember in these early years of the program they had taken people, patients from mental hospitals and TB hospitals, and all those who had been severely disabled for many years and actually were unemployable.

When that group is cleared out the ones who come in the future will have more potential, but this law would it be possible for us to make, to give extensive evaluation services, to determine a possible vocational potential which we cannot do under the present law.

Mr. Quie. Do you have jurisdiction over the vocational training of any people? Do you only have jurisdiction over adults, or do you also have jurisdiction over the children in school of vocational reha-

bilitation or training?

Mr. Thompson. Our department of education has a special education service. It was affiliated with vocational rehabilitation up until 1942.

Mr. Quie. It is not any more?

Mr. Thompson. It is not, as such. The same personnel are not

there, but we have very close cooperation.

In fact, the school census law, which lists handicapped persons from birth to 21, has a provision whereby all of their findings are turned over to the rehabilitation council.

We also have two or three special counselors now who work only in the school. We make an effort to visit every school at least once a year and we register boys and girls who are disabled as soon as they begin to show a need for vocational guidance.

Now, we do not have any minimum age. It is approximately 16, but we may take persons under 16 if they are beginning to show a

concern about them.

Mr. Quie. Do you have any vocational schools, as such, or are they

all classes within the public schools?

Mr. Thompson. In the public schools, but not operated by vocational rehabilitation.

Mr. Quie. Do you have any schools that are strictly vocational

schools?

Mr. Thompson. Yes, sir; we have several. One of the finest in the world, I would say, is in Baltimore.

Mr. Quie. Can a person who is a slow learner enter that school,

or do you have to have a pretty good IQ?

Mr. Thompson. I don't believe they have an IQ provision. They have occupational schools in the city. The city of Baltimore Board of Education is separate and distinct from the State of Maryland, as you probably know. Baltimore City is one of the 24 political units. The other three being counties, so that it has its own school system.

Our program of vocational rehabilitation is probably the only educational program that is covered statewide. We use the schools, but we pay tuition for persons that come into it from outside the city of

Baltimore.

Mr. Elliott. Thank you very much.

Mr. Thompson. Thank you, Mr. Chairman.

Mr. Elliott. The subcommittee will adjourn now until 2:15. We will resume at 2:15 with the witnesses scheduled for this afternoon.

(Thereupon, at 12:35 p.m., the subcommittee was recessed, to reconvene at 2:15 p.m. same day.)

AFTERNOON SESSION

The subcommittee reconvened at 2:45 p.m., upon the expiration of the recess.

Mr. Elliott. Our genial host, Congressman Dominick Daniels, fed us so well this afternoon that we could not get back in time to meet our starting time, but we will get going now.

Our first witness is Dr. Marian Stanford.

Is Dr. Stanford here?

May I say to you now that we have 15 or 20 witnesses to hear this afternoon. We must limit our witnesses to 10 minutes.

With that understanding, you may proceed.

STATEMENT OF DR. MARIAN R. STANFORD, DEPARTMENT OF HEALTH, TRENTON, N.J.

Dr. Stanford. If you will give me a little signal, I will appreciate it.

I am director of the division of chronic illness, State department

of health.

It has been said that problems are only opportunities in work clothes. New Jersey has already put on its work clothes and is today working toward the solution of the problem of chronic illness.

In the spring of 1952 the prevention of chronic illness act became law. This act established within the State department of health a division of chronic illness control for the prevention, early detection, control, and rehabilitation of chronic sick of this State.

Now, I should like to have a copy of this law in the record, because

it is, I think, a very forward-looking law.

Written into this act is a declaration of public policy which states that:

The growing problem of prevention, detection, and care of chronic illness, which is of such character as not to be exclusively medical, educational, or welfare, has now reached such proportions in this State as to require the participation of the State and of the agencies administering public health, education, and welfare within the State and it is hereby declared to be the public policy of this State that the responsibility therefor must be shared by the State and the counties and several municipalities and health districts and the voluntary agencies and institutions within the State, and the public at large.

This amounts virtually to mandate from the citizens of the State through their elected representatives for a coordinated program of chronic illness control with the process of coordination operating both horizontally and vertically from the State to the local area.

The problem of chronic illness is so complex in nature, so diversified in need, and so widespread throughout all population groups that only through the combined efforts and the best efforts of all of us can we make any appreciable headway in promoting and emerging new concepts of health.

The health of the individual is no longer evaluated in relation to a disease entity, but in terms of physical fitness mentally, emotionally, and physical adjustment, as a means to a happier and more produc-

tive life.

The division programs are developed around the total person and

our emphasis on his capabilities rather than his disabilities.

The attainment of this higher standard of health requires the assistance of many different disciplines in a well-coordinated team approach, but the complexity of problems and the multiplicity of needs of the

chronically ill individual make it impossible for a physician to carry

the burden unaided.

Assistance has been given in the development of community hospitals as diagnostic and consultation centers to which the private physician may refer patients for the highly specialized techniques which are impractical or impossible to carry out in his office.

We have planned training programs for the physicians, provided equipment and grants for personnel in order to apply the new knowledge that is now available in the prevention of many chronic illnesses.

The family physician initiates the planning and participates in the evaluation process with the hospital team of professional and technical specialists which may today include physical and occupational therapists, hearing and speech therapists, physicists, and psychologists.

First, hearing and speech therapists, physicists, and psychologists. Grants-in-aid have been given to hospitals to build in these skills so essential to total patient care. We are proud that New Jersey has been a leader in this comprehensive approach and anticipatory

planning in the hospital.

The method of encouraging local agencies, usually community hospitals, to initiate programs by providing financial assistance through grants-in-aid contracts seems to be an effective way of gaining community interest.

The contract places responsibility on the operating agency at the onset for the operation of the program and clearly indicates that the

financial assistance given by the State is temporary.

Services far in excess of the actual expenditures of State funds have been provided for the people by this method of aiding agencies

already operating a service to the public.

To illustrate, the restorative service unit of the Essex County Hospital, Belleville, opened May 1, 1955, as a State-county pilot project to demonstrate that a health facility for which there has been a decreasing need as a contagious disease hospital, can be put to work as a disability reducing unit.

A study was made after 31 months of operation of this program and revealed that 103 of the 177 persons in this restorative unit who had been in this restorative unit who had been in this restorative unit

were still alive.

Fifty-three were in their own homes and none was in hospitals. There is a detailed study of this in a pamphlet which I have placed

over there which was prepared by Miss Audrey Ann Duffy, our State

consultant in medical rehabilitation.

I am going to skip some of the findings, but I would like to say that this study demonstrated that the cost of community placement after registration for these patients was only one-half as great as custodial care would have cost.

This study shows that there was a savings in that 31 months of \$600,000. And individuals were placed in a more homelike environ-

ment and that is essential for these patients to thrive.

We would like to see this kind of facility in every county.

Our greatest problem is that we cannot get the skilled personnel. They don't seem to exist. We anticipate the development of an outpatient service at the Belleville Hospital where these patients may return for periodic evaluation.

There, again, it is essential to have these facilities available so that the individuals can get from their home to the facility readily.

I would like to give you an example, if I have the time, of one or

two cases there.

A 51-year-old woman with a history of arthritis and periodic hospitalization for mental illness since 1937, was admitted for comprehensive evaluation in the restorative service unit at the Essex County Hospital. The final diagnosis was conversion hysteria. Her illness was not caused by disease, but by emotional problems.

Warmth and support services and a limited program of intensive therapy to demonstrate to the patient that she did not have arthritis, but had the muscle strength, resulted in stimulating her to really work

to get back on her feet and to return home.

She had received assistance from public sources since 1937 because she had been incapable of self-care of managing her own home.

Now, the patient is healthy, happy, and independent after only a

short period of hospitalization and restorative service unit.

Now, the second case I would like to tell you about and that about

winds it up.

The very, very first patient admitted to this restorative unit when it opened in 1955 was an 84-year-old widow, a stroke victim. She is still alive, she is still living alone, and all of the community supportive services she has needed has been a homemaker for a few hours a day.

She now needs only a chore boy to do some shopping and various

thing

All it costs for her to live alone was an adaptive device which cost \$15. She had 60 days of intensive restorative treatment in the unit.

Our greatest need is to apply the knowledge that we have today to prevent many of the complications that we are now seeing.

Our greatest need is more skilled personnel and a flexible program for training personnel. I believe we will have to recruit while the students are still deciding on their life careers.

I would like to close by quoting Leonard W. Mayo, chairman of

the National Commission on Chronic Illness:

Herein lies the problem and the challenge of chronic illness and disability. No one agency, no one profession, no one program can prevail. Nor can 50 national, or any number of local agencies, working separately, prevail. The prognosis calls clearly for the most extensive, complete, and effective unity of forces ever undertaken outside of war in our history.

Thank you.

Mr. Elliott. Thank you very much, Dr. Stanford. (The statement and pamphlet referred to follow:)

STATEMENT SUBMITTED BY DR. MARIAN R. STANFORD, DEPARTMENT OF HEALTH, TRENTON, N.J.

It has been said that problems are only opportunities in work clothes. New Jersey has already put on its work clothes and is today working toward the solution of the problem of chronic illness. In the spring of 1952, the Prevention of Chronic Illness Act became a law. This act established within the State department of health "a division of chronic illness control for the prevention, early detection, control, and rehabilitation of the chronic sick of this State." Written into this act is a "declaration of public policy" which states:

"The growing problem of prevention, detection, and care of chronic illness, which is of such character as not to be exclusively medical, education, or welfare, has now reached such proportions in this State as to require the participation of this State and the responsibility therefor must be shared by the State and the counties and the several municipalities and health districts and the voluntary agencies and institutions within the State and he public at large."

The law further provides that the division shall arrange for joint discussion of the general problem of the chronic sick with representatives of all official and voluntary agencies and professions for the "purpose of formulating an adequate program for dealing with the problem of the chronic sick, and to determine a formula for the ultimate division of the governmental share of

the cost thereof between municipalities, counties, and the State."

The division of chronic illness control has planned its program on the assumption that no one department, group, or organization can do the job alone. The problem of chronic illness control is so complex in nature, so diversified in need, and so widespread throughout all population groups, that only through the combined efforts-and the best efforts-of all of us can we make any appreciable headway in promoting an emerging new concept of health.

The health of an individual is no longer evaluated in relation to a disease entity, but in terms of physical fitness and mental, emotional, and social adjustment as a means to a happier and more productive life. In other words, our division programs are developed for the total person and our emphasis is on prevention of disability and/or the preservation of his capabilities rather than his disabilities. The attainment of this higher standard of health requires the assistance of many different disciplines in a well-coordinated team approach.

Let us keep in mind also that the development of official and voluntary health programs does not alter the fact that primarily it is the family physician upon whose shoulders rests the responsibility for the health of the individual and his family. But the complexity of problems and the multiplicity of needs of the chronically ill individual make it impossible for the physician to carry the

burden unaided.

Assistance has been given in the development of community hospitals as diagnostic and consultation centers to which the private physician may refer patients for the newer highly specialized techniques which are impractical or impossible for him to carry out in his office. It is only in physicians' offices and in community hospitals that essential services can be brought to the patient at the earliest possible time. The family physician initiates the treatment plan for the patient and usually participates in the evaluation process with the hospital team of professional and technical specialists which may today include hearing and speech, physical and occupational therapists, nurses, medical social workers, biochemists, physiologists, physicists, and cytologists. Grants-in-aid have been given to hospitals to build in these skills so essential to total patient This is prevention.

We are proud that New Jersey has been a leader in the promotion of the comprehensive approach to more positive health through anticipatory planning for the patient starting in the community hospital. It is only by anticipating complications which may arise with a particular illness, and taking steps to prevent such complications as soon as possible after the diagnosis is made, that people can be directed toward partial or complete self-help at the beginning of their trouble. If there are delays, people are robbed of that opportunity as

they lose more of their health or their initiative and self-reliance.

Through mass screening programs and selected screening of patients in hospitals, unsuspected disease or incipient disease can be brought to the attention of physicians and, again, their role is the key one in making the definitive diagnosis and providing adequate treatment, as early as possible to prevent unneces-

sary disability.

The method of encouraging local agencies, usually community hospitals, to initiate programs by providing financial assistance through grant-in-aid contract places responsibility on the operating agency at the onset for the operation of the program and clearly indicates that the financial assistance given by the State is temporary. Services far in excess of the actual expenditures of State funds have been provided for the people by this method of aiding agencies already operating a service to the public.

To illustrate, the restorative services unit at Essex County Hospital. Belleville, N.J., opened on May 1, 1955, as a State-county pilot project to demonstrate that a health facility, for which there has been a decreasing need as a contagions disease hospital, can be put to work as a disability reducing unit and/or prevention center. This project developed after months of joint planning by the division of chronic illness control staff and the Essex County Board of Chosen Freeholders in cooperation with the Essex County Welfare Board and the Essex County Welfare Board and the Essex County Welfare Board and to Essex County welfare Board and the Essex County Welfare Board and Essex County Welfare Boa

A recent evaluation of this program after 31 months of operation illustrated the degree of restoration attained in a group of 177 persons ranging from 27 to 94 years of age. The study revealed that 103 are still alive; 53 are living in their own homes, the remainder are in nursing or boarding homes, and none are in the hospital. The average length of stay in the Essex County Hospital was 58 days, ranging from a period of 8 days to 165 days. Following restoration and placement in a more homelike environment, documented cost per patient fell from \$800 to \$104 a month, with an average saving of \$196 per patient per month. The cost of community placement proved to be only one-half as much as custodial care for the same period of time, while return of the patient to his own home cut the cost to one-quarter of that required for custodial care.

A similar restorative services program is in operation at the Camden County Hospital where the county board of freeholders has taken over all financial responsibility for the team of skilled workers after 3 years of assistance from the division of chronic illness control. A program is developing in Trenton at the Donnelly Memorial Hospital, and a former alms house in Sussex County. This program will ultimately be expanded to a county level. Planning for similar programs in several other countries is underway. Patients thrive better in their familiar environment and where they can return to the hospital for periodic reevaluation with a minimum need for transportation.

INSTITUTIONALIZATION BECOMES UNNECESSARY

The first patient admitted to the Essex County Restorative Service unit in May 1955 was an \$4-year-old widow, a stroke victim, who is still alive. After 2 months of intensive restorative therapy she was discharged to her own home. Now, 5 years later she is still living in her home. An adaptive device costing \$15 enabled her to maintain herself in her own home on a public assistance grant of \$82 a month. Her only community supportive aid was a homemaker service for a few hours a day for awhile and now she needs only a chore boy occasionally. Continued custodial care for this period of time would have cost \$17,100 and she would still be helpless. Her actual living cost since discharge has been \$4,510.

A MAN LEARNS TO WALK AND TAKE CARE OF HIMSELF

A nonambulant, male patient age 40 years who had experienced hospitalization on and off since 1944 was referred to the restorative services unit at Camden County Hospital on October 18, 1957. During a series of treatments over a period of 1 year and 10 months, the patient's condition showed marked improvement, and so did his motivation to help himself. Under supervision he was able to learn to walk again and care for his own needs The time spent in the hospital as an inpatient was 14 years, 39 weeks, and 2 days at a cost of \$25,643.67.

A FAMILY REUNITED

A 51-year-old woman with a history of arthritis and periodic hospitalization for mental illness since 1937 was admitted for comprehensive evaluation to the restorative services unit at Essex County Hospital. The final diagnosis was "conversion hysteria." Her illness was not caused by disease but by emotional problem. Warm, supportive help and 37 occupational therapy treatments helped to motivate her to cooperate and to realize that she could perform all activities of daily living. This patient had received assistance from public sources since 1937 because she felt incapable of looking after herself and her home. Now she is healthy and happily independent after a period of only 5 months of participation in the restorative services program.

Much has been accomplished through our restorative service programs to give hope, better health, and more enjoyable living to those individuals who were at one time regarded incurable. Our greatest handicap is lack of skilled

personnel. We need training programs to prepare a greater number of skilled personnel and to train others who can work under their supervision. Recruitment for special training should be done while high school students are considering their life careers.

ARE RESTORATIVE SERVICES FOR THE AGED A GOOD INVESTMENT?

(By Adriane V. Duffy, M.S., fellow, American Public Health Association, program coordinator, public health social work program, New Jersey State Department of Health, in collaboration with Dr. Marguerite F. Hall, Ph.D., fellow, American Public Health Association, vice chairman, Public Health Research Project Design and Evaluation Committee, New Jersey State De-

partment of Health)

The preservation of priceless human values which can result from an intensive program of restorative services for aged chronically ill individuals has been dramatically demonstrated many times in regained human dignity and the ability to become self-sufficient. Because many local communities are not aware of the dollar value to be received for the dollar spent—believing these programs to be too expensive to develop and support—relatively few have been established. Expenditures of public or voluntary funds on bedridden individuals and long-term residents of nursing homes or other institutions, in what seems to many to be their nonproductive years of life, have been considered a poor investment, offering little or no economic return to the community.

GRANT-IN-AID METHOD INCENTIVE FOR COMMUNITIES

In New Jersey, the grant-in-aid method of State assistance has been a productive way of fostering the establishment of needed community services. Responsibility always rests with the local agency, and it is understood from the outset that the financial assistance from the State will be reduced on a year-by-year basis. The State Department of Health both lends expensive specialized equipment and also provides financial grants-in-aid to permit employment or training of specialized professional or technical personnel. In effect, the grantin-aid is an incentive or motivation acting as a catalyst in the community.

The restorative services unit of the Essex County Hospital, Belleville, opened on May 1, 1955, as a State-county pilot demonstration project. It was the result of months of joint planning by the division of chronic illness control of the New Jersey State Department of Health and the Essex County Board of Chosen Freeholders (the elected officials of the county government) in cooperation with the Essex County Welfare Board and the Essex County Medical Society.

Decrease in recent years in the incidence of communicable diseases for which the Essex County Hospital at Belleville had originally been built made available to the Essex County Welfare Board the first unit of 25 beds. The restorative services unit had its base in the new concept of the functional restoration of the aged chronically ill individual to his maximal functional capacity. Its goal was the development of the individual's capacity toward self-care rather than "vocationally directed" goals. This involved a variety of professional skills and supporting community resources, including the physical therapist, occupational therapist, medical social work coordinator, the liaison department of public welfare caseworker, and the public health nurse in the community. The medical social work coordinator was responsible for integrating the planning for the patient in the hospital and the community.

The medical advisory board of the hospital and of seven community hospitals both public and voluntary, offered services of their consultant medical

staffs on a 3-month rotating service.

TEAM ASSESSED PATIENT'S CAPACITIES

Admission to the hospital was based on an acute episode suffered by the patient, such as a fractured hip or other functional disability. Admission of patients to the restorative services unit followed team assessment of the patient's functional capacity and potential for restoration. Many of the patients had a long history of hospitalization, and most were bedfast or chairbound.

After 31 months of operation, the Essex County Board of Freeholders and the State department of health both requested that an evaluative study be made by the State consultant of the public health social work program, work-

ing in close cooperation with the Essex County Welfare Board, to assess whatever gains had been made by the patients admitted to the restorative services unit. The study period was limited from May 1, 1955, to January 1, 1958. Administrative channels were cleared and steps were taken to facilitate the study. By agreement with the county welfare board, the case records and audited financial statements were made available to the State consultant, in order to document total costs of patients in the study who had been admitted to the restorative services unit. The study was based on the tentative hypothesis that restorative services for the aged chronically ill patient both rewarded the patient and aided the community in dollars saved,

177 PATIENTS ADMITTED IN 31-MONTH PERIOD

During the 31-month period, 177 patients were admitted, including 128 who received old age assistance, 47 receiving disability assistance, and two in the

blind assistance category. Ages ranged from 27 to 93 years.

Identification data were secured from the admission register of the restorative services unit, the hospital chart furnished medical information, and the individual case record of the county welfare board was the source of detailed placement costs. All costs were entered from audited records. The unit in the study was the individual admission of a patient to the unit.

A preliminary sample of 20 admissions was completed for evaluative purposes. to assess information available. In conference with the public health statistician, a revised schedule was devised, dividing the history of the patient's placement into four phases; the preadmission phase, the hospitalization-restorative phase, the postrestorative phase, and the present status as of January 1, 1958. Using the revised schedule, an analysis of 188 admissions of the 177 patients was completed. Admission and discharge status was determined in conference with the restorative services team.

A series of conferences with the county welfare board caseworker assigned to the public assistance clients in the hospital was held to document all costs for preadmission, community placements, the Essex County Hospital period of hospitalization, including the restorative services period, and the cost of placement by type and length of stay in the community up to January 1, 1958, on a

case-by-case basis.

After the information on the 188 admissions was assembled, the public health statistician prepared instructions for coding the items on the schedule. Specific directions related to the seven time intervals related to cost as shown in the schedule were given for business machine processing. The interval for each patient was analyzed from the date of admission to the hospital to the cutoff date of the study or death of the patient.

HOSPITAL COSTS COMPARED WITH COMMUNITY PLACEMENT

When all data were collected and processed, all monthly rates were converted into common denominator per diem rates. The \$10 daily comprehensive rate charged at Essex County Hospital remained constant throughout the study and was the basis of comparison. Total costs of hospitalization, of restorative services unit, and of prosthetic aids were determined. The cost of individual community placement was calculated by type of placement and length of stay. The total cost for restoration of the patient in the hospital was then compared to the type and cost for community placement and the length of time the patient had survived in the community.

Of the 177 patients involved in the 188 admissions, 143 were still living: 45 had died during the time span of the study. There were 19 patients still under care in the unit and 156 had been discharged to a community placement. Of the 45 patients who died, 9 died in the hospital. The remaining 32 patients had a survival period ranging from 1 to 28 months. There were twice as many females as males admitted to the unit. Ten patients had more than one admission; nine

were admitted twice and one was admitted three times.

Excluding the patients who died either in the hospital or community, of the remaining 143 patients, 75.5 percent were bedfast on admission but only 2.8 percent were bedfast on discharge.

There were six major groups of disability. The largest, 38 percent resulted from cardiovascular disease, including "strokes"; 21 percent were admitted because of fractures; 20 percent were amputees, the majority of which were a result of diabetes; and the remainder were related to arthritis and neurological

disability.

As an illustration of a cost analysis of an admission, the following is offered: Sixty days of restorative therapy at a cost of \$10 a day to the county welfare department, plus \$90.50 for prosthetic devices (a total of \$690.50) enabled a 70-year-old "stroke" patient who was previously bedfast to return home. The cost of her maintenance since she returned to the community has been \$2.33 a day for the past 934 days. She was the first patient admitted to the unit. Since this patient is still alive and living in the community, the savings continue at the same rate each month.

SERVICES REFLECT LARGE ECONOMIES

Preliminary analysis has shown that the 177 persons admitted to the hospital spent approximately 879 patient-months under care at a total cost of \$263,700. Subsequent to their discharge, \$205,900 was spent for their care in various types of community placement. For restorative aids, such as canes, etc., \$4,850 was spent. The State invested \$22,000 in grant-in-aid funds during this period. If the 1,986 patient-months of care provided in community placement had been spent in the Essex County Hospital under custodial care, the cost would have approached \$600,000. The restorative services provided and community placement achieved resulted in a saving of approximately \$400,000. Documented costs per patient fell from \$300 a month to \$104 for an average saving of \$196 per patient per month.

However, this does not reflect the total hidden savings to the community in terms of the true hospital per diem cost, since the flat \$10 per diem is only about half the cost per patient bed. Since 22 percent were admitted from community hospitals, the costs for this group would be greater. In some cases, there was a time lag between hospital discharge and community placement due to limited community resources which, if available, would have further increased the amount saved. Following restorative therapy, 64 percent of the patients admit-

ted were cared for in a less expensive placement.

The findings in the study have stimulated community action in several areas. Time lag between discharge from the restorative services unit to community placement has been reduced through simplification of competitive bidding for prosthetic devices. An outpatient clinic is being established at this hospital, and a bus is to be purchased to transport patients to the unit for periodic reevaluation. The total caseload of 6,000 individuals receiving public assistance from the county welfare board is being reevaluated to discover potential candidates for restoration.

The challenge in this field of restorative services for the aged is that valid knowledge and medical techniques are now available. We do not have to wait for research to make new discoveries. Knowledge exists but it needs to be applied. What we need is the instrument which will make these services available to people. The pilot project in New Jersey, stimulated by the State's participation and based on a great community need, has proven that it is good economics and sound social planning to invest money and professional skills in the restoration of the disabled.

Mr. Elliott. I recognize now the gentleman from New Jersey, Mr. Daniels.

Mr. Daniels. Mr. Chairman, we are privileged to have with us this afternoon the mayor of one of our neighboring municipalities, the city of Bayonne, located in the 13th Congressional District, represented by my colleague, Cornelius Gallagher. I am privileged to present to you Mayor Brady, of Bayonne, N.J.

Mayor Brady. In view of the fact that a whole lot of people here

Mayor Brady. In view of the fact that a whole lot of people here are in long distances and they have had a difficult time traveling, Dr. Merity, superintendent of schools of Bayonne and Dr. Horgan, director of special education of Bayonne, would like to hand in their

reports for the record.

Mr. Daniel. Thank you very much.

I would like to say, supplementing my previous remarks, that Mayor Brady is the father-in-law of one of our distinguished

colleagues from the State of Connecticut, the Honorable John Monagan.

Mr. Elliott. I am happy to meet you.

Without objection the statements of the mayor and his associates will be made a part of the record at this point.

(The statements referred to follow:)

STATEMENT OF HON. ALFRED BRADY, MAYOR, BAYONNE, N.J.

The need for expanding our program in education to meet the requirements of our special education has been fully demonstrated. We all recognize it. Such a program requires continuous research. The cost of operating and improving such facilities as our research indicates will be a continuous and increasing expense.

The economy of our city and of most New Jersey districts is already being strained to meet the increasing costs of education which are now considered

normal

The problem is countrywide and worthy of the full consideration by the Federal Government. I hope that you gentlemen will recommend the following:

1. The expansion of the Federal research facilities in the field of special education.

Continuing guidance for the States resulting from the research results.
 The provision of sufficient Federal aid to enable the school districts all over the country to implement the research results.

STATEMENT BY DR. CORNELIUS M. HORGAN, DIRECTOR OF SPECIAL EDUCATION AND SCHOOL PSYCHOLOGIST, BAYONNE, N.J.

Please accept my heartfelt thanks for the privilege of appearing before your distinguished committee and discussing our problem of meeting the challenge of special education. Today, community leaders from our city are appearing to discuss local needs with you gentlemen who have the responsibility of solving

problems of broader scope and of deeper national impact.

Since the committee has heard and recorded testimony covering all aspects of special education and rehabilitation; and since the committee is well aware of the relative importance of research, training, therapy, service extensions, etc., we are limiting our presentation to suggesting how the governing body can aid us in solving a local problem. In appearing before your body and presenting our recommendation, it is hoped that constructive action may bring a solution to our situation and pave the way for other communities in our State in finding an answer to the paradox of extending special educational services and facilities in the face of shrinking sources of financial income.

Our superintendent of schools, Dr. Howard E. Merity, is appearing to stress the need for assistance in educational planning for a public-school population of over 8,500 pupils, in terms of the special education problem. National estimates of the extent of the problem of the handicapped would indicate that considerably more children are in need of specialized services than those presently enrolled in the classes for the mentally retarded, educable and trainable;

physically handicapped; and the homebound.

Our mayor, Hon. Alfred E. Brady, will indicate the influence of budgetary pressures on present and on projected educational planning. In the past, many of our special-education personnel were encouraged to qualify for certification in special education, when the board of education reimbursed them for tuition costs; and in addition, granted bonus-increments. In recent years, budget problems caused a curtailment of those and other inducements to teacher preparation and to the extension of any educational program for the handicapped.

On the other hand, State legislation has extended services not only for the physically handicapped and the mentally retarded, but also includes the socially maladjusted and the emotionally disturbed in the special-education format. Within the framework of the program of the State department of special education, child-study specialists and services have been introduced. These child-study services are an important and necessary element in any complete and comprehensive program that attempts to meet the needs of all children in the

educational scene-whether they are in the regular classroom population, or

actually participating in a special-education program.

After more than 25 years of experience working among the mentally handicapped and physically disabled, as a teached, supervisor, administrator, director, and school psychologist, and more than 10 years as an instructor in special education on the university level, I am firmly convinced that the only solution to our local problem, and to the problem of other adjacent communities, is by direct financial assistance from the Federal Government, with respect to two

specific areas: respectively, space needs and specially trained personnel.

It is recommended that your committee study the feasibility of extending financial assistance to our community for construction of a child-study and training center that will be designed and equipped to effect a complete program of diagnosis, therapy, counseling, and training of all types of deviates, and dis-Such a center would enable our community to meet the needs of the handicapped in an efficient, professional, and humane manner and, in addition,

meet the provisions of the State law with respect to special education.

Plans for such a center and the specific program included in the specially designed space have been the topic of many months of consideration by professionals, civic representatives, and my membership of our Parent-Teacher Association for Special Education. Committees have visited other community specialeducation facilities and plants in order to more efficiently plan for the future. Other witnesses scheduled to appear before this committee are concerned with this problem and they will indicate to the committee their ideas and suggestions to implement my recommendation.

I wish to thank the committee for the time extended to me to present this simple recommendation. It is hoped that the brevity of this report will not oversimplify the magnitude of this problem that I have lived with for over a quarter of a century. It is hoped that Federal assistance will enable us to adequately provide for suitable facilities for the handicapped in our community.

STATEMENT OF DR. HOWARD E. MERITY, SUPERINTENDENT, BAYONNE PUBLIC SCHOOLS, BAYONNE, N.J.

Honorable sirs, please be assured of my gratitude to the honorable members of the committee for this opportunity to express my convictions on our present situation in special education. I have the honor to be the superintendent of schools in a city of 77,000 (according to the 1950 census) maintaining 11 elementary schools and a comprehensive high school and educating 8,700 students.

Our Bayonne school system has been conducting classes in special education for about 40 years. In view of this accumulation of experience it would seem that we should have the situation well in hand. We have to admit that our perplexities in this important field of education have increased much faster than our solutions for them. In fact our situation has reached the crisis stage which makes it imperative that Federal funds be available. This is a problem faced by all superintendents today. It is not merely local or rural or urban. is common to all school systems, therefore national.

We have a very intense and acute awareness of what we lack. We have a very accurate and concrete knowledge of what we need. With our present financial means we cannot see our way clear to provide adequately and justly for all the boys and girls who should be benefited by this program. It is heartening and encouraging that the honorable members of this committee are giving us this opportunity for a public hearing on special education. In addition to what the specialists have already outlined for you as the necessities of this area of school

work I appreciate the privilege of pinpointing our own quandary.

All the current discussions on city and school budgets bring out the fact that it is practically impossible to raise additional funds for educational purposes under the present property tax system, however urgent these purposes may be. In Bayonne we are able to provide for the physically and mentally handicapped only to a very limited extent. I am not very happy in stating to you that our present special education classes alleviate the anxieties and worries of too few parents of too few handicapped children. For every such child that we are able to take care of in our setup there are several more scattered through regular classrooms which are unsuitable for them. For the most part we can provide only for the more severe cases. Too often the selection of transfer has been affected by extreme behavior problems or extreme physical defects, rather than a

well-planned, well-implemented, complete transfer of all who need a training matched to limited abilities. Hence many such children are right now being deprived of the type of training that is suitable for them. I am actually compelled to hold down the enrollment in our special education classes in conformity with the number of teachers and classroom facilities that we can afford under our current budgets. The Beadleston legislation in New Jersey is founded on noble objectives and a comprehensive viewpoint, but we must frankly confess that we do not have the resources to carry out its wise and just provisions.

We are all aware that teachers for these special education groups must be well selected and well trained for their important work. We have never expected the regular classroom teacher to be equipped to cope with the problems of the special class. Back over the years we have offered special inducements to selected regular teachers to enter special education by such means as extra salary increments, reimbursement for courses taken, etc. Unfortunately, we even had to eliminate these. And even if we had the money for the salaries of the additional teachers needed, we would still be limited by lack of space in our present special education facilities.

Therefore, I am one of a multitude of superintendents who find ourselves between two milestones. On the one side is the reasonable and professional pressure exerted upon us by teachers and principals to provide for all the children who need special education. On the other side is the concrete reality that sufficient funds are not available. Our teaching faculty and our parents are unanimous in acknowledging and deploring our limitations in special education provisions in Bayonne and are cognizant of the economic limitations causing

this.

This is a brief summary of the reasons why I consider it a privilege to appear before the honorable committee, and why I earnestly recommend Federal participation in these programs designed for our physically and mentally handicapped boys and girls in Bayonne and especially for those whom we have not yet been able to bring into the benefits of the special educational program.

Mr. Elliott. Thank you very much.

Are there any other people from Bayonne?

Is Joseph Bagley here?

We will hear your testimony now, sir. Mr. Bagley, you may proceed, subject to our limitation of 10 minutes.

STATEMENT OF JOSEPH BAGLEY, CHAIRMAN, KIWANIS SPECIAL EDUCATION COMMITTEE, BAYONNE, N.J.

Mr. Bagley. Gentlemen, I am not an educator. I am a member of a

special education committee of the Bayonne Kiwanis Club.

This committee has been active on and off for the past 7 years in the field of special education. In the past 12 months the committee members have spent 50 man-days and have traveled some 2,200 miles.

We have visited the Halloran School in Elizabeth and the junior school in Camden. We have talked with parents, teachers, principals, and superintendents whenever possible.

We established a need for special education through the good offices

of Dr. Merity and his principals.

Dr. Boyd Nelson, director of special education in this State aided in developing a plan for the educable and the trainable in Bayonne

School District.

Dr. Westby, head of school construction in this State, assigned Dr. Spare one of Dr. Westby's assistants in school construction to determine the space needed for 25 classes of educable, trainable, physically handicapped, socially maladjusted, and educationally malajusted

Dr. Spare and Dr. Boyd Nelson took care of the problem of the space requirements as demanded by the laws of the State of New Jersey; 60,000 square feet of school space with the facilities that go with type of project is needed. This is the actual space needed for minimum requirements in the Bayonne School District.

Approximate cost of building and facilities, \$1,500,000. Bayonne like many communities in the country needs Federal aid and State aid

to maintain a high level of learning.

The magnitude of the growing workload in the field of special education is such that a pilot plant will have to be set up as a pattern for others to follow in the State and in the Nation.

It is the Bayonne Kiwanis Club's hope that you gentlemen will see

to it that our dream of a pilot plant for Bayonne will be realized.

These sketches are not drawn to scale, but the estimated footage is quite accurate.

Mr. Elliott. Thank you very much, sir.

I recognize the gentleman from Minnesota, Mr. Quie.

Mr. Quie. Have you gone before the State legisature to give them the views of Kiwanis of what you ought to do to promote more aid

for special education in schools?

Mr. Bagley. No, sir. What we did do was to work in a way that Dr. Nelson, who heads special education in the State; Dr. Chase, who is the county supervisor of education, and Dr. Meridy, who is the superintendent of the school district—we kept in line with each other in the sense that any changes made in this plan that we have developed with the aid of all these men just so it would be mutually agreeable all around.

We have not as yet presented it to anybody other than you people.

Mr. Elliott. Thank you very much for your testimony.

Mr. Daniels. Our next witness is Mr. Harry R. Bloom, of Bayonne. Mr. Bloom, you are familiar with the rules of the committee that because of the large number of witnesses who have asked to appear here today to testify, we must limit the testimony of the witnesses to a period of 10 minutes?

STATEMENT OF HARRY R. BLOOM, BAYONNE, N.J.

Mr. Bloom. Mr. Congressman, I am familiar with your rules. May I say this, I think that all of you deserve a vote of thanks for coming into our area to listen to the problems that are being presented

to you.

As to Mr. Quie, of Minnesota, I address this remark: I think he should be very proud because the National Association for Retarded Children was organized in Minnesota 10 years ago in Minneapolis, and I was there as one of the organizers. This was a group that was formed by parents and not by professional people.

I speak here as a parent and as one who has been interested in this problem for a period of possibly 15 to 20 years. It is gratifying

to know that the problem at last is coming to the front.

It is gratifying to know that at last the problem, which is one of the great problems in education in the country, is being recognized for what it is.

I am a layman. I am an attorney, and I do not speak with the authority and case reports that some of the people who are present here and who spoke to you yesterday, have. I speak as one who

has seen this problem and who over a period of years has found that there are many lacks and there are many paper projects which in

reality never function.

There are problems of trained personnel, and without trained personnel the number of buildings and bricks and mortar that you might furnish in a very simple manner by making an appropriation, will not fulfill the problem. The problem is one of training personnel so that there will be a group of people to take care of the problem when it is present, as it is.

There are needs for buildings. There are needs for workshops. There is a crying need for trained personnel, teachers, and others, who can meet the need, the challenge, for the training of these retarded

children and those who are mentally handicapped.

It is simple to say, "Why not become a teacher for the mentally retarded?" This in itself is not an answer. The problem is one of assistance to those who are interested in the problem because, frankly, it is a job which in many instances is challenging and tiring job as all of us do, we seek to do the easiest thing rather than the most difficult thing.

So that if it becomes necessary to help them with grants so that they can take special courses and so forth this kind of problem must

be worked out.

The burden on the families might be relieved by certain tax concessions so that the families will be able to take care of their own in a much more efficient, possibly, and cheaper way, than in merely seeking large institutions for the purpose of institutionalizing and so on.

There is a problem of recreational facilities. There is a problem of training these retarded, mentally handicapped people to do the things that they are capable of doing and making their own contribution within their own ability in the civilization in which we live.

These, in many instances, are the forgotten children, but thank God for a committee such as this, and thank God for the action which has been taken over the past 10 years. They are not being forgotten now.

There are problems of psychological and psychiatric assistance. In many school systems we do not have adequate facilities because, unfortunately, they are bogged down with the budgetary problems of the normal. There isn't enough money, as we all know, in some of the budgets, and this is the cry, to even take care of the students who are actually there.

There is this constant attempt to cut down. When you are in the field of special education where 1 teacher will take care of 10 pupils, this throws the ratio, which on paper does not look good—it throws it out. So that this might be costing the system more than one who

could be teaching 30 children.

These are the practical problems that parents face and the practical problems the taxpayers face in trying to get this kind of problem right at the ground roots level, where it belongs in the school system,

in the home, in the assistance that is required in this area.

Many of these children come from parents of limited circumstances. These are the parents that sometimes might need tax relief if they were to provide medical attention rather than send the child to an institution where the same medical attention might cost a great deal

of money and, certainly would not be as concentrated and as impor-

tant as under the parental supervision.

I want to again thank you gentlemen for listening to the stories that you heard yesterday. Much of it is technical. I feel privileged as a parent and who is interested to appear before you. I feel that I speak for thousands of parents who might not be as vocal as I am and I say that the problem is one of great severity. It is a problem that must be faced as a practical one.

When I say as a practical one, if it is faced in its inception with a view toward a preventive approach, it may in the long run save many

taxpayer dollars in the future.

Thank you for the opportunity of speaking to you, gentlemen.

Mr. Daniels. On behalf of the committee, Mr. Bloom, I want to express our thanks for the sentiments which you have expressed here today.

Mr. Bloom. Thank you.

Mr. Daniels. Now our next witness will be Mr. Szymanski, of the Jersey City Board of Education.

Mr. Szymanski, you may proceed.

STATEMENT OF EDMUND SZYMANSKI, VICE PRESIDENT, BOARD OF EDUCATION OF JERSEY CITY, N.J.

Mr. Szymanski. I want to apologize also because of the shortness of time, gentlemen. I have a prepared text here which I prepared regarding my viewpoint as a layman, as a businessman, in Jersey City, and also as a vice president of our local board of education.

There is one thing I do want to add, which is not in this text, and that is the fact that some 30 years ago the city fathers at that time

saw this situation developing.

Lo and behold, they saw fit to organize one of our local schools, which is the A. Harry Moore School, named after our only three-time Governor of New Jersey, for this type of work to bring the children back to civilization and to a good civic life.

We have at the present time around 300 children attending this school. We draw on the entire county. It is all financed by the city

of Jersey City through the board of education.

At this time, if it is all possible, I mentioned to Congressman Daniels some time ago, I would love to have the committee take a

tour of this school and see what Jersey City has done.

Furthermore, at the Jersey City College across the street from this institution we have two classes now under the direction of Dr. Gilligan, who are following this type of vocation and they are being trained to take care of the physically handicapped, both mental and physical children, and adults, that may be in Jersey City and in the vicinity.

Other than that, gentlemen, I don't have much to say.

I believe our president was before you yesterday. He outlined his points of view and I think Miss Thompson is going to speak here today, if I am not mistaken.

Mr. Daniels. She appeared this morning.

Mr. Szymanski. She is our principal down there. I think through her, being that she is one of the professionals or the educators of this institution, she probably outlined that end of it.

Also, in Jersey City we have what we call a special service branch under the direction of Mr. Vincent O'Shea, who takes in the juvenile

delinquents as we call them.

We do have plenty of those problems in Jersey City and I think a lot of it is attributed to a lot of the parents who are lacking in funds and in seeing that these children when they start out, who do not

have the proper IQ, get the proper education.

I just returned from the Atlantic City AASA convention. I had the honor of listening to Mr. Eric Johnston, who was pinch-hitting for Senator Symington Tuesday night, outline the fact that the Federal Government only donates 4 percent of the total cost of education throughout the entire country. The city bears more than 50 percent, the State about 40 percent, and the balance, which is only 4 percent. is donated by the Federal Government.

I think it is about time that we did have some remuneration from the Federal Government to help offset our expenses here and keep

our tax rates down.

Thank you, gentlemen.

Mr. Daniels. Are there any questions of the gentleman?

Mr. Quie. I wondered how he was going to keep his tax rate down

by getting the money from the Federal Government.

Mr. Szymanski. It will certainly keep our cost down as far as our taxpayers go, if we do get some funds to offset some of the special

Mr. Quie. We will be returning to Jersey City the same tax money

Mr. Daniels. Without objection, the text of Mr. Szymanski's statement will be incorporated in the record following your oral testimony.

Mr. Szymanski. Thank you for allowing me to appear.

(The statement referred to follows:)

STATEMENT OF EDMUND SZYMANSKI, VICE PRESIDENT, BOARD OF EDUCATION, JERSEY CITY, N.J.

I appear today before your honorable committee in a dual capacity-first, as a citizen and businessman actively interested in any measures or procedures that will benefit his community and the Nation, and, second, as vice president of the Board of Education of Jersey City. In the latter capacity, I am particularly interested in matters pertaining to the education and welfare of the children of today who, as citizens of tomorrow, will have entrusted to them the destiny of the United States.

For generations, the education of our children has been a major concern of the leaders of our Nation. This has long been a proud and important part of the American heritage and has served as an inspiration and guide to

the other nations of the world.

Gradually, the scope of American education was expanded to include facilities for the education and training of children needing special consideration and help and for the preparation of teachers for work in the important field of special education. It came to be recognized that society has an obligation not alone to the so-called normal child, but also to the child who unfortunately possesses disabilities of one type or another and who, therefore, needs specialized educational facilities and assistance by a corps of teachers particularly trained in the field of the existing disability.

The provisions of educational opportunities for children who need special help and training is a highly commendable effort from a moral and humanitarian standpoint, but it also represents a most realistic and practical approach. The Nation is, indeed, benefited and strengthened whenever steps are taken toward developing to the maximum the individual capabilities of each of its citizens.

There is another practical consideration that enters into an appraisal of the importance of special education. Some of the causes of juvenile delinquency are firmly rooted in the sense of failure that results when a child is faced each day with school tasks that are beyond his ability to perform. This sense of failure frequently leads to a feeling of hopeless frustration which, I need not stress, is highly destructive from a psychological standpoint. The next step, beyond failure and frustration, is very often a feeling of bitterness and resentment, leading easily to the development of antisocial attitudes and the commission of antisocial acts.

The answer to this challenge lies in the provision of special education programs of such richness and scope that the child will be able to achieve success in his school tasks. From this success will inevitably arise feelings of accom-

plishment and success and a sense of really belonging.

Surely, these beneficial effects, plus the education and training that he receives from a special program geared to his individual limitations and needs, will make him a more effective citizen of our democracy at a time when such citizenship is particularly needed in view of the disturbed situations existing

throughout the world.

One may be sure that many States and communities which recognize the compelling need for special instruction and training for both children and adults who are in need of it are, nevertheless, prevented by financial considerations from establishing appropriate programs. They recognize that it is in the interest of society and of the Nation that assistance be rendered to handicapped individuals in the fields of special education and rehabilitation, but because of lack of funds they are unable to provide such assistance.

The Committee on Elucation and Labor of the United States House of Representatives is greatly to be applauded for its recognition of the problems that exist in the fields of special education and rehabilitation and for its intensive study of the role that the Federal Government can take in assisting local communities

toward a solution of those problems.

As regards H.R. 3465 (independent living bill) and House Joint Resolution 494 (a bill to provide for training of teachers of the deaf and speech pathologists and audiologists), as well as H.R. 1119 (to provide evaluation of rehabilitation potentials and rehabilitation services to handicapped individuals) and House Joint Resolution 316 (to encourage the expansion of teaching in the fields of speech and hearing), it is my opinion that favorable action would greatly assist the communities in certain aspects of special education and rehabilitation.

Mr. Daniels. Our next witness is R. H. McDonough, director of the Division of State Library, Archives, and History, New Jersey State Department of Education.

STATEMENT OF ROGER H. McDONOUGH, DIRECTOR, NEW JERSEY STATE LIBRARY; MEMBER, EXECUTIVE BOARD, AMERICAN LIBRARY ASSOCIATION

Mr. McDonough. My name is Roger McDonough. I am director of the Division of the State Library, Archives, and History, of the New

Jersev State Department of Education.

I am here today in my capacity as a member of the executive board of the American Library Association, a nonprofit, professional association of more than 23,000 members, consisting of librarians, trustees, and friends of libraries interested in the development, extension, and improvement of libraries as essential factors in the educational, social, and cultural aspects of society.

The American Library Association is keenly interested in the sub-

committee's study of educational services to the gifted child.

Our deep concern in this matter is reflected in the number of articles

on the subject to be found in library periodicals.

It is also evidenced in the increasing attention school administrators and librarians are giving to the problem of making certain that children in elementary and high school are surrounded with books that can enrich their regular courses and hold open to the gifted and intellectually curious child the means to explore new fields for himself.

A recent issue of the official publication of our organization, the ALA Bulletin—American Library Association, ALA Bulletin, February 1958, volume 52, No. 2—was devoted to the subject, "The School

Library and the Gifted Child."

I would like to quote from the foreward to this special issue, which was written by Mrs. Lillian L. Batchelor, supervisor of secondary school libraries for the Philadelphia Board of Education.

Mrs. Batchelor is past president of the American Association of

School Librarians, a division of American Library Association:

No problem is of greater national concern today than the education of the gifted. Recent events have served to focus wide attention on the subject, although leading educators have long stressed its importance to all of us. Now, for the first time in many years, the identification, development, and utilization of our greatest national resource, human talent, is being recognized as a priority item in education.

The library is in a strategic position to enrich the curriculum and to render unique service to the school. Good library facilities are generally considered

indispensable to the creative teacher working with bright children * * *.

It is hoped the material in this issue will prompt more librarians to plan for their gifted students, for no work is more needed—or more satisfying. Books are truly "the gunpowder of the mind," and librarians should know how to use them to fire the imagination and ambition of bright young people.

In Essex County, N.J., the local superintendents of schools and the librarians of the public and school libraries, have formed a study group to survey existing library facilities for the purpose of determining how their services to the gifted and exceptional child may

be improved.

This action stems from doubts about the adequacy of present facilities. If Essex County, with its splendid Newark library and many fine suburban public and high school libraries, is not able to meet all the demands made upon it at the present time, one wonders what the rest of the State is able to do with much less in the way of library resources to draw upon.

I have said that librarians are deeply concerned about this matter, but I would like to emphasize that our concern and interest is

not of recent origin.

Providing good books to every American who wants to read them for his self-education and development is at the very root and core of our American library philosophy.

Benjamin Franklin founded the first American library in 1731 in order that everyone in Philadelphia would have the opportunity for

self-education.

Over the years, countless numbers of Americans have been assisted by librarians who, as educators in the best sense of that term, have led willing and avid readers along intellectual paths of their own choosing, allowing each to reach his respective goal as quickly as his mental abilities would allow.

The fact that librarians in former years did not call their gifted readers by that term does not alter the fact that libraries have been

giving special attention to these people for a very long time.

To turn now to the subject of library service to the handicapped, I think you will be interested to know that one of the very active groups within the American Library Association is the Association of Hospital and Institution Libraries.

This organization represents libraries which serve patients, medical, nursing, and other professional staffs in hospitals and inmates or

residents and professional staffs in institutions.

These libraries are an integral part of the care program provided

by hospitals and institutions.

It is interesting to note that the AHIL has submitted to the National Institute of Mental Health for its consideration a proposal in the field of bibliotherapy entitled "Reading: Its Role in Rehabili-

tating the Mental Ill."

If funds are granted, a group of experts will meet at the Veterans' Administration hospital in Topeka, Kans., for an intensive work session covering current research, knowledge, and insight on the successful use of reading as a tool in the group treatment of the mental-

It may be noted also that a number of publications useful in the field are available at American Library Association headquarters and

include the following:

1. "Hospital Libraries: Objectives and Standards, 1953."

2. "Selected Readings in Hospital and Institution Libraries, 1959."

3. "Reading Aids for the Handicapped, 1959."

4. "New Horizons: Readable Books About the Physically Handicapped, 1951-56."

I have a copy of "Reading Aids for the Handicapped, 1959," with me this afternoon and I am happy to leave it with the committee. Mr. McDonough. If the committee will pardon another reference

to New Jersey, I would like to invite your attention to the State li-

brary's work with the department of institutions and agencies.

In an effort to assist this department in improving its services to penal, correctional, and mental institutions, we developed some years ago a matching book plan, whereby our bureau of public and school library services gives special book service to the 21 State institutions.

In addition, the bureau offers consultative and advisory services to the educational directors of all institutions involved, conducts workshops, and, in general, cooperates on a continuing basis with

officials of the department.

I have brought with me a pamphlet that describes this matching book plan service, together with a letter from Mr. Donald Goff, expressing the appreciation of the department for this cooperative venture in improving library services to State institutions.

I am sure that similar service is being given in many other States, but this one example will serve to indicate the library profession's

interest in this subject.

All the public libraries in Hudson County have banded together

to provide prison library service in county facilities here.

I could not conclude my remarks this afternoon without reminding the committee that the Library Service Act, while it was designed primarily to assist rural libraries and was not specifically aimed at either the gifted or the handicapped, has been a new source of

strength in serving both.

The act has made possible for the first time rural library service to millions of Americans. In New Jersey we have devoted a large part of the fund available to setting up a three-county regional library in the southern rural part of our State.

To mention just a couple quick examples of how this service has helped handicapped people, one retarded boy who suffered from a brain injury has used the bookmobile over a continuing period. He was reading at a very low level; he is only at a 7-year level instead of 12, but the reading of good books has helped him considerably.

In another instance a woman housebound with arthritis receives biweekly groups of books that are especially selected for her by the

bookmobile librarians.

In another instance, a gifted youngster whose teacher felt he could be helped by a good plan of reading, is now changed from reading well below his level of ability through systematic work with the librarian to a point where he is now on his way to reaching his full intellectual potential.

In conclusion I would like to say that the American Library Association heartily supports the study program undertaken by the sub-

committee.

We trust that you will not lose sight of the rural libraries, the role the rural libraries can play in assisting both the gifted and the handicapped throughout the Nation.

The association stands ready to assist the committee in any way

it can in pursuit of your worthy objectives.

Mr. Chairman and members of the subcommittee, I am deeply grateful for the opportunity to appear here this afternoon.

Mr. Daniels. Does the State library furnish any services for our blind or are you entirely dependent on the Library of Congress?

Mr. McDonough. We are dependent on the Library of Congress through the Philadelphia Library.

Mr. Daniels. Does the State of New Jersey make any contribution

for the printing of braille books for the blind?

Mr. McDonough. Unless it is done through the commission of the blind in Newark, I could not say. I do not know, Mr. Daniels, that we are not contributing to the Philadelphia free library for the regional library service it provides to the New Jersey blind readers.

Mr. Daniels. Are there any questions?

I gather that there is only repository for the Library of Congress for braille books in New Jersey is in Philadelphia?

Mr. McDonough. Yes, it is on a regional basis.

Mr. Quie. Do the machines come from Philadelphia or do you handle that?

Mr. McDonough. This is worked out between the Philadelphia free public library and the State commission for the blind.

Mr. Daniels. Thank you very much for your testimony, Mr. Mc-Donough.

Mr. McDonough. Thank you.

Mr. Daniels. I would like to acknowledge the presence in the audience of Mr. William J. Roehrenbeck, director of the Jersey City Library.

Mr. Daniels. Our next witness will be Mr. Paul R. Reed, chairman of the Legislative Committee, Pennsylvania Association for Retarded Children.

STATEMENT OF PAUL R. REED, SECOND VICE PRESIDENT, PENN-SYLVANIA ASSOCIATION FOR RETARDED CHILDREN, INC.

Mr. Reed. Mr. Chairman, I am deeply appreciative of the opportunity to appear for my organization, the Pennsylvania Association for Retarded Children, and to present testimony to this committee on

special education and rehabilitation.

These issues are central to the purpose of our association. We appreciate the work which your committee has done in the past toward the extension of these services and look to you for a continuation of the interest and energy which has brought to Pennsylvania the beginnings of sorely needed programs and services.

Our association is made up of 42 chapters throughout the State comprising some 5,500 members. I know that you and the members of this committee are aware that the principle reason for the formation of our association some 10 years ago was the lack of those very

services to which you are now addressing yourselves.

I will not take the time to outline in detail the present level of special education and rehabilitation programs in this State; we are submitting an attachment to this statement which describes in some detail the diffusion and scattering of services among five departments of the Commonwealth and which makes recommendations for a 10-year plan calling for the rationalization and phased achievement of seriously needed services.

In addition, we are submitting some brief tabulations showing the number of mentally retarded individuals now served in special education classes, indicating, also, the percentage estimated to be in need of these services but not now receiving them. I will want to refer to

these tabulations somewhat later in these brief remarks.

It is our contention that the services to the mental retardate should comprise a logical continuum of services starting with the extremely important early diagnoses and evaluation and proceeding from this to counseling with parents on the future of the child, to services in the home to be provided by visiting teachers and by public health nurses, to health programs designed to bring to the optimum the overall health of the child; the provision of preschool programs, classes for school-age mental retardates, with emphasis in later years on prevocational preparation and vocational training.

In this continuum of services there must also be provision for occupational training, sheltered employment, and recreational facilities

geared to the need of the retardate.

The institution or residence home, given the services which are needed in the local community, then becomes a specific instrument with specific purposes for specific individuals whose needs cannot be met in the community or who need the particular and especial services of the residence home at one or another period in their lives.

In no part of the State are services provided on anything approaching so comprehensive or logical a basis. Fully 23 percent of the mental retardates who might profit by training in classes for the "train-

able" child are not now in such classes.

Of the educable group (those, generally speaking, with intelligence quotients above 50 and below 75) 29 percent in the elementary age group are not receiving specialized education, and 52 percent in the

secondary age group are not receiving specialized education.

As is pointed out in the attached statement recently presented by our association to the Governor's Committee on Handicapped Children, headquarters staff in the department of public instruction is inadequate in number to give to the school districts now providing these classes the kind of leadership and assistance required and is for the same reason completely unable to do the job of taking the initiative and leadership in developing needed classes where they do not now exist.

The bureau of vocational rehabilitation gave services in the past fiscal year to 811 mental retardates, of whom 247 were placed in "satisfactory employment" at an average cost of \$346.79 per case, placed. During the current fiscal year, 521 mental retardates have been served to date by the bureau in 26 sheltered workshops as against 24 for the previous year. No figures are available on the actual numbers trained by the bureau of vocational rehabilitation in sheltered workshops.

I would like to say that we have no accurate estimate of the numbers requiring educational and training services in the schools nor the numbers who might profit from the training programs of the bureau of

vocational rehabilitation in sheltered workshops.

We do know from direct experience in a number of areas of the inadequacies of the census taken by the local school districts, and, so far as we know, no attempt has been made to gather information on the numbers who might profit from a well-established program of case finding, family counseling, and evaluation leading toward programs of training, placement, on-the-job counseling, and sheltered employment.

One new aspect of the program in Pennsylvania warrants your consideration; that is the program recently undertaken by the department of public welfare to provide in sheltered workshops long-term sheltered employment for mental retardates no longer served by the public school systems and declared ineligible for service by the bureau of vocational rehabilitation.

In this description I will be able to touch only briefly on the role of the State schools and hospitals for the mentally retarded. Of the 10,000 now in residence, many need not have been placed there in years past had the range of services described above been available even in

part.

In recent years the proportion of the severely retarded entering the institutions has increased sharply as local services (primarily classes for trainable individuals, and sheltered workshops) have become available. The point I wish to make in relation to the institutions is that there has been a lamentable lack of relationship between the existing and developing services of special education and rehabilitation and the institutions.

Mr. Chairman, I would like to turn now to some specific suggestions

for the consideration of your committee.

1. As a result of programs and projects established through appropriations under the Department of Health, Education, and Welfare, experience is developing on the structure and specific provision of

services. I would urge that a major recommendation of this committee be that the appropriate agencies of the Department of Health, Education, and Welfare provide active encouragement and assistance to the State of Pennsylvania in the planning and establishment of a logical structure of services. This would include assistance in the establishment of needed diagnostic and evaluation clinics (over and above those now operating) in the extension of maternal and child health services, in the inclusion in all services of adequate reporting and research activities.

2. A second suggestion I would like to make is that none of the needed services can be provided adequately without an absolute increase in trained personnel in all the agencies giving service to the

mentally retarded.

Counseling and stimulation are needed in providing sufficient headquarters staff for inservice training and means must be found for sharply increasing the number of teachers trained in the field of

special education.

As services to the mental retardate provided by the bureau of rehabilitation increase, the need for standards of training for those working in this field becomes more apparent. I would urge that the Office of Vocational Rehabilitation take positive initiative in extending its services in the upgrading of personnel which is required.

The values which inhere to the retardate, to his family, and to the community at large from the provision of effective training require more for their achievement than space and equipment; they can only be made truly available through skills which can be taught to qualified personnel. Still another area in which there is a need for training of personnel is in the counseling services which give meaning to the results of a diagnosis. Effective and meaningful interpretation to parents can serve to mobilize the strength of parents on the side of those helping to provide special services to the mental retardate.

I have emphasized the importance of a rational plan, the importance of a coordination of services. One of the most pressing of these needs is that of cooperative work between the bureau of vocational rehabilitation and the training programs in the secondary school programs for the mentally retarded. Here, too, I believe that the appropriate agencies within HEW can and must give effective leadership.

If the purpose of these special services is to make it possible for the retardate to participate, wherever possible, in the life of his community to the full, then the whole structure can fall if adequate community living and recreational facilities are not provided. It is in this area that the least progress has been made, and I would also urge that your committee consider methods of providing to the States guidance and leadership in the development of programs.

I would like to conclude my remarks with a statement of full support for H.R. 3465, the independent living bill, which you, Mr. Elliott, have

introduced in the House of Representatives.

Those of us who have been faced for many years with the direct responsibility for the care of a severely handicapped child know in our bones what the kind of help proposed in this bill would have meant and can now mean. We believe that the limited services toward these ends which we have been forced to initiate and support in recent years, have demonstrated the results which can be achieved.

through the application of skill and understanding to the training of

the severely mentally retarded.

We know, too, that the sheltered workshops in Pennsylvania reach only a small percentage of those who could profit from the training and sheltered employment which would be provided by the increased

numbers of sheltered workshops envisaged in this bill.

Mr. Chairman, in conclusion I wish to take note of one statement in the finding of fact and declaration in II.R. 3465, that which calls attention to the fact that the provision of independent living rehabilitation services would contribute greatly to the dignty and self-respect of the severely handicapped person. It is toward this deeply human objective that we in the Pennsylvania Association for Retarded Children have striven, and it is with deep appreciation that I note that this, too, is your motivation and that of your committee.

(The material referred to follows:)

EXHIBIT 1

STATEMENT ON PROGRAM NEEDS OF THE MENTALLY RETARDED

I. CURRENT AND FUTURE NEEDS OF THE MENTALLY RETARDED IN PENNSYLVANIA

An inclusive program for the mentally retarded would include:

1. Early identification.

- ${\bf 2}.$ Diagnosis and evaluation by a professional team; skilled counseling to be available when needed.
- Adequate care and treatment in a coordinated program of Commonwealth and local services.
 - 4. Appropriate education, either at school or at home.

Appropriate recreational facilities.

6. Vocational guidance and training.

- 7. Education of the public for acceptance and support.
- 8. Programs of research in causation and in the provision of services.

Modern training programs for professional workers.

II. QUALITATIVE AND QUANTITATIVE MEETING OF THESE NEEDS BY THE COMMON-WEALTH AND BY LOCAL SERVICES

The Commonwealth now provides services to the mentally retarded through the departments of public welfare, health, public instruction, labor and industry (bureau of vocational rehabilitation), and justice. None of these departments, to our knowledge, has developed an overall, long-range, realistic plan for the coordination, improvement, and expansion of its services to the mentally retarded, nor has the Commonwealth developed a program which would rationalize and coordinate the services provided by these departments. While there has been in recent years an increase in the provision of services by the various departments, it is our position that real progress in work toward a truly effective program awaits the preparation of a comprehensive 10-year plan which will serve as a guide in legislation and administrative work toward meeting present and expected needs of the mentally retarded.

Our association recognizes that advances in the organization and provision of services to all individuals requiring specialized skills will result inevitably in improvement in the services available to the mentally retarded. We welcome and support the activities of the Commonwealth toward these ends. Nevertheless we maintain that the needs of the mentally retarded are so extensive and the services to meet them so scattered that a plan specifically concerned with these

needs and the rationalization of services must be developed.

Department of public welfare

Over 3,000 mental retardates are on waiting lists for admission to the Commonwealth schools and hospitals for the mentally retarded. There should be no waiting list for services and care for which the Commonwealth has an obligation. The department has been hampered in the development of its program by staff shortages and limited financial appropriations and by the very extent of

the problems resulting from this long period of neglect. Phased construction of additional institution is now underway, but a serious lag still exists in the employment of headquarters staff charged with program planning and staff recruitment and training. Programs within the institutions are also limited by staff shortages of long standing and by the absence of established and comprehensive statements of program and treatment objectives which were impossible of achievement given lack of staff and lack of money. Relationships with communities and community services, while improving, are not yet the subject of well-coordinated planning and development within the department, although moves in this direction are now in progress. Research programs in the institutions are not coordinated nor sufficient in number and variety, nor is adequate headquarters staff provided to give leadership and continuity to research programs.

The department has taken an important step forward in the new legislation for which it secured passage, which provides funds for the support of local work-oriented programs for older age retardates. Training programs and internships for professionals are expanding but need to be tied into the com-

prehensive departmental plan we believe is required.

Department of public instruction

This department administers and supports classes providing training and education for mental retardates who are educable and for those who are trainable. In many areas classes are not provided for all retardates who could make use of them. The application of current regulations permits the deferment and excusal of retardates below the age of 8 and over 16, and insufficient attention and leadership has been given to the problem of developing appropriate curriculums for these age groups. Moreover, present legislation permits and supports training of the cerebral palsied, blind, and deaf in "preschool" age groups, but this financial support is not now available to the mentally retarded.

Headquarters staff in the Department is insufficient to give proper leadership and guidance to the special education classes conducted by the school districts, nor has the Department, so far as is known, taken appropriate steps to provide leadership in developing programs in special education to be undertaken in the

near future in the state (teacher) colleges.

So far as is known, no long-term plan for the development of headquarters services to the districts or to the teacher-training institutions exists.

Department of health

The programs of services to the mentally retarded provided by the department are increasing and improving. We believe that a review of the variety of services provided by public health nurses, maternal and child health clinics, and diagnostic and treatment clinics, with a view toward arriving at a comprehensive program for the department, and in relation to those of the other departments, is necessary.

Department of labor and industry (bureau of vocational rehabilitation)

The bureau has been active in support, evaluation, and training of limited numbers of retardates in sheltered workshop facilities in many parts of the State. The development of this program, however, has been spotty, and there is a serious need for staff programs of training for counselors responsible for this program.

Greater emphasis on the organization of program and the recruiting and development of staff in the Johnstown Rehabilitation Center in order to provide increased training programs for the retardate would seem to be indicated.

More intensive relationships between the BVR and the school districts in relation to coordinated training programs for the mentally retarded is necessary.

Department of justice

A critical review needs to be made of the programs provided by the justice department for the so-called defective delinquent.

Local services

Foremost among the needs on the local level is that of skilled diagnosis and evaluation which includes counseling for the parents and, where required for the

retardate as well. Nowhere in the State is this service offered to the extent required. Few, if any, communities provide the wide range of other services which would permit for each the full development of the capacities of the retarded. These would include home-training programs by public health nurses and visiting teachers, preschool training programs, adequately staffed and programed public school classes, recreation programs for all age levels, vocational training and sheltered employment facilities, and local residence shelters. While improved local planning is needed everywhere, we believe that the magnitude of the problem and the variety of skills required are such that the Commonwealth must assume the leadership both in planning for and in the provision of services which by their very nature cannot be developed or supported by the local communities.

III. CONCLUSIONS

We believe that the Commonwealth must take effective initiative in establishing a comprehensive long-term program of services to the mentally retarded. Such a plan, by virtue of its inclusiveness, would permit and require the development and support of related local programs of service.

It might also be added that such a plan, spotlighting as it would needed Commonwealth and local services, would permit more effective planning for the re-

quest and use of Federal funds.

It is our position that defined and comprehensive and appropriately staffed and coordinated programs for the mentally retarded are needed within the broad framework of services to all handicapped individuals, and without discrimination by virtue of diagnosis of mental retardation. We have reached no conclusion on the structure which will best provide these services and are aware of the advantages and disadvantages which might inhere in the establishment of administrative or legislative commissions to rationalize or administer these services. While we are eager that the greatest amount of progress be accomplished, we want to be certain that the proposals made are most likely to be accepted by the administration and the legislature. We welcome the opportunity to participate with the Governor's Committee on Handicapped Children in the search for the most effective means for meeting the needs of the mentally retarded.

Mr. Daniels. At this time we will declare a 2-minute recess in order to permit the photographers to take a picture because it is a violation of the committee rules to take pictures while the committee is in session.

(A short recess was taken.)

Mr. Daniels. Our next witness will be Mr. John Charlton, department of public instruction, Dover, Del.

STATEMENT OF JOHN CHARLTON, DEPARTMENT OF PUBLIC INSTRUCTION, DOVER, DEL.

Mr. Charlton. Mr. Chairman and members of the subcommittee, it is an honor and a pleasure to have this opportunity and to have been invited to give testimony on the most urgent need of Delaware in the field of special education and to make specific suggestions as to how the Federal Government might aid the States and local communities in attempting a solution to some of these pressing problems.

I bring you first the greetings and best wishes of His Excellency, J. Caleb Boggs, Governor of the State of Delaware, the first State, Mr. Duson, president of the board of education, and Mr. Millard, Jr.,

State superintendent of public instruction.

Delaware was the first State to ratify the Federal Constitution and since that time has taken great pride in being first in all of its endeavors for the benefit of citizens of our Nation.

This is the 10th year of our consolidated integrated and coordinated program of services in the division of child development and guidance.

What has formerly been known as the division of special education and mental hygiene was changed to child development and the guidance service were added on July 1, 1949.

Delaware has been a pioneer and leader, beginning with the ground

work of Dr. Robert.

Public popular support has increased to a point where there is tremendous enthusiasm for the assumption of the public education of the entire program for all exceptional children from the trainable

to the gifted.

Because of our rapid phenomenal growth we have tried to consolidate our gain and approach further expansion with all evidence available for objective and subjective evaluation.

In looking ahead we would approach each facet cautiously to improve our services with knowledge and information gained through pilot programs and intensive research in the State and in the Nation.

The Office of Education recently selected Delaware, New York, and Connecticut in a study as States having an emerging pattern of pupil personnel services.

Delaware is again taking the leadership role in the development of the trend throughout the United States in combining specialized educational programs under the administration of one division.

The coordinated and integrated services are rapidly becoming

known as an integral part of the total pupil personnel service.

This type of program makes it more possible to serve each individ-

ual child as a whole child or a total personality in a complete

This type of program makes it more possible to serve each individual child as a whole child or a total personality in a complete educational setting.

Our primary goal is to assist the local schools in State institutions with specialized educational services and personnel which will make it possible in Delaware to provide equal opportunities for every chlid regardless of his residence and in accordance with his interests, aptitudes, abilities, or disabilities.

The optimum development of each child is our goal.

There has been a great deal of misunderstanding about the word exceptional. However, we use the nationally adopted generic term to refer to those who deviate from what is supposed to be the average in physical, mental, emotional, or social characteristics to such an extent that they require special educational services in order to develop to their maximum capacity.

An exceptional child is, first of all, a child. But due to his exceptionality he needs special assistance to compensate for, or to make the

best use of, his abilities or his disabilities.

Without this special assistance approximately 10 to 12 percent of our general and school population cannot ever receive his birthright as an American citizen, the right to learn consistent with his capacity to learn in order to become economically useful and socially adjusted.

With Delayaria program I would estimate that we are meeting

With Delaware's program, I would estimate that we are meeting the basic needs of approximately half of our exceptional children.

During the last 10 years we made our greatest progress in our instructional program through the unit allocation law which makes it possible for any local school or district to receive a teacher's salary in accordance with the State schedule plus \$750 for each unit or major fraction thereof of the unit.

The unit means 25 in the elementary school; 20 in the secondary

school, and for exceptional children as follows:

The educable retarded, 15; Trainable retarded, six:

Socially and emotionally maladjusted, 15:

Partially sighted, 10;

Blind, eight.

Partially deaf or hard of hearing, 8, and orthopedic, 10.

Our State legislature has been very cooperative in providing funds for teachers. However, each succeeding year it becomes increasingly more difficult to secure funds for administration, supervisory and auxiliary services such as psychological, speech and hearing, education and social work, guidance workers, all of whom must be paid for out of the special appropriation or be taken from the unit allocation by increasing class sizes.

We have very good cooperation and coordination of services provided by State agencies. We provide consultation and supervisory

services in all State institutions for school age children.

There is some overlapping of services provided by the crippled chil-

dren's services and by the rehabilitation division.

However, I think I can say because of our close relationship and coordination of services that there is no duplication of services to individuals.

We believe we have one of the finest public school programs for

exceptional children in America.

Now the vocational rehabilitation program—I cannot speak officially for the Delaware vocational rehabilitation program and think

our State director, Mr. John G. King, has been here.

However, I can say that we have a fine relationship in coordinating our respective services. I am sure that Mr. King is quite proud of the excellent record that Delaware has made and the national recognition of having been rated at the top for many years.

We have some problems, but I am confident that we can continue

to solve them for the best interest of those concerned.

Now Delaware's position in population growth and finance and taxes, our little State consists of three counties; some say at high tide and only two at low tide. All of us think it is a very good State in which to live. Our population in 1950 was 230,000 and it has been predicted that by 1960 census it will reveal some 470,000 or more with no signs of slackening.

Per capita personal income in Delaware amounted to \$2,760 with

Connecticut exceeding Delaware by \$47.

In contrast in the lowest State the per capita income was \$1,053,

and the United States averaged \$2,057.

With almost any measure of wealth Delaware ranks in the top half of the Nation and usually in the top 10 or 20 percent. This was taken, not as a direct quote, but from a study, the Delaware School Study Council, on Physical Survey Bulletin No. 1, January 1960.

Delaware pays approximately 85 percent of all school costs at the State level. Over 50 percent of our schools receive 100 percent State support from the State level. All school construction is financed 60

percent State and 40 percent local.

We have one of the highest State-supported salary schedules in the country. Some of our schools in New Castle County and Wilmington area supplement the State salary up to an additional \$2,000 over the State schedule, and even with the schedule of \$3,200 to \$5,100 for the baccalaureate, with \$3,600 to \$5,900 for the master, masters plus \$3,400 to \$6,390, of the doctorate \$4,400 to \$6,700, we still cannot

compete with many of our neighbors.

It has been said that Delaware sends the Federal Government almost 10 times as much as it uses for its own State Government. It has also been said that Delaware sends \$6 to Washington for each \$1 it gets back in Federal funds.

I firmly believe that Delaware is financially able to provide for our educational services and our citizens are willing and able to pay for these services if we as leaders and educators will let our people know what needs are and see that these funds are properly administered

and accounted for.

Now, the need for help from the Federal Government. My preceding statements do not mean that we do not need help from the Federal Government. During the last few days in our Philadelphia workshop at our hearing many constructive recommendations were made. I wish to make the following suggestions:

1. That the Federal Government study the possibility of evaluating, assessing, consolidating, and reorganizing their present appropriations and organizational structure for the program of special

education and rehabilitation services.

2. That the Federal Government consider ways and means of as-

sisting States for the following:

Research: Treatment centers, both physical and mental. Program of prevention, early identification, diagnosis, treatment and education, publications in literature, clearinghouse for the Nation's practices, and methods and techniques.

Area national workshops with consultants and specialists sharing

the best in America.

Well-defined written statements requiring interagency articulation,

coordination, cooperation, and integration of services.

Funds for training of specialized teachers of exceptional children, psychologists, speech and hearing therapists, physical therapies, education and social workers, and other personnel.

Plans for teamwork and sharing by interdisciplinary cooperation

and cooperation by various media and professional know-how.

Pilot studies to demonstrate the need and value taken over by the States to carry on later.

Vocational training for slow learners and the retarded should be

provided.

Delaware needs most now—our greatest need in Delaware at this time is for more guidance counselors, speech and hearing therapists,

physical therapists, dental hygienists.

We need help especially in our two lower counties. The Government should consider, I believe, all of the assistance from the Federal Government should be on the basis to initiate, to encourage, to promote, and to extend services for exceptional children and for rehabilitation, but not forever subsidizing them.

I would suggest that financial support be given on a hundred-to-zero basis over a 5-year period. With a hundred percent the first year, 80 percent the second, 60 the third, 40 the fourth, 20 the fifth, and the sixth year all of the States should pay their own way, unless it could not afford the program, and then our children must be our most important consideration and receive these valuable services.

They should not suffer, but have a life worth living in accordance

with God's plan for all mankind.

I wish to commend the committee for their planning. If no Federal funds are granted, the emphasis which has been placed on the problem, to share ideas in the workshops and these deliberations in these hearings, will have far-reaching effects on the actions of our citizens throughout America far beyond any of our expectation for our exceptional children and adults in our own States.

Thank you very much. I have two printed bulletins and some mimeograph material which

I would like to leave for the committee, if they see fit.

Mr. Daniels. That will be filed for the record.

Mr. Charlton. I have no copy of this. I would like permission to

type it and show the boss what I said.

Mr. Daniels. I might suggest this, sir, if you can have it typed and mailed to the committee within the next 10 days.

Mr. Charlton. I will appreciate that.

Mr. Daniels. Are there any questions? Mr. Giaimo. I would like to commend the gentleman for a very fine and informative statement and one which I think is very helpful.

Thank you for your references, you have been rather kind to Con-

necticut.

Mr. Quie. I also want to commend you for your statement. Between 1955 and 1957 you made quite a thorough study of the special educational needs in the State of Minnesota and we used the example of Delaware quite extensively not only in our deliberations, but also when we decided on the kind of program we passed in the 1957 session of legislature.

I can see that your presentation is consistent with what you have

done in the past that we studied at that time.

Mr. CHARLTON. Thank you.

Mr. Daniels. I want to thank you for the fine work that has gone

into the statement you have made.

Mr. Charlton. May I mention that we have an annual census of exceptional children where I get the names of every child in our public schools who is in need of our services.

We are still not meeting them, but at least we know where most of

them are and who they are.

Thank you very much.

Dr. Barnard. Mr. Chairman, I would like to request that at this place in the record the statement of the Reverend Carl Futchs, of the Lutheran Welfare Association of New Jersey, be entered.

Mr. Daniels. Without objection, the statement of Dr. Futchs will

be entered in the record at this point.

(The statement referred to follows:)

STATEMENT BY THE REVEREND CARL FUTCHS, EXECUTIVE SECRETARY, THE LUTHERAN WELFARE ASSOCIATION OF NEW JERSEY

It is a privilege to be able to testify to this committee concerning the needs for preventative and rehabilitative care as seen by my staff.

NEEDS FOR TRAINED PERSONNEL

Invariably when the subject of welfare needs of people arises, the tremendous need for trained personnel is raised immediately. This is true of teachers trained in prevention and rehabilitation in all areas of need of the handicapped.

It is good to see this stressed in House Joint Resolution 494 with regard to the needs of the deaf. The lack of trained social caseworkers in all the areas of need is tragically evident. The wide use of untrained (high school and college graduates) personnel is extremely costly in delay, emotional upset, and detrimental even to the eventual helpfulness in solving the problem. This is true, also, in actual dollars and cents costs. A devoted and fully trained worker is capable of professional and accurate diagnosis of emotional need (which is usually the basic need even in physical handicap) in a much shorter period of time and with less upset to the person served than can the untrained. In my opinion, therefore, it is mandatory that recruitment efforts and scholarship helps must be provided in the areas of service covered by the study of this committee. Such action as that recently taken by the New York State legislature is deplorable and detrimental to good service. Lack of trained personnel to do the work that must be done makes such action necessary.

Prevention.—More study of causes and prevention or at least early diagnosis and treatment of all physical and emotional handicap is another essential. Too much time, money, and effort has been centered on help toward amelioration of conditions which result from these handicaps rather than in prevention. Recent excellent examples of the benefits of such study is the Salk vaccine and the study of the effect of too much oxygen upon the eyesight of babies born prematurely. Such studies would certainly be helpful in the areas of emotional need such as mental and emotional breakdown, delinquency, family deterioration, etc.

Here I would underscore the need (1) for early detection of these disorders by more research, more clinics, and more school psychologists; (2) for community resources for rehabilitation of ex-mental patients, more social workers are needed to handle individual case services and to do educational and liaison work with other agencies, organizations, and industry. Outpatient clinics to serve those who do not need hospitalization and those who have been discharged from hospitals; (3) psychiatric wards or wings attached to general hospitals would serve to facilitate services to those who need them.

1. Stimulation through publicity and financial help in the development of home care and homemaker services and other such helping prevention services will do much to sustain persons of all ages and conditions in situations where minimal help is required. For instance, the matter of proper food intake of older people will do much to prevent senility and dependence upon medical and mental hospital services. This is true of alcoholism also.

2. Rehabilitation of handicapped persons must be realistic or it can be detrimental instead of helpful. To train a deaf mute in the use of an IBM machine when sewing on a piecework basis is the only work available can be a waste of time of the teacher and pupil as well as being an emotional upset to the pupil.

3. Legislation: I find that in some respects the wide variance in the laws and practices of various States provide hardship to those they were meant to serve. Residence requirements from one State to another and even one county to another work handicap upon such persons as the aging and the child. In these times of such a mobile population it would seem that all States should have automatic and immediate reciprocal residence regulations based upon economic conditions within each community.

Better and more even legislation is necessary within and between States regarding the preservation of the rights of children, the rights of parents, and the termination of parental rights in cases of continued neglect and desertion of children

The need for legislation change is true with regard to the needs of the mentally ill for treatment in clinics and in hospitalization. The law means to protect the person but it is based upon the ability of the person to recognize his own need when frequently the person is totally unable to know his need. The result is that often a tragedy to the person himself or to others takes place before treatment can be brought to the person.

These admittedly are ticklish problems and need careful analysis and action. 4. Education of the public: Publicity of findings and experience of others and how these experiments were developed would be helpful and stimulating in provoking thought and action. The recent article in Time magazine concerning the B & K enterprises of Oakland, Calif., which employed only those persons who had been mentally ill is thrilling, educational, and conducive to further action and understanding.

5. Administration: It is my opinion that the local community should, as far as possible, administer the programs in order to maintain local initiative and

stimulate local planning. Certain standards should be required by the Federal Government for the effectual operation. Local community, public, and private agencies and even private industry should be utilized to administer the program on a nonprofit basis. Wherever it is possible all such assistance should be removed from political influence and placed under the administration of personnel on the basis of experience, knowledge, and ability.

Thank you for the privilege of this appearance.

Mr. Daniels. Our next witness is Dr. Leon Charney, educational consultant for the Association for Retarded Children.

Mr. Charney, you may proceed.

STATEMENT OF DR. LEON CHARNEY, EDUCATIONAL CONSULTANT. NATIONAL ASSOCIATION FOR RETARDED CHILDREN, NEW YORK, N.Y.

Dr. Charney. Mr. Chairman, may I express my personal gratitude, and that of the National Association for Retarded Children, for this opportunity to participate in the functioning of a committee whose activities have been instrumental in focusing the attention of the Nation on the problems of exceptional children and adults.

It has been said that each generation has the responsibility for evaluation of both the goals toward which it strives and the extent of the progress made in the direction of those goals. In effect, the

activities of this committee are part of such an evaluation.

Professionals and the general public are, as a result, reexamining the degre to which we have implemented the doctrine that the national welfare is enhanced in direct proportion to the ability of each individual to achieve to his maximum potential. In a very real sense, the history of the United States is reflected in the history of exceptional children and youth, and we can trace the broadening of our democratic ideals in the changing attitudes toward those who differ intellectually, physically, socially, or emotionally from the norm.

The National Association for Retarded Children, although specifically concerned with promoting the welfare of the mentally retarded, recognizes the strong ties of common interest and responsibility which unite our organization with those concerned with the deaf, blind. physically handicapped, and emotionally disturbed. Since disabilities tend to occur in multiplicities, it is hardly surprising that many of the outstanding issues and problems in the field of special education and rehabilitation cut across areas of specific interest and require a total united effort for their solution.

It is indeed startling to discover that the most reliable estimates: reveal that not more than 1 in 4 of the children in the categories mentioned, are receiving the special educational services which they require if we are to implement the philosophy outlined above. A wide variation is noted from State to State in the degree to which public-

school services are available to such children.

In an attempt to present as broad a picture as possible of the current status of public school services to exceptional children, I should like to report on a number of States selected at random from the files of the National Association for Retarded Children.

In 1955 the State of California Interim Commission on the Education and Rehabilitation of Handicapped Children and Adults estimated that only one-third of the handicapped children in that State

were receiving any type of special education. In 1957 the commission reported:

While we have made some gains in these areas, the increase in our population, particularly among children of school age, has tended to outrun the gains.

The division of special education of the State of Iowa in 1956 estimated that there were 13,275 children with IQ's under 69 in that State. At the time of that report, 4,901 children were in special classes for the retarded.

In 1959 the Missouri Coordinating Committee for the Handicapped estimated that there were approximately 72,000 physically or mentally handicapped children in that State. At the time of that report, 32,201

children were in special classes.

In 1958 the Maine Commission on Problems of the Mentally Retarded estimated that there were 6,800 retarded children between the ages of 5 and 16 in the State of Maine. Of this number, 400 were in

special classes.

The Oregon Interim Committee on Mental Retardation and Emotional Disturbance estimated than in 1958 there were between 6,000 and 9,000 children in that State eligible for placement in special classes for the mentally retarded. During the school year 1958–59, approximately 500 children were in such classes.

The report of the Illinois Commission on Mental Retardation in 1958 revealed that the schools were not providing for 75 percent of the educable mentally retarded children in that State, and were not providing for 93 percent of the trainable mentally retarded

children in that State.

In 1957 the Indiana Legislative Study Committee on Mental Retardation estimated that 16 percent of the children suspected of mental retardation were being served in special classes for the retarded.

In 1959 the Kentucky Department of Education reported that 74 percent of the handicapped children of all types in that State were

receiving some sort of special service.

Some evidence of the degree to which the States are concerned with this problem is indicated by the fact that between 1956 and 1959 no fewer than 20 legislative or Governor's commissions were functioning in the area of mental retardation alone. Since the time of this report, several additional States have established such commissions.

At a recent conference of national organizations in the area of special education, representatives of a wide variety of agencies quickly delineated areas of common concern. These areas were strikingly similar to the problems confronting the various States as revealed in

the reports described earlier.

One of the most pressing of the common problems in the area of special education is the severe shortage of administrative and supervisory personnel at a local and State level. While Public Law 85–926 will do much to alleviate this problem in the area of mental retardation, it will be necessary to broaden the provisions of this law to cover other areas of exceptionality if a program of total services is to be evolved.

In the words of the 1958-59 annual report issued by the Department of Education of the State of Colorado, one factor handicapping expansion of special programs was "lack of sufficient personnel at the State level to provide adequate consultative services when districts:

were planning programs. Without consistent advisory assistance during the initial stages of planning a special education program, there frequently has been a delay in the establishment of classes."

The problem of securing adequately trained teachers is mounting in intensity in the field of special education. In 1955 Samuel M. Brownell, former commissioner of education, noted that there existed in the United States on the average, 180 exceptional children for each specially trained teacher.

As educators and the general public become increasingly aware of the tragic waste of human resources represented in our failure to provide necessary services, the demand for adequately trained teachers will be felt ever more keenly. Once again, the extension of Public Law 85–926 will be a positive step in meeting this ever mounting need for adequately trained teaching personnel.

The State of New York, through its training grant program for teachers or future teachers of retarded children, has demonstrated that something can be done about this problem at the State level.

In the 3 years that this program has been in operation, 1,553 awards have been made to 1,027 persons training to teach the mentally retarded. Of these, 1,027 persons, 958 are now teaching classes for the mentally retarded. Seventeen colleges and universities are cooperating in this program, and the continued growth of the program is anticipated.

The success of this undertaking can serve as a guide to other States, not only in respect to training teachers for the mentally retarded, but

in reference to training teachers for all exceptional children.

A most pressing problem in the field of special education concerns the development of procedures for the guidance and assistance of less affluent States in respect to the establishment of such a program.

At the conference of national organizations mentioned earlier, it was quickly recognized that all participants were concerned with the problem of early diagnosis and placement of exceptional children. Whereas in 1949 not a single specialized clinic existed for the diagnosis of the mentally retarded, at the present time there exists over 70 such clinics.

To meet the need in the area of the mentally retarded alone will necessitate the further allocation of funds to the U.S. Children's Bureau for the expansion of such clinical facilities for the mentally retarded, and for the development of traveling clinics to serve the

often neglected rural areas of the United States.

In view of the generic need for early diagnosis and placement, which characterizes all exceptional children, and in view of the multiplicity of handicaps which occur, there is a great need for the establishment of procedures for the coordination of the activities of these clinics with the programs of the public schools and other public agencies.

Early placement of handicapped children is as vital as early diagnosis. In the area of the mentally retarded, the State of Massachusetts, through the 24 nursery training centers operated for preschool retarded children, has demonstrated the effectiveness of such a program. What has been done in Massachusetts for preschool mentally retarded children can be done in other States and for other exceptionalities.

Of vital concern is a recognition of the need for the establishment of minimum standards in the area of diagnosis, teacher certification requirements, and course content at institutions of higher education.

A recent survey of State certification requirements in special education reveals 7 States with no special standards, and 43 States with standards in at least one area. While since 1954, 11 States have initiated certification requirements in special education, and 22 States have revised their standards, examination of the results of the survey reveals wide diversity in the number of credit hours required by different States for certification of teachers in specific special areas.

The report indicates, "It should be noted that only in the area of speech and hearing therapy do the recommended standards of a professional organization (American Speech and Hearing Association), have a noticeable impact upon consistency of amount and degree of

training required."

Not only does this diversity result in confusion in the minds of potential teachers, but it serves to erect barriers between States where none need exist. Thus, a person qualified to teach retarded children in California, may be unable to secure certification in New York in spite of the fact that both States have outstanding programs. In this age of mobility, the seriousness of this problem cannot be too greatly emphasized.

The development of regional groupings has indicated that such a regional approach possesses tremendous potential for overcoming many of the problems in reference to teacher education and the provision of direct services to children. This potential has already been demonstrated by the activities of the Southern Regional Education

Board.

Operating on a philosophy that the member States by themselves may develop ineffective programs, an attempt is being made to develop regionwide services. Participants in this development are representatives from Alabama, Arkansas, Delaware, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia.

In States which are essentially nonurban in nature, a similar approach is underway through the activities of the Western Interstate

Commission for Higher Education.

Nowhere is guidance and assistance more sorely needed than in the area of the development of work training programs for mentally retarded adolescents. A recent survey of public school systems having classes for the mentally retarded at the secondary level, reveals that less than 10 percent of such children remained in school through the 12th school year.

The major needs indicated by the school systems surveyed appeared to be in the area of the development of work training programs. When one considers that retarded children need more, not less preparation for adult life, the revelation that 10 percent or less of such children remain in school through the 12th school year, makes the

development of such work training programs of vital importance.

Successful programs are, to mention but a few, in operation in
Detroit, Mich., Jacksonville, Fla., and Santa Barbara, Calif. In their

totality, however, the existing programs are the exception rather than the rule, and are far from meeting the known needs in this area.

As a result of the splendid legislation enacted by Congress in the area of vocational rehabilitation, the past few years have witnessed a gratifying increase in the number of sheltered workshops and voca-

tional training facilities available to the handicapped.

The Office of Vocational Rehabilitation has demonstrated its awareness of the need for establishing the closest possible working relationships with those in the field of special education. There is every indication that the need for close liaison between the Office of Vocational Rehabilitation and the Section on Exceptional Children and Youth of the Office of Education, will mount in intensity.

In reference to all the problems I have outlined above, one vital course of action is the development of additional staff resources for the Section on Exceptional Children and Youth. It has been amply demonstrated that attempts are being made at the State and local level to serve the children with whom we are here concerned.

What is needed is the guidance of these activities by some agency capable of developing consensus in reference to problems of administration, teacher recruitment, financial procedures, certification, et

That agency is the Section on Exceptional Children and Youth of the Office of Education. An example of the type of leadership contribution which the Section on Exceptional Children and Youth and the Office of Vocational Rehabilitation can make, has been demonstrated in the outstanding service rendered by these two agencies in their development and publication of the booklet, "Preparation of Mentally Retarded Youth for Gainful Employment.

The Governor's commissions exist, the regional organizations are growing, the public is alerted. Guidance from a Section on Exceptional Children and Youth capable of developing close ties with the Office of Vocational Rehabilitation, capable of providing consultative services, capable of developing institutes and conferences, of sponsoring surveys, of issuing bulletins, and capable of stimulating leadership at all levels, is now more than ever before, vitally needed.

The responsibility for the effective utilization of the potential of the exceptional child rests ultimately with the State, the local school district, and the local community. Leadership from the Children's Bureau, the Office of Education, the Office of Vocational Rehabilitation and other Federal agencies, through consultative services and through the stimulation of the type of activities I have described above, can do much to develop community recognition that the exceptional child can make a contribution to the welfare of the community. the State, and the Nation.

Mr. Daniels. Thank you very much, Dr. Charney, for that very

I know a great deal of work has gone into it. We appreciate your coming here.

Mr. Charney. Thank you. Dr. Barnard. Mr. Chairman, I would like to ask that at this time the statement of the Reverend Richard M. McGuinness, director of the Mount Carmel Guild Center for the Blind, 99 Central Avenue, Newark 2, N.J., be made a part of the record.

Mr. Daniels. Without objection, the statement will be made a part of the record at this point.

(The statement referred to follows:)

STATEMENT OF REV. RICHARD M. McGuiness, Director, Mount Carmel GUILD, NEWARK, N.J.

I should like to express my thanks to this subcommittee for allowing me to testify today. My own interest is with the legislation connected with work for the blind. For 5 years I have been director of the Mount Carmel Guild Center for the Blind, located at 99 Central Avenue, Newark, N.J.

This centers offers educational, recreational, and social opportunities for blind persons regardless of race or religion. At present we have over 800 blind members who live in Essex, Bergen, Union, and Hudson Counties.

Our activities are rehabilitative in the sense that we believe they will aid in making the blind persons who participate in them more active and independent. Activities at present include, in addition to our social meetings, classes in bowling, braille, script, ceramics, jewelrymaking, sewing, carpentry, radio, dancing, cooking, and home nursing. We publish a newsletter in print and braille and transcribe tape recordings of various magazines each month.

I have read the report of the Workshop on Special Education and Rehabilita-tion of the Blind held in New York, N.Y., on October 27 and 28, 1959, and given to the Subcommittee on Education and Labor of the U.S. House of Representatives and wish to express my agreement with the views there expressed.

The aim of all work for the blind, both in the field of special education and in the field of rehabilitation, is to render the blind person capable of living as independently as possible. In my opinion independent living will never be achieved unless the handicapped individual's right to make decisions, choices,

and mistakes for himself is respected.

I do not pretend to have the answer to the problem of guaranteeing this right in the best possible way. But I raise the question I do not believe we can help a person become a mature, independent, contributing member of society if someone else is making all his decisions for him. In order to help him assume responsibility for his own future, I should recommend that wherever possible Federal or State funds be given directly to the individual, so that he himself purchases the educational or rehabilitative service he requires. The money would have to be given in such a way that it could be used by the individual only for such services, not for other purposes.

In this way, the blind individual would go to a public or private agency, not as a client with hat in hand looking for a service, but rather as a prospective

buyer who wishes to purchase a service.

I do not know if such an approach can be worked in all cases, but I do think it at least expresses an attempt to implement the philosophy that all workers for the blind subscribe to: that it is the blind individual who counts, and that he should be helped to become as independent and active a member of society as possible.

Mr. Daniels. I would like to call at this time as a witness the Rev-

erend D. Roland Gerhold.

Reverend Gerhold, will you state whom you are representing here today?

STATEMENT OF REV. C. ROLAND GERHOLD, NEWARK, N.J.

Dr. Gerhold. I am one of 40 missionaries to the deaf under the Board of Missions to the Deaf, Lutheran Church, Missouri Synod, 210 North Broadway, St. Louis, Mo.

I have served as pastor to the deaf for 12 years in all New England States and now in the State of New Jersey I am presently pastor of St. Matthew's Lutheran Church for the Deaf in Newark.

I preach to the deaf in eight of the major cities in New Jersey. I conduct religious training education programs, Bruce School, Newark, North Jersey Training School for Girls—mentally retarded—NJSD, in West Trenton.

I am on the board of trustees of Gallaudet Home for the Deaf, under the Episcopal Diocese of New York, northern and southern

New Jersey.

I am spiritual adviser of chapters of the Protestant Guild for the Deaf, a nonprofit organization of hearing and deaf, with the purpose of serving the deaf, by learning to know and understand them, by aiding the deaf to obtain jobs, by visiting the deaf in institutions, by educating hearing people to the needs and problems of the deaf.

Mr. Daniels. How do you find time to devote all your time to all

these activities?

Dr. Gerhold. I don't. I do have an assistant, though. I am for

the passage of H.R. 494.

I was here yesterday and in all the testimony about the need for qualified teachers of the deaf and other trained workers assisting the deaf toward overcoming their problems, let us not forget the great problem of communication.

Related to this is the social language of the deaf, gestures, signs. From experience and research, most educators of the deaf agree to three major groupings of educable deaf—I stress the word "can":

1. Those who can learn solely by the oral method.

2. Those who can learn only by signs.

3. Those who can learn by the combined oral-sign methods.

Though educators and psychologists may present varying percentages for these groupings, the majority group is, those who can learn

by the combined method.

To this group we add those who cannot learn by the oral method, but by signs only. This group, some have estimated from 60 to 85 percent of all the deaf. This larger group uses the signs as a social language.

Communication is a two-way path. The deaf communicate with hearing people, using their speech, which they have in varying degrees,

and their social language.

In order for selected representatives of the hearing world to understand the deaf in school and adult life situations, the ability to use the sign language for sending and receiving information is necessary.

Several fine books are available. These describe the signs as well as picture them, but they are inadequate, for the sign language is fluid,

and as such must be demonstrated in order to learn it.

One of my responsibilities is teaching sign language to new members on the staff of the New Jersey School for the Deaf in West Trenton. You can realize the 50 percent stressed by Miss Titsworth yesterday of new teachers without a background in the techniques of the deaf that this would be one of my interesting contacts.

Permit me to quote from Dr. J. Schuler Long's "Sign Language Manual," page 107. This manual is used at Gallaudet College in

Washington, D.C., the only college for deaf in the world:

Good: * * * Place the end of the palm against the mouth; then bring it down against the open left hand so the back of the right hand rests in the palm of the left.

Bad: * * * Same position of the hand as in "good." In bringing the hand away, draw it slightly toward the right, turn it palm down and throw the hand downward.

Now I demonstrate.

An agency of our Government provides educational material for the blind, transcribed in braille and sound. Recently one agency has entered the field of captioning outstanding movies and making them available to deaf clubs.

I propose to your committee, therefore, that it consider allocating a portion of the funds for teacher education outlined in the bill, H.R.

494, for producing an instructional sign language film.

Copies of this film would assist teachers for the deaf, supervisors, and house parents; as well as parents of deaf children in learning the signs. We know that parents do not need signs to understand their children or be understood by them, but when they meet their children's deaf friends, they will want to understand and be understood by them.

Such a film would assist the personnel of private and Government agencies in acquiring the sign language, thus broadening their at-

tempts at resolving the problems of the deaf.

Thank you.

Mr. DANIELS. Reverend Gerhold, are any such films in existence at the present time?

Dr. Gerhold. I know of none, not even down at Gallaudet College.

Mr. Daniels. But you make this recommendation?

Dr. Gerhold. I certainly do.

Mr. Daniels. This is based on your experience?

Dr. Gerhold. Based on my discussions with the consultation department at the New Jersey School for the Deaf, at other schools where teachers have found the need of learning the sign language.

It just is impossible to have enough interpreters present or to learn

through deaf people or interpreters the signs.

Mr. Daniels. These will be used for educational purposes on the

elementary school lines, or advanced stages of education?

Dr. Gerhold. This would be used with the educators themselves and I feel they would be used by departments of rehabilitation and also in U.S. Employment Service to train their personnel.

Mr. Daniels. Are there any questions?

Thank you very kindly.

Dr. Gerhold. Thank you, Mr. Chairman.

Mr. Daniels. Our next witness is Mrs. Teresa D. Carroll, supervisor of classes for children mentally handicapped, public schools of Jersey City, N.J.

STATEMENT OF MRS. M. TERESA D. CARROLL, SUPERVISOR OF CLASSES FOR CHILDREN MENTALLY HANDICAPPED, PUBLIC SCHOOLS OF JERSEY CITY, N.J.

Mrs. Carroll. Mr. Chairman and members of the committee, I bring you greetings from Dr. James E. Reynolds, superintendent of schools of Jersey City, and Mr. Vincent O'Shea, assistant superintendent of schools, who is in charge of the entire field of special education, Jersey City.

New Jersey is 1 of the first 13 States in the Union to pass mandatory laws for the training of the mentally retarded children. Jersey

City opened its first class in that same year, which was 1911.

We at the present time have 29 classes for the training of the mentally retarded. Twenty classes are for the training of the educable

retarded child and nine for the severely retarded.

With a population of somewhat over 300,000 in the city, we feel that great strides have been made in this field of special education in Jersey City, but with all we don't feel that we are entirely meeting the needs.

There is a great deal yet to be done. Children living in a democracy

have a right to expect equality of educational opportunities.

Unmet needs in the field of special education are in conflict with

democratic precepts.

Now, in order to remedy these unmet needs, we feel that the beginnings are in the colleges where sufficient funds are needed for them to inaugurate complete programs for certification in the field of special education.

Not to many of the colleges have complete courses for this certification at this time. Many of them have a few courses, but not too many

have courses that would lead to complete certification.

Then colleges need money in order to offer scholarships to encourage students to become interested in the vitally needed areas in special education training. Money is needed to aid school districts for the purpose of creating additional special classes for handicapped children which would give these children the equality of opportunity which is presently denied them in education.

Money is needed to provide adequate rehabilitation services for

these children.

Then sufficient sheltered workshops wherein work capacities can be evaluated and developed particularly when individuals cannot be absorbed in the competitive labor market. There are very few of these sheltered workshops in existence in proportion to the need. In Jersey City we have one privately organized workshop, but it is not a sheltered workshop. It would take care of the educable mentally retarded, but so far to this point we haven't any arrangements for the severely handicapped child who leaves school and has no means of furthering his education.

We cannot afford to deny these children the training they rightly

should receive or to reject the services that they can render.

In addition transportation and luncheon facilities are needed to implement this program.

I am very grateful to you for allowing me to give my report.

Mr. Daniels. Thank you very much for coming here, Mrs. Carroll, and giving the committee the benefit of your statement.

Mrs. Carroll. Thank you.

Mr. Daniels. Our next witness is Eleanor J. Carlin, associate professor, division of physical therapy, School of Allied Medical Professions, University of Pennsylvania.

STATEMENT OF ELEANOR J. CARLIN, ASSOCIATE PROFESSOR, DI-VISION OF PHYSICAL THERAPY, SCHOOL OF APPLIED MEDICAL PROFESSIONS, UNIVERSITY OF PENNSYLVANIA

Miss Carlin. Thank you, sir.

I have a prepared statement which I will submit with your permission, and ask for only half of my 10 minutes to outline a few

points which I feel have not been brought out in relation to this statement.

Mr. Daniels. Without objection, your prepared statement will be filed in the record following your oral testimony.

Miss Carlin. Thank you, sir.

I represent actually the field of physical therapy and somewhat in-

directly the field of occupational therapy.

I think perhaps you realize that my prepared statement, having heard all the testimony I have heard today and what you must have heard in the last few days, deals primarily with the personnel shortage. I think it has become quite an obvious fact that this is a real and unmet need in the health care of our citizens.

I feel there are one or two points which might be brought out here to you this afternoon which may highlight some of the ap-

proaches to the personnel shortage.

One of the most important things I feel has not been said is that the personnel to fill this personnel shortage exists. We do not have 180 million people in this country for nothing, and we are getting more and more of them every day as the maternity wards-

Mr. Daniels. We should encourage people to follow this profes-

sion?

Miss Carlin. It is more than an education. I think we must first inform them. I think we are taking for granted that the people know that profession exists in the first place.

I think one of the biggest unmet problems we have right now is a total crash program of propaganda, information to the general public,

not just to the school child.

Mr. Daniels. Do you think it is the role of the State or Federal Government?

Miss Carlin. The Federal Government and State governments,

both have a responsibility in this.

One thing that has been lost sight of, Mr. Daniels, is that during the years of 1941 to 1943, we did this. We needed to double our numbers of physical therapists in the country and we did it. We got the numbers in 2 years that it had taken us 25 years to establish. We did it because there was a reason for it. I think this same

thing could be done at the present moment.

I believe this is true in almost all the related and allied medical personnel groups that we are dealing with as far as shortages are concerned.

The point to my statement is that I would hope that some consideration could be given to a total program of informing the general public of the existence of these professions.

I think that when you get more people aware of them you will have

more people coming in these professions.

I think the second point I would like to make, and this was brought up this morning and I wish to speak to it, there were several people who mentioned it.

One of our problems in the personnel shortage is salaries. I am not entirely convinced this is the answer. I am not sure we can buy

people for these professions.

I would hope, sir, that we have not yet reached the stage in this country where what you make is the only thing that sends you into a particular profession.

I can say from my own experience in having taught physical therapies for many years that the student's first concern is what he is going

to make, is a second-class physical therapist.

I am convinced we have people who are service oriented in this world. When you have a more informed general population, you will have more persons who will come to work at an equitable salary, but we do not have to think constantly in terms of raising salaries in order to fill this personnel shortage. This has to stop someplace, or else we will price ourselves out of existence.

Mr. Daniels. In some States and in some areas the salaries are very

Miss Carlin. I agree with you. When I used the word "equitable," I meant there must be a base limit to these as well, but I don't think we can just take the attitude by raising all salaries of medical personnel you will get more people. I don't think that is the answer

Mr. Daniels. And you will not necessarily get the best qualified

talents.

Miss Carlin. That is right. I have heard mentioned several times in the testimony this morning our workshop in Philadelphia, a cliche, if you will, of how to solve the whole problem, by putting in nonprofessional personnel.

I would like to go on record as being very strongly opposed to the utilization of nonprofessional personnel to fill this so-called personnel

shortage.

Everyone in this room is, I am afraid, some day going to need the services of the physical and the occupational therapist, the medical technologies and the doctor. I would not wish someone half trained to work on me. I am sure no one in this room would, either.

I think if we go back to our original basic point that if you inform the public this exists, you will get the people interested in it, and there will be no need for the fourth-class technician doing the job which the first-class professional must do.

Thank you for your courtesy, gentlemen.

Mr. Daniels. Thank you. You have had a great deal of patience in waiting this late in the afternoon to testify. We do appreciate your coming here and giving us the benefit of your ideas and thoughts on this very important subject.

Miss Carlin. Thank you, sir; it has been my pleasure.

(The formal statement of Miss Carlin follows:)

FORMAL STATEMENT OF ELEANOR J. CARLIN, ASSOCIATE PROFESSOR, DIVISION OF PHYSICAL THERAPY, UNIVERSITY OF PENNSYLVANIA

The statement which I wish to present is primarily concerned with the fields of physical and occupational therapy, as they relate to the overall area of rehabilitation. In assessing the most urgent and unmet needs of these fields, one primary factor stands out vividly. The most urgent need is that of securing and training more young men and women to become qualified physical and occupational therapists.

Granted that thousands of citizens in need of rehabilitation exist, the fact remains that no survey, no additional buildings, and no expansion of facilities is of any value unless trained personnel can be secured to administer treat-

We have at present a rapidly increasing number of rehabilitaiton centers, both public and private, being established throughout the country. Numerous centers which have been in existence for many years are expanding their physical plant or planning to expand it. In the four States concerned in these hearings (Delaware, Maryland, New Jersey, and Pennsylvania) we have presently adequate training facilities for physical and occupational therapy students.

The problem really revolves around the fact that the existing facilities are, for the most part, unable to secure adequate staff and none of the schools has

full enrollment.

It would appear that to continue to expand centers is unrealistic until some assurance can be given that adequate personnel will be available to staff them. Referring to the "independent living" proposal, it has great merit and represents a real need for a large segment of our population. But the objectives of this bill will be realized only when sufficient numbers of trained people are available to implement it. More and larger buildings are far from the answer to the problem.

What is needed is a national emphasis on recruiting young men and women into these fields and increased financial help to assure them of qualified training. In a sense, a total push program of information, publicity, and propaganda to familiarize the general public with the opportunities these careers present

must be instituted at the earliest possible date.

We must recognize the fact that the general public is still totally unaware of many of the professions allied with medicine. It is not merely a question of recruitment, but first the need to introduce these professions and to emphasize the contribution they will be called upon to make to the general health of our Nation.

The present total enrollment in the 39 approved physical therapy schools is 706. This, in a Nation of nearly 180 million is a pitifully small number. It has been conservatively estimated that we should be enrolling 3,000 each year. But this cannot be realized until the public is informed. This would represent one vital service the Federal Government could provide to answer the most basic unmet need of our health and welfare services.

Mr. Daniels. Our next witness is Mr. James M. Robins, chairman of the Legislative Committee, National Association of Social Workers, Newark, N.J.

You may proceed.

STATEMENT OF JAMES M. ROBINS, REPRESENTING THE NORTH JERSEY CHAPTER OF THE NATIONAL ASSOCIATION OF SOCIAL WORKERS

Mr. Robins. I am James M. Robins, representing the North Jersey

Chapter of the National Association of Social Workers.

Our association is pleased to testify at this hearing, which we feel will result in a valuable contribution to the field of rehabilitation. The committee is to be commended for its interest in helping people and for its attempts to obtain pertinent information which will enable it to make an objective decision.

Social achievement of self-sufficiency on the part of the severely disabled individual is basic. Physical restoration of the individual to the point where he can take care of his own needs and thus relieve the family of a constant burden will promote a happier existence for the individual himself and the family. An important part of the program is that the individual, who has been in constant attendance caring for the needs of the handicapped person, will be relieved to the point where he may very well be available for outside employment.

Of significance is the development of the sense of self-worth and a feeling that a disabled individual is carrying his share of the responsibility within the family unit, thereby restoring the human dignity

which is essental to our way of life.

Seriously to be considered is the prevention of the institutionalization of some of these persons, thus saving badly needed space for

others. It is conceivable that the future expenditures for capital investment for new institutions can very well be curtailed as a result of providing independent living. Such individuals will remain in the home rather than be placed in an institution, which will result in sayings to the taxpayer.

We can recognize together that the proposed appropriation essentially allows for a demonstration of an idea which we hope will later

warrant an increased appropriation.

Rehabilitation is a concept which must pervade all fields of services: public health, public welfare, and vocational rehabilitation. The NASW carefully appraised this proposed legislation through consultation with representatives of the various units of the Department of Health, Education, and Welfare and in a conference of representatives of the American Hospital Association, American Medical Association, American Public Health Association, American Public Welfare Association, and the National Rehabilitation Association.

The association's conviction as to the importance of programs geared to assisting the handicapped individual in achieving a maximum of independent functioning is emphasized in the various statements pub-

lished by our association.

Our association holds that the most desirable legislation at this time is to provide substantial Federal participation in State and local demonstration projects which under proper Federal-State-local coordination would encourage and strengthen health, vocational rehabilitation, and welfare programs designed to assist the severely handicapped.

We extend our best wishes to the committee in working out a program which will increase the happiness of disabled individuals and

lessen the burden for their families.

I might add in our own field of social work there is a shortage of personnel and it is important to train personnel that will fit into this

program of independent living.

We extend our best wishes to the committee in working out a program which will increase the happiness of disabled individuals and lessen the burden for their families.

Thank you.

Mr. Daniels. Are there any questions, Mr. Chairman?

Mr. Elliott. Except to say, as is always true, I have enjoyed the very able statement of the gentleman who has spoken to us, Mr. Robins.

Mr. Daniels. Thank you very much, Mr. Robins.

Mr. Robins. Thank you.

Mr. Daniels. I believe our final witness of the day is Mrs. Donald B. Hurwitz. I do not know if we have overlooked anyone. Is there anyone present in the audience who desires to testify before this committee? If not, I wish to express my thanks and gratitude of the committee to all persons who have come here to give us the benefit of their ideas and views in this very important field of special education and rehabilitation. Thank you very much.

(The following statement was submitted:)

STATEMENT OF GRACE E. MILLS, PROGRAM CONSULTANT, CONNECTICUT CHAPTER, NATIONAL SOCIETY FOR THE PREVENTION OF BLINDNESS

It is the thought of our group, the Connecticut Chapter for the Prevention of Blindness, that the education of the partially sighted child has not been adequately emphasized. Provisions for training and educating the legally blind have been made but the partially sighted group have not been given adequate consideration. The problems of the partially sighted differ from those of the blind so special services are needed for their education and vocational guidance.

1. A recent spot check survey by the National Society for the Prevention of Blindness revealed that 1 child in 500 of the school population should be classed as partially sighted or visually handicapped. There are very good statistics available on the legally blind, but the statistics on the partially sighted are very inadequate. The need to recognize and classify this special group is great. At present, the limited vision group includes:

(a) The legally blind who use print. (b) The legally blind who use braille.

(c) The partially seeing who have a corrected vision of 20/70 or less.

(d) Any individual who requires special education or rehabilitation, in the opinion of a qualified committee.

The term "limited vision" should be expanded to include all visually handicapped who are limited either vocationally or educationally because of ocular pathology or refractive defects and who need the special services.

One of the most pressing unmet needs in the relation to the education of partially seeing children is the provision of expanded educational services. Implied in this need is the initiation of new services in many of the smaller communities and rural areas, the evaluation of present services, and the expan-

sion of services in the secondary schools.

Based on the ratio resulting from the studies made some years ago, which indicated approximately 1 child in 500 comes within the definition of partially seeing, it would appear that currently there are some 78,000 partially seeing children. Records in the office of the National Society for the Prevention of Blindness show that presently 8,200 are receiving this much needed educational service.

Connecticut has an enrollment of 447,778 schoolchildren. Based on the above ratio, it follows that 895 children need special services. At present, only five formal classes fulfill this need in the State. Joint efforts of private agencies and official groups can contribute much to the welfare of these children by

stimulating the expansion of services.

Since the partially sighted group is much larger than the legally blind the demand for qualified personnel in the specialized fields is great. There is a general shortage of specialists in this field-i.e., teachers, social workers, rehabilitation counselors, doctors, nurses, psychologists, psychiatrists.

Funds to recruit and train such personnel should be available under the

National Defense Act.

2. Since many ocular defects are readily remediable in early childhood, there is a great need of case finding in infants and preschool children with visual defects. These same defects, if not discovered early, may be resistant to all forms of treatment during the rest of the individual's life. It is recommended that Federal funds be allotted for research in the development of more adequate and effective methods of screening in these areas.

3. The usual 1- or 24-point type now being used in materials printed by the American Printing House for the Blind is not equally effective for all partially seeing persons. Research to determine what type sizes are most useful to the visually handicapped is needed. Federal funds should be allotted for this

research.

4. Federal funds to support expansion and coordination of effort in the clinical programs for the use and development of low vision aids are needed. Low vision

aids have helped many partially sighted individuals to have useful vision.

5. The lack of rehabilitation centers to provide services for the partially sighted is a serious problem which should be called to the attention of the committee. More knowledge and guidance is needed to provide appropriate services in centers where the partially sighted might have family counseling, vocational training, and a complete evaluation as an individual in his quest for independent living.

6. Provision should be made for the expansion of existing private workshops or the creation of new ones to provide remunerative employment for the partially sighted who cannot be absorbed into private industry. These workshops should provide evaluation of work potential, development of work capacity, remunerative employment, and placement.

7. There is a need for the extension of special educational supplies and equipment to service any partially seeing individual in need of some of the supplies now provided by the Government only for the legally blind. It is recommended that any visually handicapped individual requiring special services should have available all existing materials purchasable on quota account from the American

Printing House for the Blind.

8. Since there is a shortage of trained personnel needed to effectively carry out a program of education and rehabilitation for the partially sighted, it is recommended that—

(a) Federal funds in the form of grants-in-aid as scholarships, fellowships, or traineeships to colleges, universities, and specialized schools be

made available (or increased) in order to train qualified personnel.

(b) That Federal funds be allocated for financial assistance to colleges, universities, and specialized schools to include in their curriculums, essentially and specialized schools to include in their curriculums, essentially and specialized schools to include in their curriculums, essentially and specialized schools to include in their curriculums, essentially and specialized schools to include in their curriculums, essentially and specialized schools to include in their curriculums, essentially and specialized schools to include in their curriculums, essentially and specialized schools to include in their curriculums, essentially and specialized schools to include in their curriculums, essentially and specialized schools to include in their curriculums, essentially and specialized schools to include in their curriculums, essentially and specialized schools to include in their curriculums, essentially and specialized schools to include in their curriculums, essentially and specialized schools to include in their curriculums, essentially and specialized schools to include in their curriculums, essentially and specialized schools to include in their curriculums, essentially and specialized schools to include in their curriculums, essentially and specialized schools are specialized schools and specialized schools are specialized schools.

tial courses dealing with the problems of the partially seeing.

(c) That Federal funds be allotted for the provision of inservice training seminars, intensive short-term training, and workshops for practitioners in the various disciplines as well as for administrators.

9. It is the hope that our chapter and the National Society for the Prevention

of Blindness can cooperate in such needed projects as-

Those related to research:

(a) To investigate the validity of the present estimate that 1 child in 500 is partially sighted.

(b) On current teaching practices.

(c) On current educational planning and programing, to determine advantages and disadvantages.

(d) To determine the quality of present teacher preparation programs by

their on-the-job effectiveness.

(e) Continuation of the U.S. Office of Education research to determine teacher competencies.

(f) Continuing collection of statistics on the number of partially seeing children.

Those related to interprofessional education:

(a) Cooperation with the NSPB in arranging for conferences and workshops for health and education personnel to acquaint them with the educational, social, psychological, and vocational problems of the partially seeing and to provide opportunity to discuss ways and means of helping these children in schools and in preparation for job training.

Those relating to such measures as implementing:

(a) Increased funds from Government sources to permit production of greater quantities and varieties of needed educational materials such as larger type books.

(b) Provision of funds for teacher preparation scholarships and trainee-

fellowships for advanced studies in the field of the partially seeing.

Respectfully submitted for your consideration.

Mr. Elliott. This completes our list of witnesses. However, before adjourning I would like to, once again, express my sincere appreciation to Congressman Daniels, Mr. Gangemi, Sheriff Flannagan, and all of the many others here in Jersey City who have contributed so much toward making these hearings a success. I am sure I bespeak the sentiments of the entire subcommittee and our staff when I say that our stay here has been most enjoyable, enlightening, and worthwhile.

The subcommittee is now adjourned.

(Thereupon, at 4:25 p.m., the hearing was adjourned, subject to the call of the Chair.)

3-5.7-
